OVERVIEW

The Weapons Activities mission is to maintain high confidence in the safety, security, and reliability of the nation's enduring nuclear weapons stockpile within the constraints of a comprehensive test ban, utilizing a science-based approach to stockpile stewardship and management in a smaller, more efficient weapons complex infrastructure. This mission will remain as long as nuclear weapons remain a cornerstone of U.S. national security policy. Weapons Activities has three primary goals: (1) Provide high confidence in the safety, security and reliability of the U.S. stockpile to ensure the continuing effectiveness of the U.S. nuclear deterrent while simultaneously supporting U.S. arms control and nonproliferation policy; (2) Provide a small, affordable and effective production complex to provide component and weapon replacements when needed, including limited lifetime components and tritium; and (3) Provide the ability to reconstitute U.S. nuclear testing and weapon production capacities, consistent with Presidential Directives and the Nuclear Posture.

Weapons Stockpile Stewardship

The Stockpile Stewardship program will address issues of maintaining confidence in stockpile safety and reliability without underground nuclear testing through a technically challenging science-based stockpile stewardship program utilizing upgraded or new experimental and computational capabilities. The Stewardship budget continues initiatives in dynamic radiography, lasers and pulsed power, and the Accelerated Strategic Computing Initiative to acquire and use data to improve predictive capabilities which will be the foundation of the science-based stewardship approach. The request also includes second year construction funding for the National Ignition Facility and continues to transition the Technology Transfer program from cooperative research and development agreements motivated to enhance the Nation's industrial competitiveness to partnerships as a means to accomplish Stockpile Stewardship mission objectives.

Weapons Stockpile Management

Stockpile Management supports the following subprograms: Core Stockpile Management; Radiological/Nuclear Accident Response; Reconfiguration; Tritium Source; and Materials Surveillance. The Core Stockpile Management Program will maintain, evaluate, modify, improve, and dismantle warheads, bombs, and shells in accordance with the nuclear weapons stockpile plan. The Enhanced Surveillance initiative will be continued and production capabilities maintained. The Radiological/Nuclear Accident Response Program continues maintenance of DOE's technical and operational capabilities for responding to radiological accidents/incidents worldwide. The Reconfiguration Program continues consolidation of nonnuclear manufacturing activities. The Tritium Source Program includes funding to support the Department's dual-track strategy to provide an assured source of tritium. The Materials Surveillance Program provides funding for ongoing materials processing and recovery activities at Oak Ridge facilities; and materials surveillance and disposition activities at former Defense Programs sites.

Weapons Program Direction

Program Direction provides funds for personnel-related expenses, capital equipment, and contractual services for Weapons Activities. In FY 1997, all federal staffing costs and associated contractual support funding has been moved from Stockpile Stewardship and Management into Program Direction. The statutory Community Assistance Program at Los Alamos, New Mexico, is also funded in Program Direction.

The **Other Defense Activities** budget provides for the activities of the Office of Nonproliferation and National Security; Defense Environment, Safety and Health; Worker and Community Transition; Fissile Materials Disposition; International Nuclear Safety; Nuclear Security; and Naval Reactors.

Nonproliferation and Verification Research and Development

The Nonproliferation and Verification Research and Development program maintains the remote sensing and regional monitoring systems activities. The program continues to provide the technology and tools to assist in arms control treaty verification, technical intelligence collection and processing technologies, and the technologies to detect the proliferation of weapons of mass destruction. The program has assumed directed responsibility for all Comprehensive Test Ban research and development for underground, underwater, atmospheric, and space nuclear detonation detection.

Arms Control and Nonproliferation

The Arms Control and Nonproliferation program is the focal point within the Department for activities which support the President's arms control and nonproliferation policies, goals, and objectives as well as statutorily-mandated activities. The program integrates and orchestrates the Department's assets and efforts, including those of its national laboratories and contractors in accomplishing its five major program priorities: secure nuclear materials and expertise in Russia and the Newly Independent States; limit weapon-useable fissile materials; establish transparent and irreversible nuclear reductions; strengthen the nuclear nonproliferation regime; and control nuclear exports. The program provides leadership and representation for the Department in the interagency, national and international communities.

Intelligence

The Intelligence program continues to assess the activities of existing and emerging nuclear weapon states, and nuclear supplier states, and other issues such as theft and smuggling of nuclear materials in support of the Department's policy makers and Intelligence Community. The program provides technical, analytical, policy and implementation support to the efforts of the nation's policy community to deal with such complex issues as the rollback of potential proliferant programs, denuclearization of the Korean peninsula, the protection of fissile material in the Former Soviet Union and the achievement of arms control objectives, such as the Comprehensive Test Ban Treaty and the Nuclear Nonproliferation Treaty.

Nuclear Safeguards and Security

The Nuclear Safeguards and Security program provides effective policy and training for protection of the Department of Energy's nuclear weapons, nuclear materials, classified information, and facilities. The program also provides technology development, technical direction and support to domestic safeguards and security at Departmental facilities. The Declassification program implements effective classification and declassification information policies.

Security Investigations

The Security Investigations program supports background investigations for federal and contractor personnel who, in the performance of their official duties, require security clearance permitting access to Restricted Data, National Security Information, or Special Nuclear Material.

Emergency Management

The Emergency Management program provides a single point of contact and control to ensure comprehensive, integrated emergency planning, preparedness, and response programs throughout the Department; ensures an integrated Departmental response to emergencies affecting Departmental operations and activities; and provides threat assessment support to the Department's Headquarters and field operations.

Nonproliferation and National Security Program Direction

Nonproliferation and National Security Program Direction consolidates all federal staffing costs for the Office of Nonproliferation and National Security. Program Direction provides funds for personnel-related expenses, capital equipment, and contractual services.

Defense Environment, Safety and Health

The Department budgets for environment, safety and health activities in two appropriations accounts, the non-defense within Energy Supply Research and Development and the defense within Other Defense Activities. The Defense Office of Environment, Safety and Health programs will strive to continually provide improved Department-wide environment, safety and health support through: (1) consistent, multidisciplinary credible oversight processes for evaluating the effectiveness of environment, safety, health, and safeguards and security programs; and (2) epidemiologic studies that examine possible linkages between exposures or conditions at DOE sites and adverse health effects among groups of workers and off-site populations; overseeing epidemiologic studies on the health and population groups in the Marshall Islands who have been exposed to ionizing radiation; and promoting high quality workplace medical services to DOE and contractor employees. The Defense Environment, Safety and Health account is focused on Oversight and Health Studies with a separate decision unit for Program Direction.

Worker and Community Transition

The Worker and Community Transition program mitigates the impacts on workers and communities from contractor work force restructuring at defense sites, and assists community planning for defense conversion, while humanely and cost-effectively managing the transition to the reduced work force to better meet ongoing mission requirements. The program places increased emphasis on assistance for local economic development authorities, to promote rapid and effective defense conversion with new private sector jobs for displaced workers and new businesses for the community. The Worker and Community Transition program includes a separate decision unit for Program Direction.

Fissile Materials Disposition

The Fissile Materials Disposition program is responsible for the Department's technical and management activities to provide for the safe, secure, environmentally sound future storage of all weapons-usable fissile materials and the disposition of fissile materials declared surplus to national defense needs. The program is completing engineering, design, cost, schedule, nonproliferation, and environmental analyses of storage and disposition alternatives being considered in order to support a decision process resulting in a Record of Decision (ROD) for the disposition of highly enriched uranium (second quarter of 1996) and future long-term storage actions and disposition technologies for plutonium (late 1996). Follow-on activities involve: beginning the design phase for site specific long-term storage; completing the plutonium pit disassembly and conversion demonstration; and tests and research demonstrations of disposition technologies prior to implementation. The Fissile Materials Disposition program includes a separate decision unit for Program Direction.

International Nuclear Safety

The International Nuclear Safety program is designed to reduce the national security and environmental threats posed by the operation of unsafe and aging nuclear facilities around the world. Particular attention is paid to improving the safety of Soviet-designed nuclear power plants and to the shutdown of the Chernobyl plant, site of the world's worst nuclear disaster. The program also helps maintain core competencies in nuclear safety through the establishment of international nuclear safety centers in the U.S. and elsewhere, and through cooperative research and development with other countries and international organizations.

Nuclear Security

The Nuclear Security program supports efforts to reduce the threats posed by continued operation of reactors that produce weapons materials, and to promote management practices that minimize the risks of proliferation of weapons-usable nuclear materials. Particular attention is paid to implementation of the U.S.-Russian agreement to cease the production of weapons grade plutonium. Additional program elements address spent fuel management, and the safety and nonproliferation concerns related to breeder reactors in the Soviet Union.

Naval Reactors

The Naval Reactors program provides the Navy with safe, long-lived, militarily-effective nuclear propulsion plants in keeping with the Nation's defense requirements, and ensures their continued safe and reliable operation. The program efforts include supporting the fleet with over 120 operating reactors across nine different classes; continuing development of the New Attack Submarine class required by the Navy to maintain a viable submarine force and industrial base; and performing test plant (prototype) inactivation. The prototype plant inactivation effort accomplishes environmental remediation, enables Naval Reactors to obtain important core performance data, and reduces caretaker and manning costs. The Naval Reactors program includes a separate decision unit for Program Direction.

ATOMIC ENERGY DEFENSE ACTIVITIES
WEAPONS ACTIVITIES

PROPOSED APPROPRIATION LANGUAGE

For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other incidental expenses necessary for atomic energy defense weapons activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion; and the purchase of passenger motor vehicles (not to exceed [79, of which 76 are] 94 for replacement only), [including one police-type vehicle), $3,460,314,000] $3,710,000,002 to remain available until expended.

EXPLANATION OF CHANGE

Changes in appropriation language relate only to the numbers of vehicles to be acquired.

WEAPONS ACTIVITIES
EXECUTIVE BUDGET SUMMARY

VISION Maintain high confidence in the safety, security and reliability of the nation's enduring nuclear weapon stockpile within the constraints of a comprehensive test ban, utilizing a science based approach to stockpile stewardship within a smaller, more efficient weapons complex infrastructure.

STRATEGY Rely on scientific understanding and expert judgement, rather than on underground nuclear testing, and the development of new weapon designs, to predict, identify and correct problems affecting the safety and reliability of the enduring stockpile. View the stockpile life cycle as essentially a "closed loop" and develop enhanced experimental capabilities and new tools in computations, surveillance, and advanced manufacturing to meet future needs to recertify weapon safety and reliability without underground nuclear testing. Maintain, and modify weapons to remediate potential safety and reliability issues, and retire and dismantle weapons as needed to meet arms control objectives. As new tools are developed and validated, incorporate them into a smaller, cleaner, more flexible and agile weapons complex infrastructure for the future.

POLICY FRAMEWORK

Over the past several years, the United States policy governing the nuclear weapons stockpile has undergone profound change to reflect the new and evolving geopolitical and military structures of the post Cold War world. In 1992, the United States announced a halt in the production and design of new nuclear weapons and a moratorium on underground nuclear testing. In 1993 and 1994, the President and the Congress directed the Secretary of Energy to establish a stockpile stewardship program to ensure the preservation of the core intellectual and technical competencies of the United States in nuclear weapons.

In February, 1995, the Secretary of Defense submitted to the President and the Congress the Nuclear Posture Review, which established requirements for the Department of Energy related to maintaining nuclear weapons infrastructure and capabilities, and ensuring tritium availability. The requirements for DOE were stated in terms of "infrastructure to support U.S. nuclear forces," delineated specifically as follows: maintain nuclear weapon capability (without underground nuclear testing), develop a stockpile surveillance engineering base; demonstrate the capability to design, fabricate and certify weapon types in the enduring stockpile, maintain the capability to design, fabricate, and certify new warheads, maintain a science and technology base needed to support nuclear weapons, and, decide (both DoD and DOE) on a source and a production program for the tritium supply to support nuclear weapons. No new-design nuclear warhead production is required.

In August, 1995, the President announced that the United States would pursue a true zero yield Comprehensive Test Ban Treaty (CTBT) as a means of reducing the danger posed by nuclear weapons proliferation. The President outlined a series of safeguards that define the terms under which the U.S. would enter a CTBT. Safeguard A directs the conduct of the Stockpile Stewardship program to ensure the safety and reliability of the stockpile.

In January, 1996, the Senate gave overwhelming approval to the START II Treaty. The treaty ratification text highlighted the nation's commitment to proceed with a robust stockpile stewardship program, to reestablish and maintain sufficient production capabilities and capacities, to maintain the U.S. nuclear weapons laboratories and the core competencies therein to ensure rapid access to a new production source for tritium within the next decade, and to maintain the Nevada Test Site at a level which would enable timely resumption of underground nuclear testing if directed by the President.

PROGRAM OVERVIEW

The Defense Programs Stockpile Stewardship and Management Program is a single, highly integrated technical program for maintaining the safety and reliability of the U. S. nuclear stockpile that has evolved in response to these many new policies. Traditionally, the activities of the three weapons laboratories and the Nevada Test Site have been regarded somewhat separately from those of the weapon production plants. However, although there remain separate budget decision units within Weapons Activities, all stockpile stewardship and management activities have achieved a new, closer linkage to each other as evidenced in the draft Stockpile Stewardship and Management Plan and the ongoing Programmatic Environmental Impact Statement process.

There are three primary goals of the Stockpile Stewardship and Management Program:

- Provide high confidence in the safety, security and reliability of the enduring U. S. stockpile to ensure the effectiveness of the U.S. nuclear deterrent while simultaneously supporting U. S. arms control and nonproliferation policies;

- Provide an appropriately sized, affordable, environmentally sound, and effective production complex to provide component and weapon replacements when needed, including limited lifetime components and tritium; and

- Provide the ability to resume U.S. nuclear testing and reconstitute nuclear weapon production capacities, consistent with Presidential Directives, the Nuclear Posture Review and the START II Treaty, should national security so demand in the future.

In developing the programs and associated budgets to meet these goals, we assumed the "lead plus hedge" strategy articulated in the Nuclear Posture Review. Implicit in this strategy is the requirement to be able to achieve START II stockpile levels in concert with Russian stockpile reductions, while retaining the ability to reconstitute to START I levels if necessary. During the intensive Stockpile Stewardship and Management planning processes we have had underway for the past two years, strategies and programs have been developed in response to the critical issues addressing this requirement.

The Stockpile Stewardship program addresses issues of maintaining confidence in stockpile safety and reliability without underground nuclear testing through a technically challenging science based stockpile stewardship program utilizing upgraded or new experimental and computational capabilities. The Stewardship programs are planned to meet the infrastructure requirements contained in the Nuclear Posture Review. The Stewardship programs continue initiatives in archiving, and in dynamic radiography, lasers and pulsed power, and accelerate research and development in advanced computations to acquire and use data to improve predictive capabilities which will be the foundation of the science based stewardship approach.

The Stockpile Management program continues with its historical responsibilities to provide near term and long range support for the enduring stockpile, and for ensuring an adequate supply of tritium. Along with stockpile surveillance, this includes normal maintenance, corrective maintenance and system refurbishment, as well as weapon dismantlement. The programs are supportive of the infrastructure requirements cited in the Nuclear Posture Review. The DOE also has completed a Programmatic Environmental Impact Statement for tritium production, and is pursuing a dual-track approach to select a production method at a later date.

In the new paradigm of closer integration between Stockpile Stewardship and Management activities, there are also issues that will be addressed jointly. The Stewardship program will play a major role in reducing the vulnerability of the smaller stockpile to single-point and common-mode failures, principally through research base support of the new Enhanced Surveillance initiative funded in the Stockpile Management decision unit. The Stewardship and Management programs also have shared responsibilities in advanced manufacturing and systems engineering studies to integrate technological drivers such as advanced computing into an efficient and effective production complex of the future. The Dual Revalidation program, managed by Stockpile Management, will encompass both laboratories and plants in a new joint process for validating the safety, reliability and performance of the stockpile over time. Finally, the Radiological/Nuclear Accident Response program, funded by Stockpile Management, utilizes capabilities throughout the weapons complex, including weapons

expertise at the laboratories and specialized capabilities resident at the DOE facilities in Nevada.

SUMMARY OF PROGRAM CHANGES

This section highlights changes that resulted from FY 1996 Congressional action, and major changes between FY 1996 and the FY 1997 Congressional Request.

Stockpile Stewardship

Accelerated Strategic Computing Initiative (ASCI) - The FY 1996 appropriations act provided an additional $40 million over the requested $45 million for the ASCI program in FY 1996. The increase will be used to accelerate full development of 3- dimensional computer codes for safety and performance in the high energy density (secondaries) and low energy density (primaries) regimes, and initiation of computer models for selected high priority aging issues of concern for the current stockpile. We also plan to execute the second computer platform and software partnership with industry. We will also undertake full development of high speed, network based storage systems, and development of high speed classified networks among the three nuclear laboratories. The growth of $36.6 million from FY 1996 to FY 1997 continues this momentum in all aspects of the program, including planned support for a third platform and software partnership to be undertaken by the Computations and Modeling core activities in FY 1997.

Technology Transfer - The FY 1996 appropriations act provided $150 million for Technology Transfer, a decrease of $79 million below the FY 1996 request. In addition, $51 million of the $90 million prior year balances in this program have been redirected to meet the required reduction in prior year balances included in the appropriations act. All cognizant committees in both the Senate and House indicated a desire to transition and refocus these efforts to more closely support the weapons program and the future needs of the Stockpile Stewardship and Management program in advanced manufacturing and advanced computations.

The FY 1996 funding level has resulted in the early termination of some activities, as well as reductions to the scope of many other projects to permit a decrease in outyear mortgages of nearly a third. We do not expect to initiate any major new partnerships in this program in FY 1996. The FY 1997 request reduces these activities by $99.6 million, continuing the transition of completing current projects and redeploying laboratory personnel back into the mainline programs of Stockpile Stewardship and Management, particularly in the areas of advanced computations and advanced manufacturing technology.

Education - The FY 1996 appropriations act provided $10 million to continue the Education programs funded in Stockpile Stewardship, $10 million less than the request. The 50 percent reduction in the education program results in no new education initiatives, significant reduction in non-mission related projects, and reprioritization of mission related projects. The FY 1997 request continues at the $10 million level. A new initiative for a Fellowship program in the Stockpile Management program, detailed in the authorization bill, is planned to be accommodated within available stockpile management funding.

Los Alamos Neutron Science Center - The FY 1996 and FY 1997 funding allocation for this facility is $35 million.

Stockpile Management

Stockpile Management - The appropriations act provided an increase of $106 million over the request for these activities. These funds have been allocated on a basis that is responsive to the various desires of the cognizant congressional committees while reflecting the realities of the budget process and evolving mission priorities in the weapons production complex.

Tritium - The FY 1996 appropriations act included $50 million for these activities with guidance that is generally consistent between the House and Senate reports. However, several events occurred in the same time frame as the enactment of the bill that have led to a need for additional funding for tritium activities in FY 1996.

First, the 1996-2001 Nuclear Weapons Stockpile Memorandum approved by the DOE and DoD and forwarded to the White House on January 5, 1996, established the need to protect

the option of providing tritium earlier than 2011, if necessary. Second, consistent with the Secretary's Record of Decision, announced on December 6, 1995, the Department is proceeding with a dual-track strategy to assure a future tritium source. One track will explore the purchase of an operating or partially complete commercial light-water reactor (CLWR) or the purchase of irradiation services from such a reactor. The second track will be to design, build, and test critical components of an accelerator system for production of tritium (APT). The Dual Track approach expanded the planned CLWR activities from what had been requested in the FY 1996 budget. Formerly, CLWR activities were limited to developing a target that could be used for contingency production of tritium should the APT schedule slip, or to expand production beyond planned levels should the need arise. Now, both the CLWR and APT options will be developed through 1998 before a down-selection of the preferred technology is undertaken. Third, as part of the Record of Decision, if an APT facility is built, it would be located at the Savannah River Site (SRS), and an extraction facility for CLWR targets would also be built at SRS to support either the primary or backup tritium production source.

These events all contribute to a need for additional funding for tritium related activities in FY 1996, related to adding SRS site specific activities to the scope of work planned for FY 1996. Both APT and CLWR activities need to be initiated/accelerated in FY 1996 to meet the accelerated tritium need date.

Accordingly, the Department allocated $25 million of the $106 million increase provided by the appropriations act for Stockpile Management to the tritium activities. This internal change is within appropriations base table controls, and is consistent with guidance contained in the authorization act. This change will increase the Tritium total to $75 million in FY 1996. The funding is planned to be allocated as follows: Accelerator Production of Tritium ($62 million); and, Commercial Light Water Reactors ($13 million). Approximately $6 million of the $75 million appropriated is planned to initiate a CDR, supporting the accelerator alternative. The estimated cost of the CDR is $74 million as described in the notification letter to the Congress dated February 12, 1996, and is to be completed during FY 1998. We will continue to evaluate these emerging requirements during FY 1996 to determine if additional funding needs to be redirected to tritium-related activities during the year.

The FY 1997 request for Tritium activities is $100 million. The increase of $25 million over the FY 1996 level is largely to support the prime engineering contractor scheduled to be on board late in FY 1996. This contractor will lead the engineering effort for the preliminary and final design efforts and for construction activities related to the accelerator production of tritium option.

Program Direction

Defense Programs continues to move out aggressively to transform its organization for the future. Since 1992, DP has streamlined its Headquarters organization by reducing 129 FTE's and redeploying staff to meet emerging needs. Since 1993, Headquarters organizational elements have been reduced from 71 to 24, a reduction of 47 components (66 percent). Also, DP has eliminated all third tier "Division" components, resulting in a reduction of managers and supervisors from 89 to 28. The current ratio of supervisors to employees is 1:12. Contractual support was reduced about 20 percent from FY 1993 to FY 1997. Secretarial Strategic Alignment Initiative reductions to travel, information resources management, support services contracting, and employment have been factored into the FY 1997 budget request.

The FY 1997 budget request also reflects a major structure change. In FY 1996, the appropriations committees directed that each departmental entity funded by Energy and Water Development appropriations consolidate its Federal Support resources within one appropriation account. Consequently, this budget reflects the shift of Federal support expenditures for all Headquarters and Field activities from the Stockpile Stewardship and Stockpile Management decision units into the Program Direction decision unit. This has resulted in over $200 million in comparability transfers in each year, reflecting the realignment of Federal staff formerly funded in the decision unit for which they provided line program oversight. Each of the three Weapons Activities decision units contains a crosswalk table that addresses this change.

Use of Prior Year Balances

In the FY 1996 amended budget request, DP proposed to finance $98.5 million of its request for new obligational authority by redeployment of prior year balances. The appropriations act increased the use of prior year balances by $111.2 million to $209.7 million for FY 1996. This additional drawdown of end of year FY 1995 balances has resulted in DP's balances

for most programs being at or below the GAO standards (12% operating, 50% capital equipment) after adjusting for balances "protected" for specific requirements. A reduction of this magnitude cannot be accommodated by looking for program efficiencies. Rather, it results in the need to discontinue activities begun in "prior years" -- to make programmatic reductions -- to meet the appropriated reduction. Nearly half of the $111 million additional drawdown had to be absorbed by the Technology Transfer program, as discussed earlier, because most other operating programs end of year balances were already below the 12% standard needed to maintain ongoing business operations. Using the Technology Transfer program balances was only possible because of the Congressional direction and reduced appropriations which resulted in the need to rescope or terminate many ongoing activities. Capital equipment balances were reduced to no more than 50 percent, and small additional reductions were taken to some construction projects.

HIGHLIGHTS OF THE FY 1997 BUDGET REQUEST

The Stockpile Stewardship and Management programs are ending the transition period that began in 1992 with the halt of new weapons production and underground nuclear testing. As indicated in Table 1, funding available for these programs declined precipitously during this period, but has now stabilized in support of the new programs and initiatives needed to support Stockpile Stewardship and Management within the post Cold War policy framework.

Program Increases

The FY 1997 Stockpile Stewardship request is increased by 5.4 percent over FY 1996. We plan to increase funding for initiatives in the base program for computations and modeling (+$29.6 million), the Accelerated Strategic Computing Initiative (+$ 36.6 million), in lasers with the National Ignition Facility (+ $35.6 million operating and +$94.5 million construction), and in advanced hydrodynamic testing research through the LANSCE facility and with construction of the DARHT Facility. The advanced computing increase in the base program supports hardware acquisition of a computer system which will be used to meet current laboratory workload as well as provide an environment for ASCI-funded applications research. The success of the ASCI initiative depends in part on the vitality of the computations and modeling base program activities upon which it builds. The increase for ASCI is second year program funding that supports growth in all major thrusts of the program, including support for three industry partnerships for platform and software development.

The increase for the NIF construction project reflects the shift from non-site specific Title I/Preliminary Design to Title II/Final Detailed Design and pre-construction site preparation activities. Other project costs for the NIF are also increased ($+35.6 million) to support manufacturing readiness and vendor facilitization activities on the major optical components headed for NIF. Increases for advanced hydrodynamic research and development contained in the Physics subprogram (net + $9.5 million) is for technology development needed for the next generation advanced hydrodynamics facility. No FY 1997 construction funding is requested for the DARHT facility because funding previously appropriated in FY 1995 and FY 1996 for the project remains unobligated in reserve due to the work stoppage associated with the injunction. This funding will be sufficient to restart the project when the injunction is lifted and carry through until FY 1998.

Overall, the Stockpile Management request declines about 2.5 percent below FY 1996 appropriations. The program to pursue a dual track strategy leading to the selection in 1998 of a new production technology for a tritium source continues in FY 1997 (+ $ 25 million). A funding increase of $29 million is also included in the Stockpile Management account to fund the one time payment of $49 million ($10 million funded in FY 1996, $39 million in FY 1997) for DP pension fund and sales tax liabilities for the Mound and Pinellas plants, the liability for which was incurred prior to their transfer to the Assistant Secretary for Environmental Restoration and Waste Management (EM) in FY 1996.

A major new initiative, the Enhanced Surveillance Program (ESP) continues in FY 1997 (+ $25 million). The intent of the ESP is to provide advanced capability to measure , calculate and predict the effects of aging on weapons components and to extend the reliability, safety and performance of the existing weapons beyond their original design life. The three weapons laboratories and four production plants are participating in the program. A draft five year program plan is in final review. The Plan will be revised and extended in future years. The expected duration of the program is 5 to 7 years, and the annual funding commitment rises from $40 million requested in FY 1997 to $60 million in FY 1998 through FY 2000.

The increase for the Tritium activities of $25 million over the FY 1996 level is largely to support the prime engineering contractor scheduled to be on board late in FY 1996. This contractor will lead the engineering effort for the preliminary and final design efforts and for construction activities related to the accelerator production of tritium option.

Defense Programs

Historical Weapons Activities Funding
(Constant FY 1996 Dollars in Billions)

TABLE 1

The request for Program Direction increases 2.2 percent over FY 1996, reflecting the costs of downsizing the workforce and the allocation of the Working Capital Fund to DP by Departmental Administration.

Program Decreases

The only major decrease in the FY 1997 request is associated with the continuing transition of the Technology Transfer (- $99.6 million) program activities. From a separate program where cooperative research and development agreements (CRADA's) involved laboratory scientists and engineers in dual benefit research and development motivated to enhance the nation's industrial competitiveness, our new concept will utilize industrial partnerships as a means to meet the objectives of the Stewardship and Management Plan. Using partnerships in this manner allows us to leverage the vast resources of the private sector to cost share the development of the best, most efficient and most affordable technologies for the future.

Use of Prior Year Balances

Defense Programs does not plan to offset the FY 1997 request for new budget authority by the reapplication of prior year balances. As stated earlier, since 1990, Defense Programs has had a management system in place (Financial Information Variance Reporting System - FIVRS) to project and analyze program uncosted balances throughout the year. These balances are taken into account wherever possible when developing each budget request. In fact, since 1994, Defense Programs has offset the need for about $1.4 billion in new budget authority by the redeployment of prior year balances. This was possible only because of the sudden mission change for Defense Programs which resulted in significant program changes that resulted in growth of balances. Canceled and rescoped construction projects associated with the former weapons production activity provided a large portion of this uncosted balance; however, these are "one time savings" only. Once projects are rescoped or canceled and the balances redeployed, there are no more to be utilized.

As part of DP's comprehensive approach to financial management, construction project uncosted balances are reviewed monthly, and rejustified annually. We plan funding requests for projects to minimize balances wherever possible during construction, and have taken steps to accelerate contract closeout for completed projects so that the small residual balances can be redeployed as soon as final audits have been completed. At the direction of the DOE CFO, we have also eliminated the requirement for "prefinancing" for our major M&O contractors, which has allowed us to reduce operating expense balances from the formerly required 3 months' funding (over 25 percent) to less than 12 percent today. Capital Equipment balances have been drawn down significantly -- some to reflect the change and shrinkage in programmatic activities, and the rest to conform with GAO's recommended standard of no more than 50 percent. However, it is important to understand that often, uncosted balances for capital equipment are associated with long-lead equipment awaiting delivery, or delivered but not yet installed; therefore, reductions to capital equipment balances must not be made capriciously or great inefficiencies can result.

Although there is always a risk that unplanned program delays can cause growth in end of year uncosted balances, Defense Programs remains committed to monitoring, analyzing, and justifying uncosted balances which are needed for prudent business management of our programs and facilities.

Other Topics

The **Dual Revalidation** program, approved by the Nuclear Weapons Council in January, 1996, establishes a new joint process for validating, with high confidence, that the stockpile will continue to be safe and reliable and will meet its military characteristics and stockpile-to-target-sequence requirements over time (particularly in the absence of underground nuclear testing and with no new warhead development.) The W76 was selected as the first system for revalidation. Two independent design teams, an original design team comprised in part by DOE personnel from the laboratory that originally designed the system, and an independent review team comprised in part by DOE personnel from the other laboratory, will provide a baseline assessment of the health of the W76 today, and a process to uncover weaknesses that may need to be addressed in the future. Dual Revalidation is expected to take between 2 and 3 years for each stockpile weapon. The Dual Revalidation process will utilize many capabilities throughout the weapons complex, and as such will be funded as part of existing Stockpile Management and Stockpile Stewardship programs.

Our strategy for **future programs in advanced manufacturing** will be undergoing an assessment in FY 1996, leading to a comprehensive program plan projected for fall, 1996. This program, which will retain the name ADAPT, is intended to provide focus, guidance and funding support for DP activities in the development and employment of advanced design and production technologies. Specifically, we plan to develop a strategy and plan, consistent with the PEIS preferred alternative, for incorporating advanced design and production technologies into DP's reconfiguration and right-sizing efforts. In addition, we will articulate R&D goals for advanced design and production technologies. We will pursue development and transition of the highest leverage technologies into the DP production complex. We plan to apply transition products in high priority Stockpile Life Extension Programs and surveillance programs both to improve performance and to evaluate technology utility. The participants in this program will be the laboratories, the production plants, and selected industrial partners. The expected duration of the program is 8 to 10 years, commencing in FY 1998.

During FY 1997, advanced manufacturing activities will be continued through the Technology Transfer program, and as an ongoing integral component of the Core Stockpile Stewardship technology base. The expected funding level for future activities will depend upon the program plan and funding availability in the outyears.

The draft **Stockpile Stewardship and Management Programmatic Environmental Impact Statement** released on February 28, 1996, contains a blueprint for a nuclear weapons complex of the future that maintains the safety and reliability of the stockpile without underground testing, and operates more cost-efficiently and safely. Under the preferred alternative, by 2005 the nuclear weapons production complex would be one-fifth of its size at the height of the Cold War. The preferred alternative for the Stockpile Stewardship program proposes the construction and operation of the National Ignition Facility and the Contained Firing Facility at the Lawrence Livermore National Laboratory, and the ATLAS Facility at the Los Alamos National Laboratory. All three of these facilities will be used to examine different aspects of physics that are key to understanding weapon safety and reliability. The preferred alternative for the Stockpile Management program encompasses the downsizing in place of the following activities: weapons assembly/disassembly at the Pantex Plant, nonnuclear component fabrication at the Kansas City Plant, and weapons secondary and case component fabrication at the Y-12 Plant. In addition, it calls for the reestablishment of a small pit component fabrication capacity at the Los Alamos National Laboratory. At this time, there is no preferred alternative for high explosive component fabrication.

The preferred option has a number of advantages over other options analyzed. First, it is the most cost-effective solution. Second, it lowers technical risk and provides flexibility to support potential variances in stockpile size. Third, it minimizes the socioeconomic impact on the worker and communities surrounding the facilities.

The Department will conduct public hearings at each of the affected sites in March and April 1996. The comment period is expected to run through April 1996. A final Environmental Impact Statement is scheduled in July, followed by a Record of Decision in August 1996.

The impact of the announcement of the preferred alternative on the FY 1996 and FY 1997 budgets is minimal. Funding for the three Stockpile Stewardship facilities highlighted above has been programmed into the FY 1997 and outyear budget requests. Within Stockpile Management, it is expected that approximately $21 million in operating expense will be used to support pre-Title I activities over the next two years in support of the preferred alternative.

FY 1997 BUDGET ISSUES

The most significant issue facing the program in FY 1997 is the need to find the appropriate balance between the base activities and the important new initiatives throughout the budget. Historically, the strength of Defense Programs has depended in great measure on the vitality of the technology base within our laboratories which has enabled the nation to address new threats, to adjust to changing missions, and respond quickly to unexpected problems and changed circumstances. Many of the initiatives we have undertaken to allow us to transition to the science based approach to stockpile stewardship are designed to accelerate or enhance efforts ongoing in the base programs. It is essential that we not dilute the strength of the base programs while expecting these enhancements to succeed. We have included enhancements to the base computations program which are needed to underpin the accelerated research in ASCI; the success of the NIF construction project is inextricably bound to successful progress in the base ICF research and development programs; and technology base research in physics is essential to the technology development needed for the next generation hydrodynamic testing facility needed for the Stewardship program. We must continue to pursue our new initiatives, but not at the expense of the core programs upon which they build. In the transition to science based stewardship of the stockpile, the strength of a program without underground nuclear testing rests ultimately with the science base.

PROGRAM PERFORMANCE MEASURES

Program performance measures are included as an integral part of the justification for each Weapons Activities program category. Summary level performance measures for Stockpile Management and Stockpile Stewardship are included within the respective Program Mission writeups. Following are some major programmatic indicators for overall Defense Programs performance in Stockpile Stewardship and Management activities.

1. Reduce the weapons stockpile by dismantling weapons in FY 1997 without adversely affecting the environment, public safety and health.
2. Replace underground nuclear testing with science by continuing to redirect DOE weapons programs to maintain confidence in the enduring stockpile through the science based Stockpile Stewardship program.
3. Maintain the reliability of the future stockpile by developing a replacement source for tritium.
4. Determine the size and scope of the nuclear weapons complex by completing the Stockpile Stewardship and Management PEIS process.
5. Achieve Critical Decision 3 for the National Ignition Facility to begin physical construction in FY 1997.
6. Protect the FY 1998 decision point for downselection of technology for an assured source of tritium.

Victor H. Reis
Assistant Secretary for Defense Programs

3/1/96
Date

BUDGET OVERVIEW

Defense Programs' five year budget projections contained in the National Security Five Year Budget Plan FY 1996 - FY 2000 (March 1995) indicate that the Stockpile Stewardship and Management programs will require increased funding for a period of several years after FY 1996. This baseline has been modified to reflect FY 1997 program and budget decisions, but the general outlook is much the same: near term investment must be increased to transition to an appropriately sized, effective complex and to develop the new tools required to maintain confidence in the safety, security and reliability of the stockpile in the absence of underground nuclear testing. From a base of about $3.6 billion in FY 1996, the annual total may reach $4.0 billion annually by FY 1998. The Department is, however, aggressively changing the way it does business which may mitigate the growth in this curve somewhat. It is anticipated that the Department's initiatives for program and management improvements will lower the funding required during the 1997 - 2000 fiscal years.

THREE YEAR BUDGET SUMMARY ($ in Thousands)

	FY 1995 Adjusted/Comparable	FY 1996 Appropriation	FY 1996 Comparable	FY 1997 Request
Stockpile Stewardship	1,407,520	1,567,175	1,495,969	1,576,767
Stockpile Management	1,587,001	2,025,083	1,844,080	1,798,831
Program Direction	365,242	115,000	326,933	334,404
Subtotal, Directed Program	3,359,763	3,707,258	3,666,982	3,710,002
Adjustments, Use of Prior Year Balances	(147,416)	(246,944) [1]	(210,744)	--
Total, Weapons Activities (New OA)	3,212,347	3,460,314	3,456,238	3,710,002
Federal Staff (FTE)	2,177	2,126	2,126	1,997

All budgetary information for decision units in Weapons Activities is shown on a **comparable** basis to the FY 1997 request. Comparability adjustments (relating mainly to the congressionally-mandated transfer of federal support expenditures to Program Direction) and structure changes are highlighted in the overview for each decision unit.

[1] Includes $37,200,000 in Streamlining Savings directed by the appropriations act, not attributable to use of Prior Year Balances.

WEAPONS STOCKPILE STEWARDSHIP
PROGRAM MISSION

NOTE: Detailed site funding for Stockpile Stewardship is provided in the Defense Programs Executive Budget Summary.
Federal Support activities previously included in Weapons Stockpile Stewardship have been transferred to Weapons Program Direction per Congressional direction.
Construction line item details follow the Stockpile Stewardship budget narrative.

The Weapons Stockpile Stewardship Program was established for the express purpose of ensuring confidence in the Nation's nuclear deterrent. It provides direct support to the stockpile and maintains the infrastructure and technical capabilities for research, design, development, production, and maintenance of the stockpile. At the most fundamental level, Weapons Stockpile Stewardship rests on the judgment and skills of experienced civilian and military specialists, supported by appropriate experimental and computational resources, and the preservation of their knowledge base. Experience has shown that weapon systems deteriorate over time and will require modifications to extend their operational lifetime. This program is planned to enable the DOE to respond to these changes and at the same time maintain confidence in the stockpile.

GOAL:

This program will ensure, in the most cost efficient manner possible, confidence in the safety, reliability, and performance of the stockpile without nuclear testing. This will be achieved through a vigorous science-based stockpile stewardship program, consistent with the President's national security policy of negotiating a zero-yield Comprehensive Test Ban Treaty.

There are several objectives associated with maintaining confidence in the stockpile in the long term, and these provide the focus for current research and development activities in the Weapons Stockpile Stewardship Program.

- A new production capability is required to replace components and warheads for safety or reliability reasons, or to replace those destroyed in surveillance testing or other stockpile stewardship activities. These replacement units will require certification and DoD acceptance, without underground nuclear testing, before entry into the stockpile.
- The infrastructure and competency of technical personnel must be maintained through meaningful and challenging work relevant to stockpile stewardship and management.
- A meaningful experimental program must be supported at the Nevada Test Site to provide data to enhance the stewardship program, maintain necessary nuclear test skills and operations, and ensure preventive maintenance of test infrastructure and equipment.

During FY 1995, implementation of the Weapons Stockpile Stewardship program was begun with an emphasis on addressing the issues listed above. Accomplishments of particular interest included:

- Conducted weapons systems stockpile surveillance testing.
- Completed transfer of pit surveillance mission from Rocky Flats to Los Alamos.
- Expanded programs to capture and preserve the enduring weapons and weapon effects knowledge base.
- Completed Key Decision-1 (KD-1) on the National Ignition Facility (NIF) and Atlas pulsed-power facility.
- Continued studies of aging processes in weapon materials and components.
- Rehabilitated the Nevada Test Site tunnel complexes to support experiments that maintain the capability to resume underground nuclear testing.

PROGRAM MISSION - STOCKPILE STEWARDSHIP (Continued)

The **FY 1996** program will continue the ongoing activities required to maintain the stockpile and preserve the research and technology base while focusing on three new initiatives identified by the DOE as essential for a viable science-based Stockpile Stewardship Program. They are:

- Use first year funding for the Accelerated Strategic Computing Initiative (ASCI) to initiate two commercial partnerships in FY 1996 and to prepare a third for implementation in FY 1997 to create the leading-edge computational modeling and simulation capabilities that are essential for providing information to maintain the safety, reliability, and performance of the stockpile in the absence of underground nuclear testing.
- Proceed with the National Ignition Facility project following Congressional authorization and a determination by Secretary O'Leary that the project supports the nation's nuclear nonproliferation objectives.
- Begin the transition of the Los Alamos Neutron Science Center (LANSCE), which will provide new technologies for surveillance of stockpiled warheads, from Energy Research to Defense Programs.

FY 1997 will be a year of program stabilization in which we begin to look forward to what needs to be done, as opposed to the last four to five years during which the focus has been on responding to major policy shifts, such as the implementation of the moratorium on underground nuclear testing and cessation of design and production. The primary focus of activity will be on implementation of the Stockpile Stewardship and Management Plan, currently being drafted, which provides a highly integrated program plan consistent with current policy guidance.

- The stabilization of the program is confirmed by the one major programmatic shift in the FY 1997 budget request. Evolution of the program requirements of the post-cold war, post-underground nuclear testing environment of the weapons stockpile stewardship programs allows the rapid transition of the **Technology Transfer** program from private industry driven cooperative research and development agreements to Stockpile Stewardship driven or program specific projects. As such, it is not expected that any major new partnerships will be initiated in FY 1997; funding is requested mainly to support ongoing agreements. It is expected that over the next few years, the Technology Transfer line of the Stockpile Stewardship budget will quickly decrease in size as ongoing agreements are completed, leaving only a small ongoing line to fund agreements that exercise the unique capabilities of the Defense Programs laboratories and plants and are important to meeting the programmatic goals of the Department.

- Major funding changes from FY 1996 provide second year funding for the FY 1996 Stockpile Stewardship initiatives which were implemented to initiate the science based stockpile stewardship program necessary to insure continuing confidence in the nuclear weapons stockpile without the use of underground nuclear testing. The **National Ignition Facility** is fully supported with total project cost funding of $191 million; major FY 1997 activity includes beginning the procurement of long-lead items of equipment, process and technology development activities with the laser optics industry, and site-specific engineering and design activities. The **Accelerated Strategic Computing Initiative** grows from startup funding in FY 1996 of $85 million to a FY 1997 level of $121.6 million. FY 1997 ASCI funding will continue three commercial partnerships and significantly increase support of applications development. Second year construction funding is also provided for the FY 1996 new starts **Contained Firing Facility** at Lawrence Livermore National Laboratory, the **Processing and Environmental Technology Laboratory** at Sandia National Laboratories, and **ATLAS** at Los Alamos National Laboratory.

PROGRAM MISSION - STOCKPILE STEWARDSHIP (Continued)

PERFORMANCE MEASURES:

Specific performance measures for Stockpile Stewardship are included in the program element writeups on the following pages. Significant overall performance measures are:
- Select site for the National Ignition Facility and obtain official approval to proceed with physical construction of the facility.
- Have in place and implement three advanced computing partnerships.
- Proceed with an aggressive research and development program in advanced hydrodynamics.
- Support the first Life Extension Program as agreed to with the Department of Defense and outlined in the Stockpile Stewardship and Management Plan.
- Continue to transition the Technology Transfer program by utilizing industry partnerships to cost share the development of the best, most efficient, and most affordable technologies needed to meet the objectives of the Stockpile Stewardship and Management programs.

FACILITY OPERATIONS:

STOCKPILE STEWARDSHIP SITES: Weapons Stockpile Stewardship activities are conducted predominantly at the three defense laboratories, Lawrence Livermore National Laboratory in California and Los Alamos and Sandia National Laboratories in New Mexico, and at the Nevada Test Site. Funding is also provided to the University of Rochester, the Naval Research Laboratory, and General Atomics through the Inertial Confinement Fusion program and to various production sites including the Y-12 plant at Oak Ridge for Technology Transfer activities. Other miscellaneous locations are funded through the Weapons Stockpile Stewardship program as noted on the funding by location table included in the Weapons Activities Executive Summary.

Funding at the three laboratories and at the Nevada Test Site, locations at which Defense Programs acts as the Department's landlord, comprises the substantial majority of the funding available to support the research and development infrastructure. The R&D infrastructure is considerably more than the physical plant of the sites, providing the scientists and engineers and the basic and applied research base on which the health of the labs and the Test Site rest. That portion of R&D infrastructure represented by Weapons Stockpile Stewardship funded employment at the laboratories is stable going into FY 1997 with the successful implementation of the FY 1996 initiatives. This floor, or level of effort, of scientific based capability provides the ongoing technology and science resources required to insure that any Department question can be addressed by the best scientists and engineers using the most advanced sciences and technologies. This is of particular importance for the nuclear weapons stockpile activities of the Department, which is why Stockpile Stewardship funds it, but also provides the same capabilities for every other user of the laboratories and the Nevada Test Site.

Defense Programs oversees and coordinates site-wide environmental documentation activities at the three laboratories and the Nevada Test Site, as the Department's landlord, although funding is provided by all affected activities at each site. Currently, site-wide environmental impact statements (SWEIS) are underway at the Nevada Test Site and at the Los Alamos National Laboratory. The draft NTS SWEIS was provided to the public in February of this year, 1996, with the final document expected to be published later this summer. The schedule for the LANL SWEIS is to provide the public with a draft document this summer, with the final to be published late in calendar year 1996. During FY 1997 Defense Programs will conduct a five year review of the Lawrence Livermore National Laboratory SWEIS, completed in 1992, to determine if the document is current, requires revisions, or whether the site requires a new SWEIS. Defense Programs will also review ongoing and potential activities to determine the potential need for site-wide environmental documentation at the Sandia National Laboratories.

CONCEPTUAL DESIGN REPORTS and POST-CONCEPTUAL DESIGN ENGINEERING: During the budget request period, FY 1995-FY 1997, there are no Conceptual Design Reports (CDR) for new construction projects which will exceed $3 million in cost. The post-CDR engineering and design activities for the National Ignition Facility are being funded in FY 1995 and FY 1996 and will cost in excess of $6 million.

PROGRAM MISSION - STOCKPILE STEWARDSHIP (Continued)

BUDGET STRUCTURE

The Weapons Stockpile Stewardship budget request is organized in the following manner

- **SUMMARY LEVEL FUNDING DATA** is provided for all of Weapons Stockpile Stewardship followed by a funding table showing detail for capital equipment, general plant projects, and construction line items. A comparability crosswalk is provided showing adjustments to the FY 1995 and FY 1996 Weapons Stockpile Stewardship appropriations required principally to consolidate all Federal Support expenditures into the Weapons Program Direction decision unit. Funding by site and contractor employment by site are included in the Defense Programs Executive Budget Summary

- **CORE STOCKPILE STEWARDSHIP** supports the specific activities required for science-based stockpile stewardship through the maintenance of the physical and intellectual infrastructure at Lawrence Livermore National Laboratory, Los Alamos National Laboratory, Sandia National Laboratories and the Nevada Test Site. Major program elements include Programs and Initiatives, Research and Advanced Technology, and Testing Capabilities and Readiness.

- **INERTIAL CONFINEMENT FUSION** is a research and advanced technology development effort directly supporting the Department's National Security mission in Stockpile Stewardship, the program also contributes to the DOE's missions in Science and Technology, Industrial Competitiveness, and Energy Research. The near-term goal of the program is the successful demonstration of a thermonuclear ignition and moderate fusion gain in a laboratory environment

- **TECHNOLOGY TRANSFER AND EDUCATION** directly share expertise and scientific development in the laboratories with the private sector. Technology Transfer strengthens the science and technology base through participation in cooperative, dual-benefit partnerships with private industry. Education initiatives support science education activities that exercise the unique capabilities of the laboratories and the Nevada Test Site in school settings ranging from kindergarten to graduate school.

- The funding request for **MARSHALL ISLANDS** has been moved to the Other Defense Activities appropriation.

Public Law Authorization

National Defense Authorization Act for FY 1996. Public Law 104-106--February 10, 1996.

Notes

a/ Reflects transfer of federal support funding to Weapons Program Direction, per Congressional direction. Detail provided in comparability crosswalks following the Funding Schedule.
b/ Reflects effect of FY 1995 travel rescission of -$146,465 (PL 104-19)
c/ Reflects FY 1997 transfer of Marshall Islands & Dose Reconstruction to Office of Environment, Safety & Health under the Other Defense Activities Appropriation.
d/ Use of prior year balances.
e/ Reflects Stockpile Stewardship allocation of bottom line Contractor Streamlining Savings ($18,300,000).
f/ Requested use of prior year balances.
g/ Reflects internal reprogramming of $1,000,000 in prior year balances from construction line item 88-D-105, Special Nuclear Materials Laboratory Replacement to line item 95-D-102, CMR Upgrades Project.
h/ Reflects Stockpile Stewardship allocation of bottom line increased use of prior year balances ($50,766,000), per FY 1996 appropriation.

Detail and Crosscut Dollars in Thousands (continued)

FOOTNOTES

1/ "Bridge" funding (funding between completion of Conceptual Design Report and first year construction authorization) in excess of $3 million for line items requesting funding in FY 1997.

2/ Operating Project Costs for line items requesting funding in FY 1997 with a Conceptual Design Report that cost less than $3 million and which did not require "bridge" funding (funding between completion of CDR and first year construction authorization) in excess of $3 million.

3/ Previously included as a subproject within 88-D-106, NWRD&T Facilities Revitalization, Phase II.

4/ Includes $1 million internally reprogrammed from 88-D-105, Special Nuclear Material Laboratory Replacement.

COMPARABILITY CROSSWALKS - WEAPONS STOCKPILE STEWARDSHIP (Cont'd)

Notes:

1/ Funding for Emergency Response assests appropriated in Weapons Stockpile Management in FY 1996.

2/ FY 1995 shown in the FY 1996 budget structure. FY 1995 funding was originally appropriated to the Weapons Research and Development and Weapons Testing decision units.

3/ Marshall Islands & Dose Reconstruction transferred to Office of Environment Safety and Health in FY 1997 under the Other Defense Activities Appropriation.

4/ Federal Support for Los Alamos Area Office, Kirtland Area Office, Albuquerque Operations Office and Headquarters transferred to Weapons Program Direction in FY 1997.

5/ FY 1996 Internal Reprogramming: $1,000,000 in prior year balances in construction line item 88-D-105, Special Nuclear Materials Laboratory, Los Alamos National Laboratory reprogrammed to 95-D-102, CMR Upgrades, LANL.

WEAPONS STOCKPILE STEWARDSHIP

CORE STOCKPILE STEWARDSHIP

NOTE: Summary funding data is provided following the Weapons Stockpile Stewardship Program Mission Statement.

The Core Stockpile Stewardship Program maintains a high level of confidence in the safety, reliability, and performance of the U.S. stockpile in the absence of underground nuclear testing. The program provides the physical and intellectual infrastructure required to meet the programmatic requirements of the science-based Stockpile Stewardship program. Primary locations of activity are the Lawrence Livermore, Los Alamos and Sandia National Laboratories and the Nevada Test Site. The Stockpile Stewardship and Management Plan, currently in draft, will provide the primary programmatic guidance for FY 1997. Other important planning documents include the Accelerated Strategic Computing Initiative program plan, and the developing advanced hydrodynamics program plan.

PROGRAM GOALS:

- Maintain a fully capable logistics and support infrastructure for the enduring stockpile;
- Maintain an effective stockpile surveillance and evaluation program, and enhance it to provide for preventive maintenance and to offset the lack of nuclear testing;
- Continue to provide and enhance the engineering and development capabilities, including computing and experimental simulation, required to refurbish and recertify the enduring stockpile;
- Maintain the capability to resume testing, if directed, and
- Retain the ability to develop and manufacture replacement designs

SIGNIFICANT CHANGES FROM FY 1996:

- Second year funding is provided for the Accelerated Strategic Computing Initiative	+$36.6 million
- Increased computational support required by the Stockpile Stewardship program	+$29.6 million
- Enhance the support of activities to investigate the potential of advanced facilities to replace underground nuclear testing.	+$ 9.5 million
- Continue FY 1996 Construction starts:	+$ 6.0 million
- Reprioritization of ongoing activities to support the above initiatives	- $27.5 million

BUDGET CONTENTS:

The Core Stockpile Stewardship program has five major funding categories

- **PROGRAMS & INITIATIVES** supports direct stockpile support activities and other discrete, high profile initiatives.
- **RESEARCH & ADVANCED TECHNOLOGY** supports long-term science and technology required for an ongoing stockpile requirements response capability.
- **TESTING CAPABILITIES AND READINESS** ensures the continuing availability of the experimental and infrastructure capabilities of the Nevada Test Site as well as maintaining, per Presidential direction, a readiness to resume underground nuclear testing.
- **LABORATORY CAPITAL EQUIPMENT and GENERAL PLANT PROJECTS** supports the maintenance of the physical infrastructure of the laboratories.
- **CONSTRUCTION LINE ITEMS** provides line item funding for infrastructure and programmatic construction projects.

CORE STOCKPILE STEWARDSHIP

PROGRAMS & INITIATIVES: Assures the ability to support the enduring stockpile; deal effectively with major redirection in the nuclear weapons program; assure the ability to design safer weapons systems using a coordinated inter-laboratory approach; provide the technical expertise, equipment, and facilities that provide essential data in support of nuclear weapons research and development, and stockpile support missions; and provide for enhanced nonproliferation activities.

Programmatic Categories include: **DEVELOPMENT ACTIVITIES, EXPERIMENTAL ACTIVITIES, ACCELERATED STRATEGIC COMPUTING INITIATIVE, SPECIAL PROJECTS,** and **THREAT ASSESSMENT & TREATY IMPLEMENTATION COSTS.**

PROGRAM GOALS:

- Support the evaluation, maintenance, improvement, and dismantlement of the current and enduring nuclear weapons stockpile;
- Support the retention and acquisition of experimental data on all aspects of weapons components and technologies;
- Accelerate performance of computing systems to levels required to maintain the stockpile without underground nuclear testing; and
- Synergistically link the capabilities of the weapons program to the needs of the national security community.

CHANGE FROM FY 1996:

Growth from FY 1996 reflects the maturing of the Accelerated Strategic Computing Initiative activities are fully engaged in FY 1997, resulting in increased funding requirements above the FY 1996 implementation level. Additional small increases are due to increased weapon study requirements to support the enduring stockpile.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Program Category Pages):

FY 1995:	FY 1996:	FY 1997:
- Continued a number of projects generally supporting safety studies such as: Nuclear Explosive Safety Studies, Weapon Appraisal Process, Weapons System Safety Assessments and others. - Continued effort to obtain baseline data for the W76 and W80 using hydrodynamic pin shots, gas cavity radiographic tests , and aged high explosive tests. - Completed prototype fabrication, final design review and Production/Operational Readiness Review for the Weapons Transportation Safeguards Systems. - Performed design analysis of proliferant/terrorist devices using metal oxides and enriched uranium systems.	- Pursue follow on to SLBM Phase II Study to look at options needed for reliable extension of the SLBM warhead service life. - Continue design of system for a prototype retrieval/display utility for textual and graphical information. - Establish programs with industry to advance computing system capability by 100X in FY 1997. - Begin environmental monitoring of the Tritium Research Laboratory. With monitoring in place other programs can occupy the facility and use it as general laboratory space. - Explore disablement effectiveness of a high-energy electron beam and study the feasibility of an accelerator and other speed-of-light disablement techniques.	- Complete W55 and W79 dismantlement. Begin W56 dismantlement as the first SS21 (seamless safety) example. - Capture and document, in a usable form, weapons design information for the development of safe dismantlement operations at Pantex and disassembly operations at Y-12. - Complete first versions of virtual prototyping codes and demonstrate minimal capability in manufacturing and aging analysis. - Final completion of the Tritium Research Laboratory project will depend upon the results of monitoring programs. If monitored tritium levels stay below the determined threshold for one year then monitoring may be discontinued.

FUNDING LEVELS:

$255,733	$340,755	$361,385

CORE STOCKPILE STEWARDSHIP-*Programs & Initiatives Summary*

DEVELOPMENT ACTIVITIES provide for preproduction design and engineering activities including initial design and development of all new weapon designs, if needed; the design and development of weapon modifications; the technical aspects of the surveillance laboratory and flight test program; the analysis behind safety studies and assessments; studies and research to apply basic science to weapon problems producing new technologies, products and processes; command and control and surety (safety, security, and use control) technology development and implementation; and the analysis needed to dismantle and safely store or destroy weapons being removed from the stockpile.

Programmatic Subcategories include: **Stockpile Readiness Program, Enduring Stockpile Program, Future Stockpile Program,** and **Stockpile Reduction Program.**

PROGRAM GOALS:

- Support the evaluation and maintenance of nuclear weapons in the active and inactive stockpile;
- Identify and respond to performance and safety issues associated with the stockpile;
- Ensure the availability of technologies required for the support of the enduring stockpile; and
- Ensure weapons dismantlements are timely, safe, and secure.

CHANGE FROM FY 1996:

Program changes from FY 1996 include increases in the Nuclear Explosive Safety Studies/Seamless Safety 21 efforts, coordination with the Weapons Stockpile Management enhanced surveillance program and a study for SLBM Warhead Protection. B61 modification 335 and 339 are expected to transition into production in FY 1997 and reduce the need for development funding for that effort.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Development Activities Detail):

FY 1995:	FY 1996:	FY 1997:
- Continued a number of projects generally supporting safety studies such as: Nuclear Explosive Safety Studies, Weapon Appraisal Process, Weapons System Safety Assessments and others. - W87 Life Extension Program developed structural modifications for the physics design and analyzed the environments and loads associated with transitioning to a single warhead launch platform. - Continued AT-400A pit storage container development (fixtures for W48, W55, and W56).	- Complete development of B61-11 modification for Stratcom. - Continue development of W87 Life Extension Program to maintain viability of stockpile weapon. - SLBM Warhead Protection Program is based on the results of the SLBM Phase II Study. This cooperative effort studies design options needed to ensure the reliable extension of the SLBM warheads service life and maintain the design team expertise and capability.	- Continue to develop and evaluate enhanced diagnostic techniques for characterization of aging effects in stockpiled systems and begin characterization for predictive models. - Continue Pit Fire Resistance/Ceramic Coated Pits effort to evaluate techniques for increased fire resistance in weapons. - Complete W55 and W79 dismantlement. Begin W56 dismantlement as the first SS21 (Seamless Safety) example.

FUNDING LEVELS:

$144,565	$151,463	$147,910

STOCKPILE READINESS PROGRAM focuses on the development efforts for all day-to-day activities supporting the evaluation and maintenance of nuclear weapons in the active and inactive stockpile. The range of activities include analysis and technical support during production, assembly, and dismantlement; surveillance testing (both laboratory and flight); required safety assessments; development of weapon-specific technologies, products and processes needed by the production complex, particularly to enhance the surveillance process; and liaison activities with the Department of Defense, particularly through Project Officers Groups and the Nuclear Weapons Council. These activities are primarily devoted to safety studies mandated by external agencies.

MEASURABLE PERFORMANCE ACTIVITIES (Development Activities Stockpile Readiness Program Detail):

FY 1995	FY 1996:	FY 1997:
- Completed a number of projects generally supporting surety studies such as: Nuclear Explosive Safety Studies, Weapon Appraisal Process, Weapons System Safety Assessments and others. Most are required by DOE orders, or external regulation and agencies. - Undertook Enhanced Surveillance projects by the individual laboratories to gain a better understanding of the effects of extended service life upon weapons. - Secure PAL (Permissive Action Link) Recode Systems established requirements and began development of the Theater Secure Recode System for deployment in US EUROPEAN COMMAND prior to the failure of existing system. - Performed Aircraft Compatibility Tests: B-2, F-16, PA200 weapons drop and vibration tests accomplished. - Demonstrated several aspects of W88, W87, and W80 High Fidelity Joint Test Assemblies.	- Perform Aircraft Compatibility Tests: B-2, Block 20. - Develop models and conduct tests on Explosives Behavior in low shock/slow heat and other abnormal environments. - Begin implementation of seamless safety at Pantex on the Enduring Stockpile. - Conduct studies to support the development of recertification and validation of existing weapons.	- Continue to develop and evaluate enhanced diagnostic techniques for characterization of aging effects in stockpiled systems and begin characterization for predictive models. - Continue Multicode coded switch Encryption Translator (MET) implementation. - Continue models development and tests on Explosives Behavior in low shock/slow heat and other abnormal environments. - Begin and complete Navy Weapon System Safety Assessment. - Complete Fire Resistance Enhancement Phase III. - Complete B52H Study. - Begin implementation of the Joint Surety Plan. - Conduct studies in detonation science.

FUNDING LEVELS:

$45,481	$45,431	$44,855

ENDURING STOCKPILE PROGRAM is focused in two areas. "Stockpile Improvements" support sanctioned weapon-specific development activities intended to go on into a production phase. "Stockpile Options" support more generalized weapons-specific technology explorations to form a basis for later stockpile improvement programs or provide proof of concept for further development. Currently, programs are focused on extending the lifespan of the weapons planned for the enduring stockpile, or in the case of the B53, modifying a current weapon to be a suitable replacement when it is withdrawn from service. The B61-11 and the Submarine Launched Ballistic Missile (SLBM) studies are the major new studies started in FY 1996. The High Power Radio Frequency (HPRF) study is expected to be closed out by the end of FY 1995.

MEASURABLE PERFORMANCE ACTIVITIES (Development Activities Enduring Stockpile Program Details):

FY 1995:	FY 1996:	FY 1997:
- B61 ALT 335 and 339 modifications to include modern nuclear safety features into the active B61-3,4,10 stockpile and to integrate MultiCoded Coded Switch Encryption Translator encryption devices. - W87 Life Extension Program developed structural modifications for the physics design and analyzed the environments and loads associated with transitioning to a single warhead launch platform. - B83 Quality Improvement Program continued development of new radar and qualification activities for B-2 bomber, including electrical simulation model. - Completed the Tri-Lab B61 Enhanced Surety Assessment. - Demonstrated pit reuse options for weapons in the enduring stockpile. - Completed HPRF Phase II study.	- B61-11 Program will develop the structural design modifications for its replacement. - SLBM Warhead Protection Program is based on the results of the SLBM Phase II Study. This cooperative effort studies design options needed to ensure the reliable extension of the SLBM warheads service life and maintain the design team expertise and capability. - Conduct design layouts and feasibility study of B61 Surety Enhancements identified in FY 1995 study. -Initiate an Advanced Microelectronic Project. - W76, W78, and W88 Development support focuses on development of new limited life components (neutron generators etc.) needed to extend the stockpile life of these enduring systems.	- Continue B61-11 Program. Deliver first production unit kit for B61-11t. - Continue to develop design options for the SLBM warhead. - Support development of new boost systems and related tritium handling to replace the existing designs. - Conduct other weapon studies as requested by the Department of Defense. - Continue development of W87 Life Extension Program to maintain viability of stockpile weapon.

FUNDING LEVELS:

$63,746	$64,844	$62,875

FUTURE STOCKPILE PROGRAM supports nonweapon-specific research into enhanced surety and future technologies. Enhanced surety is focused on the development and implementation of technologies to improve safety, security, and use control. Future technology development is directed at the development of new processes or technologies to improve reliability, performance, or other aspects of the weapons to extend their serviceability. New, more secure, and less sensitive firesets are one of the principal areas of investigation.

MEASURABLE PERFORMANCE ACTIVITIES (Development Activities Future Stockpile Program Detail)

FY 1995:	FY 1996:	FY 1997:
- In the Pit Fire Resistance/Ceramic Coated Pits effort evaluated environments and techniques useful to provide increased fire resistance in enduring stockpile weapons - Detonation systems research provided the design, engineering and development of new technologies which would be used as safety improvements in the enduring stockpile. - Established project level requirements for the B61-3/4/10 Stockpile Upgrade Project. - Demonstrated process for application of a fire-resistant coating. - Demonstrated small build production capabilities. - Completed Phase Two experimental tests of hardware for vulnerability to EMP.	- Establish weaponization requirements for advanced detonation systems. - Pursue advanced safety and use control technologies. - Demonstrated compatibility and containment of fire resistant coatings. - Perform analysis of "self-aware" weapon systems.	- Evaluate surety and cost benefits for alternate technologies for enhancing surety in the enduring stockpile. - Continue Pit Fire Resistance/Ceramic Coated Pits effort to evaluate environments and techniques useful to provide increased fire resistance in enduring stockpile weapons. - Continue to study detonation systems which provide the design, engineering and development of new technologies which would be used as safety improvements in the enduring stockpile.

FUNDING LEVELS:

$24,801	$30,939	$30,145

STOCKPILE REDUCTION PROGRAM provides laboratory support for the timely, safe, and secure disassembly of U.S. weapons. The retirement of large numbers of older stockpile weapon systems has lead to an increased emphasis on compliance with current environmental, safety and health requirements and to the design of disassembly processes and tooling to meet modern safety standards. The Stockpile Stewardship laboratories provide support of disposal and storage efforts at Pantex and Y-12 and provide development of advanced technologies to improve dismantlement operations.

MEASURABLE PERFORMANCE ACTIVITIES (Development Activities Stockpile Reduction Program Detail):

FY 1995:	FY 1996:	FY 1997:
- Completed dismantlement of W68, W70, and W71 warheads. - Restarted W48 dismantlement. - Prepared for W55, W56, and W79 dismantlement, with W56 as the first SS21 (Seamless Safety) example. - Continued contamination evaluation of closed military bases. - Continued AT-400A pit storage container development (fixtures for W48, W55, and W56). - Supported first dismantlement unit of B61-0. - Supported Pantex in the development of alternate disposal methods for high explosives. Delivered W79 HE dissolution workstation. - Completed first phase of information management network (Straight-Line).	- Complete W48 dismantlement. - Begin W55 and W79 dismantlement. Continue to prepare W56 as the first SS21 (Seamless Safety) example. - Implement a base hydrolysis HE disposal pilot project at Pantex. - Issue the B53 SS21 safety specification. - Complete the B69 dismantlement preparation by the "Seamless Safety" process. - Expand the Straight-Line network to operational sites including Pantex and Sandia National Laboratories.	- Complete W55 and W79 dismantlement. - Begin W56 dismantlement as the first SS21 (Seamless Safety) example. - Continue contamination evaluation of closed military bases. - Continue AT-400A pit storage container development support for dismantlement schedule. - Begin to prepare W62 for dismantlement.

FUNDING LEVELS:

$10,537	$10,249	$10,035

EXPERIMENTAL ACTIVITIES provides data to maintain certification of the current stockpile through experiments using high explosives and may use special nuclear material. These experiments are conducted at the national laboratories and at the Nevada Test Site. These experiments directly support, although are not driven by, Presidential direction to maintain the ability to conduct an underground nuclear test at the Nevada Test Site. Funding to provide support by the Nevada Test Site contractors of these experiments is included in the **Testing Capabilities and Readiness** budget category.

Programmatic Subcategories include: **Archiving, Nuclear Component Assessment,** and **Nonnuclear Component Assessment.**

PROGRAM GOALS:

- Identify, analyze, and archive critical information on weapons design, testing and production from retiring laboratory and Nevada Test Site personnel,
- Support the acquisition of new experimental data on the physics of nuclear components to allow certification of those components,
- Experimentally test nonnuclear components to insure their ability to withstand high levels of radiation experienced during the lifecycle of a nuclear weapon.

CHANGE FROM FY 1996:

There are no major changes in this program from FY 1996 to FY 1997. Program remains at a level of effort necessary to provide data required to support the enduring nuclear weapons stockpile.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Experimental Activities Detail):

FY 1995:	FY 1996:	FY 1997:
- Retrieved, actively reviewed, and stabilized engineering and underground test methods and data for all operational and technical areas involved in past underground nuclear testing.	- Continue efforts in the design of a demonstration system for a prototype retrieval/display utility for textual and graphical information.	- Capture and document, in a usable form, weapons design information for the development of safe dismantlement operations at Pantex and disassembly operations at Y-12.
- Continued effort to obtain baseline data for the W76, W80 and W88 using hydrodynamic pin shots, gas cavity radiographic tests, and aged high explosive tests.	- Hydrodynamic experiments are to be conducted to obtain data for stockpile system primaries including W76, W80, W84, and W89, and to evaluate safety upgrade options for stockpile system primaries.	- Complete development for double pulsed PHERMEX to supply increased radiographic information on hydrodynamic experiments.
- Continued radiation transport code improvements and benchmark code performance run-time and storage optimization.	- Complete development of 3-D Internal Electromagnetic Pulse studies and begin to validate the new 3-D, deterministic radiation transport code.	- Experiments in z-pinch physics will be conducted on the modified Particle Beam Fusion Accelerator (PBFA-IIZ) to enable validation of hot plasma scaling laws and conduct key source development research.

FUNDING LEVELS:

$55,878	$55,290	$54,150

ARCHIVING: The purpose of the DP Nuclear Weapons Archiving Program is to identify and preserve information on stockpile weapon design parameters, production and engineering data, and data from nuclear and nonnuclear tests in order to facilitate certification of the current stockpile weapons. Many activities focus on identification, analysis, and archiving of information from retiring weapon designers, production specialists, and computational model specialists. This information and data are preserved and used for analysis of current stockpile weapons and their effects; support of proliferation analysis; critical information for emergency response; training future scientists, engineers, and technicians; and preserving information for reconstitution.

MEASURABLE PERFORMANCE ACTIVITIES (Experimental Activities Archiving Detail)

FY 1995:	FY 1996:	FY 1997:
- Continued the effort of archiving underground nuclear test, weapon design, and production data. - Retrieved, actively reviewed, and stabilized engineering and underground test methods and data for all operational and technical areas involved in past underground nuclear testing. - Continued the Knowledge Preservation Project to capture, in retrievable form, undocumented nuclear weapon component design information. - Continued sponsorship of data archiving workshops with participation from the weapons laboratories and the production sites. - Finished the recovery and stabilization of all relevant data related to the W76. Begin a similar effort for the B61.	- Retrieve, actively review and stabilize engineering and underground test methods and data for all operational and technical areas involved in past underground nuclear testing. - Continue efforts in the design of a demonstration system for a prototype retrieval/display utility for textual and graphical information. - Continue the Knowledge Preservation Project. - Will apply Livermore Archiving Mosaic Platform (LAMP) to test operation technologies as the archiving medium for LLNL, the Joint Testing Organization, and DOE/NV archiving programs. - Complete 3 year effort to transfer NTS seismic data from magnetic tapes to modern formats.	- Continue the Knowledge Preservation Project. - Capture and document, in a usable form, NTS contractor engineering and underground test methods and data for all operational, safety, and technical areas involved in past underground nuclear testing. - Capture and document, in a usable form, weapons design information for the development of safe dismantlement operations at Pantex and disassembly operations at Y-12. - Continue to evaluate with modern calculation tools nuclear weapons information from nuclear tests and hydrodynamic experiments.

FUNDING LEVELS:

$13,378	$15,866	$15,735

NUCLEAR COMPONENT ASSESSMENT The performance of modern nuclear weapons depends on complex physical phenomena, many of which are incompletely understood. Underground nuclear testing established the experimental basis for improved understanding of the physics occurring within a nuclear weapon. Data obtained from experiments in underground tests were used to benchmark computer codes. With the moratorium on underground nuclear testing, scientists and engineers are working on experiments using hydrodynamic techniques with and without special nuclear material to assess a limited dimension of physical phenomena. These experiments allow laboratory personnel to compare experimental data with data from prior underground nuclear tests in order to validate or modify computational codes. This experimental process involves stockpile nuclear components, diagnostic instrumentation, analysis, and fielding and is vital to maintaining expertise to certify the nuclear stockpile. These experiments are also important to learn more about the nuclear stockpile as it ages past its originally intended lifetime.

MEASURABLE PERFORMANCE ACTIVITIES (Experimental Activities Nuclear Component Assessment Detail):

FY 1995:	FY 1996:	FY 1997:
- Continued effort to obtain baseline data for the W76, W80 and W88 using hydrodynamic pin shots, gas cavity radiographic tests , and aged high explosive tests. - Physics analysis of proposed design options for the W87 Life Extension Program were carried out with UGT data. - Developed a longlife neutron tube for use in Neutron Generator Components. The resulting Generators will have a longer shelf life, while still meeting needs of the Stockpile Stewardship program. - Conducted the Kismet experiment at the NTS Lyner Site. The experiment verified the containment characterization of Lyner, tested diagnostics for use in hydrodynamic experiments, and provided a means to demonstrate test readiness.	- W87 Life Extension Program will continue with major effort to rework and modernize the W87 modeling processes with improved physics and complete material definition. Effort will continue into FY 1997. - Hydrodynamic experiments are to be conducted to obtain data for stockpile system primaries including W76, W80, W84, and W89, and to evaluate safety upgrade options for stockpile system primaries. - Continue development of 20-beam velocimeter and gamma ray camera to obtain improved experimental data return. - Experiments are to be conducted to obtain additional material property data on special nuclear property data to improve computer analysis.	- Hydrodynamic experiments will be conducted to obtain baseline data for stockpile system primaries including W76 and W80. - Hydrodynamic experiments will be conducted on a W76 using aged components to investigate possible effects of aging on system performance. - Hydrodynamic experiments will be conducted to obtain fundamental properties data on plutonium and uranium to improve understanding and calculational modeling of stockpiled nuclear weapons. - Hydrodynamic experiments will be conducted to normalize calculational models needed to assess nuclear safety. - Complete development for double pulsed PHERMEX to supply increased radiographic information on hydrodynamic experiments.

FUNDING LEVELS:

$38,600	$35,417	$34,415

CORE STOCKPILE STEWARDSHIP-*PROGRAMS & INITIATIVES*-Experimental Activities Detail (2 of 3)

NONNUCLEAR COMPONENT ASSESSMENT: Aboveground experiments are used to assess and certify nonnuclear stockpile weapon subsystems and component hardware to the effects of neutron, x-ray and gamma-radiation. Correlation of underground nuclear testing data with radiation simulator data is applied to understand electronic and material responses and enhance protocols for testing and certification of components, subsystems, and systems. Experiments with high-energy density plasmas provide basic hohlraum temperature versus scaling law validation and x-ray data that support development of advanced simulation capability critical to future certification efforts of nonnuclear components.

MEASURABLE PERFORMANCE ACTIVITIES (Experimental Activities Nonnuclear Component Assessment Detail):

FY 1995:	FY 1996:	FY 1997:
- Planned and continued preparation for arming and firing (A&F) procurement. - Maintained adequate materials for participation on any type of permitted experiment at the Nevada Test Site. - Continued development of the Particle Beam Fusion Accelerator (PBFA) and pulsed power module to enable high energy density and scaling law experiments. - Continued radiation transport code improvements and benchmark code performance run-time and storage optimization. - Continued development of three dimensional Internal Electromagnetic Pulse (IEMP) studies to validate the new 3-D, deterministic radiation transport code. - Single Event Upset tests were performed at the SPR Facility and demonstrated reactor-driven heavy ion source single event effects in a commercial SRAM.	- Continue preparation for arming and firing procurement and maintenance of materials for any type of permitted experiment or underground test, should it be required. - Continue to maintain and upgrade Saturn, HERMES III, and SPR III. - Complete radiation transport code improvements and benchmark of code performance run-time and storage optimization. - Complete development of 3-D Internal Electromagnetic Pulse studies and begin to validate the new 3-D, deterministic radiation transport code. - Modification of the Particle Beam Fusion Accelerator (PBFA-II) will be completed, and advanced pulsed power will continue. Initial z-pinch experiments begin and will be completed in FY 1997 to validate the hot plasma scaling laws, conduct key source development research, and develop the engineering necessary to transport required energy levels along a magnetically insulated transmission line.	- Validation protocols for both electronics and materials will be applied to new designs for replacement hardware and subsystems in maintaining the stockpile. Also applications of IEMP circuit response codes in combined Transient Radiation Effects on Electronics (TREE)/IEMP testing continue. Work will also continue on assessing aged components in the enduring stockpile. - Experiments in z-pinch physics will be conducted on the modified Particle Beam Fusion Accelerator (PBFA-IIZ). Experiments with advanced pulsed power technologies will continue. This will enable validation of hot plasma scaling laws, conduct key source development research, and develop and establish the engineering necessary to store and transport required energy levels for future applications.

FUNDING LEVELS:

$3,900	$4,007	$4,000

ACCELERATED STRATEGIC COMPUTING INITIATIVE: ASCI is a 15 year program (FY 1996 - 2010) supporting Defense Programs' response to the Presidential decision to pursue a zero yield Comprehensive Test Ban treaty. ASCI is a balanced program to accelerate the development of simulation codes, computer platforms and computing environments needed to address the challenges of credibly simulating the performance, safety, and reliability of the enduring nuclear stockpile. ASCI works closely with the U.S. industry to accelerate its plans to provide computer systems far exceeding current industry projections, but essential to Stockpile Stewardship. ASCI will engage U.S. universities on critical simulation capability problems addressing physics, materials modeling, and computer science issues. ASCI builds on and accelerates efforts found in the Computation and Modeling program.

PROGRAM GOALS:
- Create 3-D, full systems virtual testing and prototyping ability based on advanced weapon codes and high performance computing.
- Develop a credible path to allow confidence in the abilities of computers to simulate "real world" events.
- Work with the computing and software industry to accelerate performance and storage trends in computing systems.
- Provide the needed ability to analyze, evaluate, maintain, and prototype nuclear weapons and weapons components.

CHANGE FROM FY 1996:
Increased funding in FY 1997 continues support of 3 partnerships with industry, increases the number of applications development projects, and accelerates the development of computer environments (e.g., programming tools, networks, storage systems, visualization) to support the development and use of the advanced applications.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
There was no activity in this category in FY 1995. Activities begin in FY 1996.	- Demonstrate a 10x better virtual testing capability in safety and hydro code algorithms for massively parallel computers. - Establish multiple joint programs with computing and software industry to advance computing system capability in ASCI by 100X in FY 1997. - Establish focused effort for explosion codes which treat high energy density physics and low energy density physics in a coupled way and with high fidelity and three dimensional geometries. - Initiate virtual prototyping models to support safety codes, pit production, and surveillance. - Install the first high speed, secure network among the three weapon labs and enable direct access from the three-labs to highly parallel computer systems.	- Install first ever common software approach and initial software tools for code development and use at labs. - Combine and install latest encryption technology and high speed network to connect application teams with world's most advanced computers. - Demonstrate an increase of 100X over weapons codes through a combination of better simulation capability and improved computer platform performance. - Demonstrate an improved capability in the area of materials aging with additional physics and fidelity. - Initiate advanced physics models in 3-D in important implosion/explosion phase of nuclear weapons operation. - Complete first versions of virtual prototyping codes and demonstrate minimal capability in manufacturing and aging analysis.

FUNDING LEVELS:

$0	$85,000	$121,615

SPECIAL PROJECTS: This budget category provides for unique miscellaneous research and development and support activities necessary to carry out the Weapons Stockpile Stewardship program, but which do not programmatically fit into any other category. Federal support activities previously included in this category have been moved to the Weapons Program Direction decision unit.

Programmatic Subcategories include: **Weapons Transportation Safeguards Systems**, **Extraordinary ES&H Site Remediation**, **Joint DoD/DOE Munitions Technology Development Program,** and **Other Activities**.

PROGRAM GOALS:

- Develop and prototype the SafeGuards Transporter for ground transportation of weapons and special nuclear materials,
- Complete one-time prioritized environmental corrective actions, particularly the Propellants, Explosives, and Pyrotechnics Evaluation and Reapplications (PEPER) project and the cleanup of the Tritium Research Laboratory (TRL),
- Cooperate with DoD on R&D in areas of mutual interest including energetic materials, electronics, and warhead technology,

CHANGE FROM FY 1996:

The Weapons Transportation Safeguards Systems transitions from a research and development project to a production activity, and the cleanup of the Tritium Research Laboratory moves into a monitoring program for unexpected residual tritium releases.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Special Projects Detail)

FY 1995:	FY 1996:	FY 1997:
- Completed prototype fabrication, final design review and Production/Operational Readiness Review for the Weapons Transportation Safeguards Systems.	- Complete development of the SafeGuards Transporter Facilitate transition from research and development effort to active production capability.	- Final completion of the TRL project will depend upon the results of ongoing monitoring programs. If monitored tritium levels stay below the determined threshold for one year then monitoring may be discontinued.
- Began transitioning the Tritium Research Laboratory (TRL) at Sandia National Laboratory in Livermore, California (SNL/CA) for other uses. Completed the removal of accountable tritium and determined the residual tritium to be less than 1000 Curies.	- Per an agreement with the State of California's Environmental Protection Agency, begin environmental monitoring of the Tritium Research Laboratory. With monitoring in place other programs can occupy the facility and use it as general laboratory space.	- Implement improved DDT model into CTH hydrothermal code; insert a multiple velocity DDT model into the CTH code and benchmark it with available data.
- Developed new capability for high strain rate testing under tensile loads to use in conjunction with a high energy electron beam for rapid heating of test sample.	- Continue development work of next generation thermochemical code CHEETAH; begin beta testing with DoD.	

FUNDING LEVELS:

$35,198	$30,365	$19,530

WEAPONS TRANSPORTATION SAFEGUARDS SYSTEMS was an effort to develop and prototype the SafeGuards Transporter to replace the 20 year old Safe Secure Transport for ground transportation of weapons and special nuclear materials. This effort transitions to a production effort funded within Weapons Stockpile Management in FY 1997.

CHANGE FROM FY 1996:
Technology research and development efforts on the Weapons Transportation Safeguards Systems ended in FY 1996 with no remaining activities in FY 1997. Production units of the trailers is included in the **Weapons Stockpile Management** request.

MEASURABLE PERFORMANCE ACTIVITIES (Special Projects/Weapons Transportation Safeguards Systems Detail):

FY 1995	FY 1996	FY 1997
- Efforts to enhance geographic based vehicle tracking system evaluated extendibility and improved query response time using the spatial index, and demonstrated real-time graphical user interface. - Prototype fabrication, final design review and Production/Operational Readiness Review completed. Delivery of first production unit scheduled. - Continued effort in transportation risk assessment. Efforts included statistical descriptions of heavy truck accident severities and analysis of the plutonium dispersal for accidents involving SGT designs.	- Complete development of the Safeguards Transporter. - Facilitate transition from research and development effort to active production capability. - Support delivery of first production units.	- No research and development activity continues in this category.

FUNDING LEVELS:

$7,001	$4,000	$0

EXTRAORDINARY ES&H SITE REMEDIATION focuses on completing significant one-time prioritized corrective actions that do not meet the funding criteria of Environmental Restoration and Waste Management. These actions are the responsibility of Defense Programs, the landlord at Sandia National Laboratories. Two of the larger projects have been the Propellants, Explosives, and Pyrotechnics Evaluation and Reapplications (PEPER) project and the cleanup of the Tritium Research Laboratory (TRL). There is also an ongoing program to remove asbestos from various buildings. PEPER, completed in FY 1995, disposed of several hundred excess rocket motors stored at Sandia Technical Area 3. TRL work will continue through FY 1997. Final completion of the TRL project will depend upon the results of monitoring programs intended to confirm that residual tritium is not being released to the environment. Remediation of the TRL involved the removal of potentially contaminated equipment, decontamination and the performance of radiological surveys. The objective is to retain the use of the building as general laboratory space with initial occupancy scheduled for FY 1996.

CHANGE FROM FY 1996:
Funding decrease from FY 1996 reflects the completion of active remediation of the Tritium Research Laboratory with only monitoring for residual tritium occurring in FY 1997. Asbestos decontamination and demolition continues at same level of effort.

MEASURABLE PERFORMANCE ACTIVITIES (Special Projects Extraordinary ES&H Site Remediation Detail):

FY 1995:	FY 1996:	FY 1997:
- Completed the Propellants, Explosives, and Pyrotechnics Evaluation and Reapplication (PEPER) project to place SNL into compliance with DOE Explosive Safety Manual. PEPER disposed of several hundred excess rocket motors. - Began transitioning the Tritium Research Laboratory (TRL) at Sandia National Laboratory in Livermore, California (SNL/CA) for other uses. Completed the removal of accountable tritium and determined the residual tritium to be less than 1000 Curies. - Continued asbestos cleanup of SNL buildings 805 and 869. Performed site/building audits to prioritize facilities for cleanup and determined which facilities could be reused and which facilities should be demolished.	- Complete the site characterization and stabilization of radioactive hazards at TRL. Clean the exhaust ventilation system. Remove potentially contaminated equipment and decontaminate it as necessary prior to disposal. Per an agreement with the State of California's Environmental Protection Agency, begin environmental monitoring. With monitoring in place other programs can occupy the facility and use it as general laboratory space. - Complete asbestos cleanup of the basements of SNL buildings 805 and 869 with the intent to reuse the space. Clean up and demolish wooden framed buildings 844 and 845. Perform site/building audits and provide program support to determine which facilities need to be cleaned up.	- Continue environmental monitoring at TRL. If for one year of monitoring, which begins in FY 1996, the emission of tritium stays below the determined threshold then monitoring may be discontinued. Final completion of the TRL project will depend upon the results of monitoring programs. - Continue asbestos cleanup and demolition of SNL buildings 9830B, 863, 906, 950, and 951. Continue to prioritize facilities for asbestos cleanup.

FUNDING LEVELS:

$7,700	$3,900	$2,100

JOINT DOD/DOE MUNITIONS TECHNOLOGY DEVELOPMENT PROGRAM: This program, operating under the auspices of the Non-Nuclear Munitions Technology Memorandum of Understanding (MOU) between the Department of Defense (DoD) and the DOE, represents a leveraging of funds and resources to improve the capabilities of nonnuclear munitions. Matching funds from the two departments support a cooperative program of research and development in areas of mutual interest between the DoD and DOE including energetic materials, electronics, warhead technology, and a variety of supporting technologies. Activities in this category are coordinated through a five year plan that is updated and aproved annually by both agencies.

MEASURABLE PERFORMANCE ACTIVITIES (Special Projects Joint DOD DOE Munitions Technology Development Program Detail):

FY 1995:	FY 1996:	FY 1997:
- Measured mechanical properties for a range of explosives to support development of behavior models of damaged explosives behavior. - Expanded the national warhead materials database to include refractors W and Mo. - Developed new capability for high strain rate testing under tensile loads to use in conjunction with a high energy electron beam for rapid heating of samples. - Incorporated chemical reactions and thermodynamic models into the integrated hydrocode ALE3D to delineate the fundamental mechanisms associated with initiation in the energetic materials when the confined system is subject to dynamic loadings. - The Molten Salt Destruction process for hazardous organic waste disposition was demonstrated effective, environmentally acceptable, and safe for over 25 separate materials, including difficult DoD pyrotechnic smokes and dyes. Agreement was reached to transition technology to Army and Air Force facilities.	- Implement improved deflagration to detonation transition (DDT) model into CTH hydrothermal code, investigate wave nature of reactive, nonequilibrium multiphase flows and advanced numerical techniques for predicting DDT. - Develop improvements in the underlying science of thermochemical code CHEETAH; begin beta testing with DoD. - Utilizing very high speed photography (IC Camera), observe the origin of copper jet surface structure during shaped-charge detonation to determine its relation to jet stability. - Complete penetrator dynamic reaction modeling in concrete; incorporate data to allow study of non-ideal applications of multistage and ballistic penetrator munitions. - Pursue accurate temperature measurements of shaped charge jets to benchmark the computations of the jet formation and elongation process.	- Implement improved DDT model into CTH hydrothermal code; insert a multiple velocity DDT model into the CTH code and benchmark it with available DoD/DOE data. - Beta test newest version of CHEETAH code with DoD; incorporate updated kinetics and new condensed and gaseous equations of state. - Develop and apply high resolution optics as a tool for studying shaped-charge jet formation; utilize infrared imaging system to compliment IC camera use. - Conduct research in demil technologies (base hydrolysis, supercritical water oxidation, molten salt, cryocycling and biotreatment) for HE and other types of hazardous waste; design and construct a pilot biotreatment system for DoD; forecast cryocycling capability for demil inventory; demonstrate molten salt technology throughput/demonstrate large scale safety considerations/operate a pilot plant/transfer same to DoD or industrial operator.

FUNDING LEVELS:

$13,403	$14,496	$14,880

FEDERAL SUPPORT provided for federal oversight of Lawrence Livermore National Laboratory through the Oakland Operations Office (Lawrence Livermore Site Office), the Los Alamos National Laboratory through the Los Alamos Area Office and of Sandia National Laboratories (Albuquerque) through the Kirtland Area Office, and programmatic oversight of the Nevada Test Site and the North Las Vegas Facility through the Nevada Operations Office. Another major activity is ongoing support of the (County of) Los Alamos Firefighters. **Consistent with Congressional direction, funding for this activity in FY 1997 is being requested within Weapons Program Direction.** FY 1995 and FY 1996 funding is also shown in Weapons Program Direction. Crosswalks showing where changes in the location of funding for federal personnel between Weapons Activities decisions units have occurred to implement the Congressional guidance are included in the Weapons Program decision unit; a summary crosswalk table is provided following the Stockpile Stewardship program funding profile.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
- Continued support for the Los Alamos Area Office, Kirtland Area Office, Nevada Operations Office, (County of) Los Alamos Firefighters, and Oakland Operations Office. **Funding appropriated for this activity in Weapons Stockpile Stewardship is shown in Weapons Program Direction.**	- Continue support for the Los Alamos Area Office, Kirtland Area Office, Nevada Operations Office, (County of) Los Alamos Firefighters, and Oakland Operations Office. - Begin implementation of Department of Energy Strategic Alignment Initiatives, as they apply to Stockpile Stewardship federal oversight. Continue with reductions of staff and support contracts at the Los Alamos and Kirtland Area Offices and the Nevada Operations Office as appropriate **Funding appropriated for this activity in Weapons Stockpile Stewardship is shown in Weapons Program Direction.**	- Consistent with Congressional guidance, funding for federal support activities associated with the Weapons Stockpile Stewardship program are transferred to Weapons Program Direction.

FUNDING LEVELS:

$0	$0	$0

OTHER ACTIVITIES provides for miscellaneous activities required to support the ongoing Stockpile Stewardship program. This includes ongoing research and development support activities with other federal agencies, such as the National Institute of Science and Technology. Activities also include small one-time efforts that do not fit easily into other budget categories and for which special visibility is required, such as the environmental impact statement for the Dual-Axis Radiographic Hydrotest Facility at Los Alamos National Laboratory.

CHANGE FROM FY 1996:
There are no major changes in this program from FY 1996 to FY 1997.

MEASURABLE PERFORMANCE ACTIVITIES (Special Projects Other Activities Detail)

FY 1995	FY 1996	FY 1997
- Proceeded with a remedial environmental impact statement for the Dual-Axis Radiographic Hydrotest Facility (DARHT) at Los Alamos National Laboratory. The record of decision (ROD) supported continuing with the construction of the facility and implementing a program phased containment of the firing site.	- Support of legal activities associated with the injunction against proceeding with construction of DARHT will continue.	- Continue miscellaneous support as required to maintain the flexibility of the Stockpile Stewardship program.

FUNDING LEVELS:

$7,094	$7,969	$2,550

THREAT ASSESSMENT AND TREATY IMPLEMENTATION: These activities focus on forging a link between other national security programs and the core nuclear weapon stewardship programs. They provide Defense Programs with an assessment of the future threat environment (technical, political, arms control, etc.) in which its nuclear weapon stewardship mission will be carried out. They also include technology research on surprise proliferation response technologies.

PROGRAM GOALS:

- Synergistically link the capabilities of the weapons program to the needs of the national security community.
- Increase knowledge in major program elements including systems studies, intelligence-related systems research, proliferation-related information management, knowledge preservation, and proliferation training to allow treaty implementation with full knowledge of potential implications.

CHANGE FROM FY 1996:

There are no major changes in this program from FY 1996 to FY 1997. Program remains at a level of effort necessary to support and maintain required research and development activities.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Continued efforts to develop verification computer models. Reviewed existing test data including one point experiments and computational models of one point tests and calculated verification of the experiments.	- Develop proliferation response technologies to include assessments of possible proliferator/terrorist weapon designs, studies of weapon disablement techniques, and diagnostic technologies.	- Examine potential advanced technical capabilities within permitted experimental regimes. Examine simulation capabilities associated with non-verifiable areas of technology advance.
- Investigated designs of shaped charges which optimize mass and speed in new ways.	- Support limited Russian and Ukrainian technical exchanges and collaborations.	- Continue analysis and experimental determinations of foreign capabilities that could impact U.S. capability to maintain the enduring stockpile.
- Performed design analysis of proliferant/terrorist devices using metal oxides and enriched uranium systems.	- Explore disablement effectiveness of a high-energy electron beam and study the feasibility of an accelerator and other speed-of-light disablement techniques.	- Continue to develop and test hardware that might have serious technical impacts on U.S. ability to continue Stockpile Stewardship and experimentally evaluate the level of such impacts.
- Continued to perform technical proliferation assessments addressing key issues that effect the security, storage, and disposition of weapons and nuclear materials.		

FUNDING LEVELS:

$20,092	$18,637	$18,180

CORE RESEARCH AND ADVANCED TECHNOLOGY provides the science and technology infrastructure, including technical expertise and facilities, needed to support Department of Energy (DOE) defense missions, programs, and initiatives. Emphasis is placed on those research and technology development activities necessary (a) to maintain and improve the understanding of the underpinning science of complex nuclear weapons systems and subsystems and (b) to advance the enabling technologies used in their design, assessment, engineering, production, certification, surveillance, dismantlement, and disposal. It sustains the DOE defense core competencies and core technologies which provide the principal opportunities for assistance to the private sector both in technology and product development and in advanced manufacturing capabilities. The draft "Weapons Core Research Program Plan" provides the planning basis for this activity.

Programmatic Categories include: **Design Assessment Science & Technology, Systems and Components Science & Technology,** and **Chemistry and Materials Science & Technology.**

PROGRAM GOALS:

- Explore concepts, facilities, and technologies that offer options for meeting all future requirements of the enduring stockpile;
- Demonstrate and incorporate new technologies and materials that insure the long-term health, safety and reliability of the stockpile;
- Accelerate the technological growth curve and take advantage of advances to achieve environmental, safety, health and financial savings throughout the life cycle of all stockpile weapons.

CHANGE FROM FY 1996:

Changes from FY 1996 driven by increased Core Stockpile Stewardship program use of the Nova laser, increased emphasis on developing advanced hydrodynamic capabilities, preparation for use of the National Ignition Facility, and insuring that all three laboratories achieve advanced computing capabilities to support implementation of the Accelerated Strategic Computing Initiative.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Program Category Pages):

FY 1995:	FY 1996:	FY 1997:
- Continued development of methods for characterization of stockpile pits and to improve ability to project future changes in material properties, esp. plutonium.	- Use the Los Alamos Neutron Science Center to begin study of high-explosives microstructure and aging effects using small-angle neutron scattering.	-Ensure that all three laboratories are able to take full, immediate advantage of the near-term advances achieved through the Accelerated Strategic Computing Initiative.
- Tested technology for an Advanced Hydrotest Facility, including the development of a full inductive adder power modulator.	- Conduct research in integrated systems for use control/security applications; advanced nondestructive testing and evaluation techniques; stress measurements inside metals; and advanced surveillance methodologies.	- Continue the development of non-invasive assay techniques for plutonium and uranium in storage and support design concepts to reduce worker exposure during storage operations.
- Explored virtual reality computer tools relevant to assembly and dismantlement to assess use for direct application.	- Characterize performance and sensitivity of aging explosives as part of surveillance of the enduring stockpile.	- Continue Advanced Hydrotest Facility development activities including development of physics design requirements and research of potential pulse power machine technologies.

FUNDING LEVELS:

$428,484	$440,049	$474,090

DESIGN ASSESSMENT SCIENCE & TECHNOLOGY: These elements, commonly dealing with theoretical research, heavily physics-oriented, and computationally intensive, emphasize anticipated future national security missions and requirements.

Programmatic Subcategories include **Conceptual Design and Assessment, Physics, Los Alamos Neutron Science Center,** and **Computation and Modeling**.

PROGRAM GOALS:

- Explore concepts and technologies that offer options for meeting future national security requirements and missions;
- Support basic weapons physics research for components, radiation source development, improved diagnostics and facilities;
- Take advantage of LANSCE's ability to provide critical data in the detection of small-scale material defects; and
- Support the development and maintenance of simulation codes for research in physics, mathematical modeling, and software.

CHANGE FROM FY 1996:

Changes from FY 1996 are increases in the areas of Physics and Computation and Modeling due to increased research and development to take advantage of the experimental capabilities of the Nova Laser and the capabilities that could be available for Core Stockpile Stewardship with the construction of the National Ignition Facility; enhanced efforts on developing advanced hydrodynamic capabilities and ensuring all three laboratories achieve advanced computational capability.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Design Assessment Science & Technology Detail):

FY 1995:	FY 1996:	FY 1997:
- Completed preliminary designs for pulsed power and laser experiments to determine correlations between physics regimes available in aboveground experiments and by underground tests. - Tested technology for an Advanced Hydrotest Facility, including a full inductive adder power modulator. - Constructed experiments to show feasibility of temperature measurements in initiated high explosives with single-pulses of resonance energy neutrons. - Several codes were modified to operate on scientific workstations to explore whether workstations might be an effective alternative to supercomputers for 2D simulations.	- Provide design support for stockpile improvements. - Provide support for advanced design technology assessments. - Use above ground experimental results and other available data to benchmark hydrodynamic algorithms in computer codes. - Use the Los Alamos Neutron Science Center to begin study of high-explosives microstructure and aging effects using small-angle neutron scattering. - Maintain computational capabilities including hardware support, operations support, software support, and client services.	- Experimentally study high explosive equation of state over a broad range of pressure and volume. - Continue Advanced Hydrotest Facility development activities including development of physics design requirements and research of potential pulse power machine technologies. - Use the Los Alamos Neutron Science Center to continue development of texture measurements as quality signatures and performance indicators for weapon components. - Provide for the placement of a third "first-generation-ASCI" capable computer at the laboratories. This will ensure that all three laboratories are able to take full, immediate advantage of the near-term advances achieved through the Accelerated Strategic Computing Initiative.

FUNDING LEVELS:

$260,289	$277,460	$315,665

CONCEPTUAL DESIGN AND ASSESSMENT: Exploration of concepts and technologies that offer potential options for meeting future national security requirements and missions. Although these activities do not involve formal hardware development, they may include a limited amount of prototyping or experimentation to assess or demonstrate conceptual feasibility. They often require intensive computational analysis. Current areas of interest include, but are not limited to advanced electromagnetic radiation, stealth, and enhanced safety features such as fire resistant pits (FRP), insensitive high explosives (IHE), insertable nuclear components, paste explosives, and advanced containment.

MEASURABLE PERFORMANCE ACTIVITIES (Design and Assessment Science & Technology Conceptual Design and Assessment Detail):

FY 1995:	FY 1996:	FY 1997
- Completed the campaign of ejecta experiments investigating primary performance and reliability. - Completed preliminary designs for pulsed power and laser experiments to determine whether correlations exist between the physics regimes available in aboveground experiments and those regimes accessed by underground nuclear tests. - Reanalyzed the underground test data for the B83 and the W76 with modern calculational tools. - Performed a radiographic core-punch experiment in order to study the late time convergence behavior of the W87 primary. - Smooth Particle Hydrodynamics has been incorporated into the PRONTO finite element code yielding a new, unique capability. SPH is a gridless Lagrangian method that offers the capability to model very high deformation impulsive loading events.	- Provide design support for stockpile improvements, assist in theoretical modeling efforts for the enduring stockpile and technology demonstrations. - Provide support for advanced design technology assessments; assist in evaluation of component revision, and participate in efforts to improve the ability to relate analyses to enduring stockpile issues. - Provide support for device disablement assessments; acquire hydrodynamic data; and participate in efforts to develop specialized disablement techniques. - Provide assistance in archiving efforts to baseline the enduring stockpile.	- Perform weapons analysis and experiments for future stockpile options; conduct equation-of-state benchmark experiments. - Conduct fundamental boost physics experiments; investigate critical fundamental issues with advanced diagnostics. - Integrate benchmark hydrodynamic tests with advanced evaluation tools; support development of programmatically useful radiography at NTS. - Experimentally study high explosive equation of state studies over a broad range of pressure and volume space.

FUNDING LEVELS:

$33,953	$31,339	$35,455

PHYSICS: Supports basic weapons physics research for both nuclear and nonnuclear components, radiation source development, development of improved diagnostics for use in aboveground experimental facilities, and upgrades to those facilities. Physics issues involving hydrodynamics, radiation physics, plasma physics, nuclear physics, solid state physics, optical physics, and chemical physics are being addressed, providing for important physics understanding, code validation, and sustaining the skills of theoretical and experimental scientists. Modeling studies complement the physics effort by using important inertial fusion facilities to conduct weapons-related physics experiments.

MEASURABLE PERFORMANCE ACTIVITIES (Design and Assessment Science & Technology Physics Detail)

FY 1995:	FY 1996	FY 1997
- Conducted radiation flow experiments using the record yields of soft x-rays from Procyon source. - Tested advanced radiation source-target approaches for direct drive x-ray production on both Pegasus and Procyon. - Developed models and fielded diagnostic systems on advanced pulsed power radiation source experiments to prepare for developing designs for Atlas targets. - Tested technology necessary for an Advanced Hydrotest Facility, including the development of a full inductive adder power modulator, and development of an electromagnetic code for simulating electron beam propagation in non-linear lines. - Filled gaps between LANL and LLNL U hugoniot data using explosively-driven flyers. - Completed plans for FXR Double Pulse Upgrade which will provide 2 x-ray beams on the same axis, but separated 1 to 5 microseconds in time.	- Perform experiments to correlate above ground experiments with underground test results. - Use above ground experimental results and other available data to benchmark hydrodynamic algorithms in computer codes. - Develop theoretical improvements of energy transport within and radiation output of devices in the stockpile. - Continue Advanced Hydrotest Facility development activities. - Complete measurements of aluminum ejecta particulate size and velocity distributions in vacuum as a function of surface finish. Explore particulate distribution behavior for one or more additional materials as a function of surface finish at similar shock conditions. Begin characterization of behavior of ejecta launched into high pressure gas.	- Perform actinide equation-of-state calculation and experiments. - Measure and calculate material opacity. - Continue to develop radiation sources for weapons physics applications. - Continue construction support of the Dual-Axis Radiographic Hydrotest Facility with the implementation of the environmental impact statement decision of record following judicial review of enviornmental impact statement.. - Continue Advanced Hydrotest Facility development activities including: -- Development of initial physics design requirements for the potential facility. -- Preliminary design activities for advanced research pulse power machines required to evaluate competing technologies for inclusion in facility design.

FUNDING LEVELS:

$120,207	$120,548	$125,905

LOS ALAMOS NEUTRON SCIENCE CENTER (LANSCE) The LANSCE facility provides a new source of critical data in the detection of small-scale material defects which might serve as indicators of weapon component aging (deterioration/damage) and in the prediction of material performance. Activities include testing the concept of fast neutron radiography of weapon system major components, temperature measurement in shock-insulted explosives using a unique probe based on neutron resonance absorption, spatially-resolved measurements of strain in materials of importance in weapons manufacture, and determination of bulk texture of materials.

MEASURABLE PERFORMANCE ACTIVITIES (Design and Assessment Science & Technology Los Alamos Neutron Science Center Detail):

FY 1995:	FY 1996:	FY 1997:
In FY 1995, the LANSCE facility was operated by the Office of Energy Research (ER). Defense Programs used the facility on a per-test basis. - Refined technology for advanced surveillance with neutron radiography. - Constructed experiments to demonstrate feasibility of temperature measurements in initiated high explosives with single-pulses of resonance energy neutrons. - Prepared experiments bearing on equation-of-state issues for plutonium and other weapon engineering materials. - Began measurements aimed at characterizing material textures in stockpile return and new-process weapon components. - Studied residual strain in welded joints.	In FY 1996 Defense Programs assumes management responsibility for the LANSCE facility from ER. - Explore tomographic methods and perform benchmark measurements for advanced surveillance with neutron radiography. - Investigate potential of single-pulse resonance-energy neutron measurements for temperature and other measurements in small-scale experiments intended to explore weapons hydrodynamics. - Continue experiments on weapons materials equations of state. Work on measurements of Pu elastic constraints and Debye-Waller factors using high-pressure diamond-anvil cell. Begin experimental development effort for Pu phonon measurements. - Begin study of high-explosives microstructure and aging effects using small-angle neutron scattering.	- Carry out a stockpile surveillance experiment using high-energy neutron radiography. - Use single-pulse temperature measurement techniques to study a range of issues important to the science of high explosives. - Continue equations-of-state studies. First phase of plutonium phonon dispersion curve measurements. - Continue small-angle neutron scattering studies of high-explosives aging. - Continue development of texture measurements as quality signatures and performance indicators for weapon components. - Continue development of capabilities for study of residual strain in welds. Perform benchmark experiments. - Continue helium bubble ingrowth studies. Work toward development of a still more sensitive technique.

FUNDING LEVELS:

$7,000	$35,000	$34,160

COMPUTATION AND MODELING: Supports the development, enhancement, and maintenance of simulation codes and databases for the weapons program and research in theoretical physics, mathematical modeling, software and algorithms. With the President's decision to pursue a Zero-yield Comprehensive Test Ban Treaty, computational simulation of nuclear events has become the critical core element of weapon predictive capability and Science-Based Stockpile Stewardship. These activities are essential in weapon safety and reliability assessments, stockpile life extension endeavors, design of physics experiments, developing appropriate diagnostics, and analyzing past nuclear experimental results. Areas of current interest include: assessments of complex/unique accident scenarios; improvements of predictive capability for weapon safety and performance analysis, particularly in support of Science-Based Stockpile Stewardship; improvement in weapon materials dynamic response models; multi-dimensional simulation of physics; visualization tool; and robotics algorithms. Core Computation and Modeling is managed to be consistent with, and supportive of, developments achieved through the Accelerated Strategic Computing Initiative (ASCI).

MEASURABLE PERFORMANCE ACTIVITIES (Design and Assessment Science & Technology/Computation and Modeling Detail):

FY 1995:	FY 1996:	FY 1997:
- Prototyped encryption engine that is scalable and in the gigabit transmission range to support "classified" or "sensitive" high performance computing data transmission over public networks. - Emphasis has been placed on broadening the applicability of design codes so that they can also simulate physics regimes achievable by AGEX facilities. Initial implementation of Adaptive Mesh refinement methods has increased capability to simulate AGEX experiments. - Several 2D weapons codes were modified to operate on scientific workstations. This effort is exploring whether workstations might be an effective alternative to vector supercomputers for 2D simulations. - The SMARTEPANTS/DAVINCI Codes can now communicate through software that translates their respective outputs. The codes have been validated on 1D models and are now being used to study 3D effects parametrically.	- Maintain computational capabilities including hardware support, operations support, software support, and client services. - Perform assessments of complex or unique accident scenarios. - Continue code development to emphasize development and validation of physics models necessary to simulate AGEX experiments with codes that have traditionally been used for weapons design and analysis. Goals are to maximize information obtained from AGEX experiments and to better relate AGEX data to design issues. - Initiate Stewardship Barn Book project that will reevaluate and document with uncertainties nuclear reactions to form a prioritized list developed in conjunction with primary and secondary designers. The Stewardship Barn Book will serve as a foundation for the nuclear sensitivity studies related to SBSS issues.	- Continue code development activities to improve the physics models, numerical solution algorithms, and computer science techniques for the weapons design, analysis, and output codes in support of the other elements of the Stockpile Stewardship Program. This includes, but is not limited to: safety, performance, reliability, and vulnerability assessments in support of stockpile surveillance and engineering design/development programs; support for weapons physics and other experiments conducted as part of the AGEX and ICF experimental program; and support for the review and analysis of historical data. - Provide for the placement of a third "first-generation-ASCI" capable computer at the laboratories. This will ensure that all three laboratories are able to take full, immediate advantage of the near-term advances achieved through the Accelerated Strategic Computing Initiative. - Transfer production computation tasks for the DP program onto the high performance computing platforms.

FUNDING LEVELS:

$99,129	$90,573	$120,145

SYSTEMS COMPONENTS SCIENCE & TECHNOLOGY: This category supports research program elements which emphasize the integration of warhead systems with delivery systems, and advancement of subsystem enabling technologies. Research includes component modularity, standardization, and reuse; utilization of microelectronic systems to improve safety, security and reliability, and development of the tools, methods, and processes needed to support future design and manufacturing requirements.

Programmatic Subcategories include: **Systems Engineering, Electronics, Photonics, Sensors & Mechanical Components,** and **Advanced Manufacturing.**

PROGRAM GOALS:

- Incorporate new technologies into weapon systems and stockpile support operations.
- Support improved command and control, performance instrumentation, safing, arming, fusing and firing.
- Provide intelligent systems that diagnose the condition of weapons with regard to aging, functional status, intrusion/tamper detection, and anticipated performance.
- Develop and qualify advanced processes for materials and components.

CHANGE FROM FY 1996:

Maintains support for use of computer-based models, selective enhancement of unique test facilities for evaluation of model prediction, and integration of model-based development of manufacturing processes into the early stages of engineering.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Systems Components Science & Technology Detail)

FY 1995:	FY 1996:	FY 1997:
- Explored virtual reality computer tools relevant to assembly and dismantlement to assess direct application use. - Researched models describing advanced single-mode fiber optic star coupler for high capacity information network applications. - Collaborated on development of gamma-ray detectors for a nuclear spectroscopy facility for applications requiring detailed knowledge of nuclear properties. Conducted experiments to demonstrate characteristics of these detectors. - Micromachined combustible gas sensor, designed a control circuit to maintain the filament at constant temperature, and tested with gas mixture.	- Conduct research in integrated systems for use control/security applications, advanced nondestructive testing and evaluation techniques, stress measurements inside metals, and advanced surveillance methodologies. - Research safety assessment and engineering of weapons systems, including development of predictive response to abnormal environments. - Extend vertical-cavity photonic devices to wavelengths suitable for fiber-optic communications and demonstrate 1.3 to 1.7 micron wavelength devices; "native oxide" fabrication technology will be extended to facilitate the demonstration of new photonic device concepts.	- Retain and selectively enhance environmental test facilities for evaluating model predictions to certify performance and assess safety. - Evaluate weapons and components in combined environments (e.g. heat plus shock). - Continue to develop high reliability, low-volume electronics to replace sunset technologies for stockpile maintenance and enable the self-aware weapon. - Develop quick-turn prototypes for special ICs, sensors, and micromachines. - Investigate an integrated engineering design environment. Focus will include direct links from design to the production floor.

FUNDING LEVELS:

$109,564	$106,467	$103,745

SYSTEMS ENGINEERING: Facilitates the incorporation of new technologies into weapon systems and stockpile support operations; demonstration of emerging technologies; and supports improved command and control, performance instrumentation, safing, arming, fusing and firing. These activities sustain capabilities required for the monitoring and assessment of new technologies, command structures, new stockpile configurations, and external threats. Major program focus is on interfacing with a mix of commercial vendor design, analysis, and manufacturing systems to explore component standardization, modularity, and reuse for the manufacture of small-lot, ultra-high reliability components and subsystems, reducing both costs and waste generation.

MEASURABLE PERFORMANCE ACTIVITIES (Systems and Components Science & Technology/System Engineering Detail):

FY 1995:	FY 1996:	FY 1997:
- Developed computer solid models for multipart systems for analysis/design; plastic parts will be produced to evaluate assembly capabilities. - Explored virtual reality computer tools relevant to assembly and dismantlement to assess direct application use. - Researched models describing single-mode fiberoptic star coupler for high capacity network applications. - Collaborated on development of gamma-ray detectors for a nuclear spectroscopy facility for applications requiring detailed knowledge of nuclear properties. Conducted experiments to demonstrate characteristics of these detectors. - Continued development of a new isotopic analytical tool with particle induced emission and accelerator mass spectrometry. Tool opens the possibility to analyze all isotopes and allow detection of SNM at ultra-low levels.	- Develop low cost, smart process access and design; controlled vapor deposition software; advanced failure models, mesh generation, and visualization software; predictive models for fiber optics in radiation environments; cluster recognition techniques and UV fluorescence remote sensing; and advanced visualization techniques to display material defects. - Conduct research in integrated systems for use control/security applications; advanced nondestructive testing and evaluation techniques; stress measurements inside metals; and advanced surveillance methodologies. - Research safety assessment and engineering of weapons systems, including development of predictive response to abnormal environments. - Conduct studies of reliability, surety, quality control, and lifetime extension of materials in the stockpile.	- Evaluate safety and reliability of weapon systems when exposed to a wide range of abnormal environments with computer-based models. - Integrate model-based development of manufacturing processes into the early stages of engineering. - Retain and selectively enhance environmental test facilities for evaluating model predictions to certify performance and assess safety. - Evaluate weapons and components in combined environments (e.g. heat plus shock). - Incorporate expert systems for design and production into search engines for historical weapons data, information, and knowledge.

FUNDING LEVELS:

$60,550	$60,939	$60,800

ELECTRONICS, PHOTONICS, SENSORS & MECHANICAL COMPONENTS. Research in the enabling technologies for components and subsystems which control and operate nuclear weapons; and in intelligent systems that monitor and diagnose the condition of weapons with regard to aging, functional status, intrusion/tamper detection, and anticipated performance. Emphasis is on devices used in conjunction with microelectronic systems offering improved safety, security, reliability, and information processing; improved safety in abnormal environments; enhanced command and control; automated monitoring and inventory control; command disablement; and intelligent manufacturing based on the use of robotics.

MEASURABLE PERFORMANCE ACTIVITIES (Systems and Components Science & Technology Electronics, Photonics, Sensors & Mechanical Componenets Detail):

FY 1995:	FY 1996:	FY 1997:
- Developed a robust chemical vapor deposition process for vertical-cavity surface-emitting lasers, ultra-high-mobility metal-organic vapor-phase epitaxy materials for nanoelectronic devices, and metal-organic vapor-phase epitaxial InP-based materials and initiated development of gas-source molecular beam epitaxial InP-based materials. - Demonstrated meshed involute IMEMS gears and high aspect ratio micromachines, the fabrication of a functioning pressure sensor, and the development of single crystal MEMS Technology and an IMEMS combustible gas detector. - A pattern-recognition algorithm was used to discriminate binary mixtures of gases and vapors, realizing a ninety-three percent accuracy. - Fabricated and tested a micromachined combustible gas sensor, designed a control circuit to maintain the filament at constant temperature, and tested with gas mixture.	- Extend vertical-cavity photonic devices to wavelengths suitable for fiber-optic communications and demonstrate 1.3 to 1.7 micron wavelength devices; "native oxide" fabrication technology will be extended to facilitate the demonstration of new photonic device concepts. - Construct a radiation spectrometer consisting of an array of RadFETs with varying metal film thicknesses on each device to act as an energy filter and an array of combustible gas sensors using micromachined filaments. Investigate new sensors using catalytically-coated FETs and UV sources to decompose organic compounds in water and cause pH change. Develop packaging methods for volatile organic sensors. - Develop comprehensive chemically reacting flow models of Si and/or compound semiconductor CVD processes, demonstrate modeling capabilities with applications to design a state-of-the-art CVD reactor, and demonstrate real-time process control using *in situ* process monitors and active feedback.	- Maintain a defense microelectronics core competency for safety, surety, and use control of nuclear stockpile aligned with commercial technology for production in the future. - Develop high reliability, low-volume electronics to replace sunset technologies for stockpile maintenance and enable the self-aware weapon. - Develop quick-turn prototypes for special ICS, sensors, and micromachines for defense needs. - Develop optoelectronics for high-data rate communications. - Provide a continuing investment for maintaining the supplier of last resort for radiation-hardened electronics.

FUNDING LEVELS:

$36,222	$33,223	$30,410

ADVANCED MANUFACTURING: Advanced Manufacturing develops the tools, methods, and processes needed to support future design and manufacturing requirements. This activity comprises core activities in manufacturing, materials, intelligent systems and machines, and components research, and contributes the science base to enable the development and deployment of cost effective, environmentally acceptable product realization technologies, processes, and methods in direct support of the nuclear weapons stockpile. The DP overall goal is to provide alternatives to using large facilities and replace them with modern infrastructure, using modern information technology and model-based design and development technologies.

MEASURABLE PERFORMANCE ACTIVITIES (Systems and Components Science & Technology/Advanced Manufacturing Detail):

FY 1995:	FY 1996:	FY 1997:
Contributed to the implementation planning for the ADaPT program. Supporting activities took place including:	-Exploit advanced computer/sensor/process technologies to enable maximum understanding and control of key weapon manufacturing processes and to enable embedding of process intelligence in the design phase of product realization cycles.	- Complete development of a set of materials and process advisors consisting of integrated knowledge bases, process models and materials performance data bases.
- Developed a logic engine for process knowledge bases.	- Begin development of a product realization system that yields reliable components and subsystems with reasonably fast cycle time using commercial materials, components, processes and manufacturing.	- Investigate an integrated engineering design environment. Focus will include direct links from design to the production floor.
- Produced an alpha engineering design system to understand the issues and to explore concepts of prototype system gas transfer component design.	- Develop advanced engineering models and computer design of materials response for manufacturing applications.	- Develop models for product and process simulation; emphasis will be on key processes for nuclear and non-nuclear components.

FUNDING LEVELS:

$12,792	$12,305	$12,535

79

CHEMISTRY AND MATERIALS SCIENCE & TECHNOLOGY: The specialized materials developed and used in nuclear weapons and their reliability requirements have created a unique set of materials science challenges. These activities are required to address the resolution of aging and reliability issues of weapons, and support remanufacture of components in a timely, cost effective, and environmentally benign way.

Programmatic Subcategories include: **Chemistry and Materials, High Explosives, Special Nuclear Materials,** and **Tritium.**

PROGRAM GOALS:
- Maintenance of engineering competence in materials science.
- Development of models to study aging phenomena; and
- Development of alternative materials to reduce environmental, safety and health concerns

CHANGE FROM FY 1996:
There are no major changes in this program from FY 1996 to FY 1997. Program remains at a level of effort necessary to support and maintain required research and development capabilities.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Chemistry and Materials Science & Technology Detail):

FY 1995:	FY 1996:	FY 1997:
- Initiate experiment to measure permeability of vadose zone gases in LYNER through the Joint Test Organization to look at transport pathways of interest to containment and to groundwater recharge. - Continued study of coupled thermal-chemical-mechanical code LYNX2D to insert into ALE3D code to establish a thermal-chemical-mechanical-hydrodynamic capability. - Continued development of methods for characterization of stockpile pits and to improve ability to project future changes in material properties, especially plutonium. - Continued tritium consolidation by moving SNL Tritium Research Lab's tritium function stations to LANL's Weapons Experimental Tritium Facility.	- SmartCeramics Project will continue the development of a 3D model for ceramic compaction to be used to improve the homogeneity of ceramic compacts and reduce defect formation. - Document pilot scale High Explosive disposal operations (biotreatment at Pantex, molten salt at LLNL). - Characterize the performance and sensitivity of aging explosives as part of continued surveillance of the enduring stockpile. - Support maintenance of technologies to clean up tritium-contaminated articles and to recover tritium. - Start decontamination of glove boxes at Tritium Salt Fabrication Facility.	- Continue to develop key advanced materials and/or manufacturing processes to enable use of new materials/processes to improve stockpile safety and reliability and reduce cost/cycle time. - Continue the development of non-invasive assay techniques for plutonium and uranium in storage and support design concepts to reduce worker exposure during storage operations. - Develop advanced optical firing technology prototype hardware support in support of enhanced safety. - Operate the Weapons Experimental Tritium Facility to meet programmatic needs and compliance with regulations and orders.

FUNDING LEVELS:

$58,631	$56,122	$54,680

CHEMISTRY AND MATERIALS: Research in materials synthesis and processing, determination of materials structure and composition, and development of functional properties in polymers, metals, ceramics, inorganic and organic materials, and composites. The specialized materials developed and used in nuclear weapons and their reliability requirements have created a unique set of materials science challenges. These activities are required to address the resolution of weapons aging and reliability issues, to support the remanufacture of stockpile components in a timely, cost effective, and environmentally benign way, and to enhance the reliability and surety of remanufactured components. Pertinent objectives include maintenance of engineering competence in this unique set of materials science, development of models to study aging phenomena, and development of low toxicity alternative materials to reduce environmental, safety and health concerns associated with weapons production, maintenance, and dismantlement.

MEASURABLE PERFORMANCE ACTIVITIES (Chemistry and Materials Science & Technology-Chemistry and Materials Details):

FY 1995:	FY 1996:	FY 1997:
- Accomplished Microalloying of uranium to control dynamic properties. - Technology was developed for slip-casting a toughened ceramic fit with very small pore size for control applications. - Established new selective sintering process device for rapid prototyping of plastic parts. - Initiate experiment to measure permeability of vadose zone gases in LYNER through the Joint Test Organization to look at transport pathways of interest to containment and to groundwater recharge. - Established that a cesium overlayer on diamond surfaces can lead to negative electron affinity and reaction with fluorine can stabilize the surface with respect to oxygen exposure; this result creates the potential for using diamond in electron emission devices.	- Develop techniques for depositing protective polymeric films on weapons components. - Continue research of interface science: modify the ductile rupture mechanism in Al/sapphire bonds by controlling void nucleation and growth kinetics, and develop multiscale materials models for the deformation of bcc and fcc metals. - Synthesize polymer-based materials with specific molecular receptor sites for selected types of metal ions. Show use of these materials as surface coatings for advanced chemical sensors, allowing the production of new generation sensor devices with improvements in sensitivity and selectivity. - SmartCeramics Project will continue the development of a 3D model for ceramic compaction to be used to improve the homogeneity of ceramic compacts and reduce defect formation.	- Develop the capability to accurately predict materials age related reliability problems in the stockpile. - Develop the knowledge and demonstrate the ability to synthesize and process materials with properties meeting design performance specifications with no adverse environmental impact and compatible with rapid prototyping and agile manufacturing. - Determine material properties and the range of values required to meet key performance requirements in weapons components and subsystems sufficiently to certify replacement materials. - Develop key advanced materials and/or manufacturing processes to enable use of new materials/processes to improve stockpile safety and reliability and reduce cost/cycle time.

FUNDING LEVELS:

$15,880	$15,175	$14,915

HIGH EXPLOSIVES: Activities involve fundamental physics and chemistry of explosive materials; characterization and modeling of explosive properties; improvement of firing technology; investigation of demilitarization technologies; and engineering of explosive component prototypes and their evaluation for weapons use. Achieving an optimal balance between safety and performance is the major goal of these activities which seek to provide more powerful insensitive high explosives (HE); highly resistant to unintentional detonation; detonation systems that offer improvements in safety; and answers to questions about the effects of aging on high explosives in stockpiled weapons.

MEASURABLE PERFORMANCE ACTIVITIES (Chemistry and Materials Science & Technology High Explosives Detail):

FY 1995:	FY 1996:	FY 1997:
- Continued development of equation of state (EOS) models describing detonation and reactive flow for the thermochemical code CHEETAH. - Continued study of coupled thermal-chemical-mechanical code LYNX2D to insert into ALE3D code to establish a thermal-chemical-mechanical-hydrodynamic capability. - Progressed in determining ignition and combustion properties of HMX-based explosives at elevated temperatures and pressures, and in evaluation of response of TATB-based explosives to abnormal mechanical stimuli. - Fired first Bigplate with point-detonated LX-14 pushing a copper plate with five velocimetry laser beams as diagnostics. - Obtained isothermal simultaneous themogravitmetry modulated beam mass spectrometry measurements on the decomposition of HMX in three salt mixtures and over range of temperatures.	- Document pilot scale HE disposal operations (biotreatment at Pantex, molten salt at LLNL). - Characterize properties of HMX- and TATB-based explosives: ignition, deflagration, and detonation mechanisms, thermal properties at elevated pressure, and response to mechanical stimuli for HMX and TATB-based explosives. - Develop enhanced safety optical firing through prototype hardware development. - Characterize decomposition kinetics at elevated temperatures and pressures for improved thermochemical codes. - Characterize the performance and sensitivity of aging explosives as part of continued surveillance of the enduring stockpile. - Validate PRET Table with cylinder and spherical shots. - Begin combination of CHEETAH with the new 1D hydrocode to make the first New Generation test hydrocode.	- Conduct assessment of HE (plasticizer/ binders, HE/IHE properties) from dismantled weapons in support of stockpile surveillance. - Develop advanced optical firing technology prototype hardware support in support of enhanced safety. - Conduct small-scale and large-scale experiments to isolate thermal, chemical, and mechanical responses; provide scaling data in support of computational model development. - Extend understanding of aging effects (initiation thresholds, thermal and mechanical effects on containment), begin characterization for predictive models. - Conduct system tests using damaged HE.

FUNDING LEVELS:

$6,240	$6,336	$6,265

SPECIAL NUCLEAR MATERIALS: Advanced and automated plutonium processing, casting, dynamic plutonium testing, and machining technologies. This research supports an enhanced understanding of the physical, mechanical, chemical and thermodynamic properties of the actinides. Understanding actinide properties is fundamental to the development of environmentally benign fabrication, disassembly, handling, and storage capabilities. Continued development of these process technologies will improve weapon safety, facilitate monitoring as the stockpile ages, and reduce both waste generation and worker exposure.

MEASURABLE PERFORMANCE ACTIVITIES (Chemistry and Materials Science & Technology-Special Nuclear Materials):

FY 1995:	FY 1996:	FY 1997:
- Utilized critical assemblies to qualify and calibrate alarms for material handling problems, to calibrate dosimetry, and to improve safeguards assay techniques. - Maintained the capability to perform experiments for determination of the state and material response of plutonium. - Developed methods for characterization of pits in the continuing stockpile and improved ability to project future changes in material properties. - Developed non-invasive assay techniques for plutonium and uranium in storage and supported design concepts to reduce worker exposure during storage operations. - Performed experiments at the Los Alamos Critical Experiments Facility.	- Maintain the capability to perform experiments for determination of the state and material response of plutonium. - Develop methods for characterization of pits in the continuing stockpile and improve ability to project future changes in material properties, especially plutonium. - Develop non-invasive assay techniques for plutonium and uranium in storage and support design concepts to reduce worker exposure during storage operations. - Initiate preliminary design for phase II of the CMR building improvement project. - Perform experiments at the Los Alamos Critical Experiments Facility.	- Continue operational support of the project to improve the Chemistry and Metallurgy Research Building. - Maintain the capability to perform experiments for determination of material response of plutonium, including equation of state type experiments. - Develop methods for characterization of pits in the continuing stockpile and continue to improve ability to project future changes in material properties, especially plutonium, as the stockpile ages. - Continue the development of non-invasive assay techniques for plutonium and uranium in storage and support design concepts to reduce worker exposure during storage operations. - Perform experiments at the Los Alamos Critical Assembly Facility.

FUNDING LEVELS:

$27,511	$28,361	$27,380

TRITIUM: Material science research relevant to the production, disassembly, handling, and use of tritium and its compatibility with other materials and components. There are currently four broad areas of study in tritium research: gas transfer systems, solid storage systems, neutron generator tubes, and inertial fusion targets. Tritium is an essential material in nuclear weapons and a proposed fuel for inertial fusion targets. The design, production, and fielding of gas transfer systems involve issues in material characterization, performance modeling, and aging phenomena.

MEASURABLE PERFORMANCE ACTIVITIES (Chemistry and Materials Science & Technology Tritium Detail):

FY 1995:	FY 1996:	FY 1997:
- Consolidated tritium inventories by moving SNL Tritium Research Lab's tritium function stations to LANL's Weapons Experimental Tritium Facility (WETF)	- Operate the Weapons Experimental Tritium Facility to meet programmatic needs and compliance with regulations and orders	- Perform experiments at LANL's Weapons Experimental Tritium Facility to meet Stockpile Stewardship programmatic needs.
- Successfully operated new tritium gathering system to clean up tritium contamination that avoids creation of tritiated water	- Support maintenance of technologies to clean up tritium-contaminated articles and recover tritium in the most efficient methods possible	- Support maintenance of technologies to clean up tritium-contaminated articles and recover tritium in the most efficient methods possible.
- An Acorn boost system loading manifold has been designed and constructed at the WETF	- Start decontamination of glove boxes at Tritium Salt Fabrication Facility	

FUNDING LEVELS:

$9,000	$6,250	$6,120

CORE STOCKPILE STEWARDSHIP

TESTING CAPABILITIES AND READINESS: The original and still primary purpose of the Nevada Test Site is to provide a continental site for nuclear weapons testing. Current Presidential direction is to maintain a readiness capability to conduct an underground nuclear test at the NTS. Infrastructure appropriate to this requirement is to be maintained as well as those measures necessary to assure continued environmental, health related, public safety, and physical protection. Presidential direction also indicates that resources should be included that are necessary to conduct experimental activities planned by the nuclear weapon design laboratories and appropriate to the national nuclear test policy, such as stockpile stewardship high explosive driven experiments. Annual maintenance of readiness activities include maintenance of physical infrastructure including buildings and structures, electrical power transmission and distribution power lines, roadways, environmental and security activities, water wells and associated supply and distribution lines, and electronic communications systems including computers, alarms, and telephone system; and general site security including onsite law enforcement, intruder prevention and interception, and real property protection. Capital equipment and general plant projects funding necessary to support this activity are included in this category.

PROGRAM GOALS:

- Maintain the infrastructure of the Nevada Test Site to allow its use by various Department of Energy programs,
- Maintain the skills, technologies, and environment, safety and health certifications necessary to allow a resumption of underground nuclear testing, per Presidential direction,
- Support the conduct of experiments at the Nevada Test Site which provide benefit to the ongoing laboratory stockpile stewardship programs while helping to maintain the NTS readiness posture

CHANGE FROM FY 1996:

Funding decrease from FY 1996 to FY 1997 reflects ongoing efforts to identify operational savings at NTS. Savings from contractor consolidation in FY 1995/96 are reflected in the requested funding levels.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Completed Lyner. Designed a 3rd Lyner experiment for FY 1996. Conducted Kismet, a containment characterization experiment, and Kuchen, a nuclear test readiness experiment/exercise. - Conducted two offsite field exercises as readiness training. -Defined and planned a hydrodynamic stockpile assessment experiment to be conducted in FY 1996	- Four high explosive experiments with special nuclear material are planned to be supported by DOE/NV and the integrated contractor to prove capability to conduct a nuclear test and provide needed stockpile stewardship data. - All archived data and procedures will be reviewed. Equipment not in use will be mothballed and stored. Survey instruments will continue to be calibrated and maintained in a state of readiness.	- Experiments to demonstrate and exercise capability will continue. - Identify and record skills and knowledge necessary to maintain capability to resume testing. - This category provides funding for the Nevada Test Site contractors to support laboratory experimental activities at the Nevada Test Site. Laboratory activities are funded within other Stockpile Stewardship categories.

FUNDING LEVELS:

$180,687	$167,444	$162,525

LABORATORY CAPITAL EQUIPMENT is required by the three national laboratories to maintain the capabilities necessary for stockpile maintenance, safety activities, and laboratory site infrastructure. Funding in this category supports multiple laboratory programs or is of a basic infrastructure nature and therefore cannot be allocated to other Stewardship operations and maintenance categories.

FUNDING LEVELS:

$51,820	$58,555	$57,250

GENERAL PLANT PROJECTS are low cost construction projects (less than $2 million) required to maintain the infrastructure and ongoing Stockpile Stewardship programs of the three laboratories. Funding for Nevada Test Site general plant projects is included in the Testing Capabilities and Readiness category. Although funded as an operations and maintenance expense, these projects are generally not appropriately allocated to specific program mission lines.

FUNDING LEVELS:

$4,500	$7,500	$7,320

CONSTRUCTION LINE ITEMS: There are two new infrastructure revitalization subprojects included in the FY 1997 request, both within 96-D-102, Stockpile Stewardship Facilities Revitalization, Phase VI. **Real Property Protection, Phase I,** (TEC $7.8 million), is the first in a series of projects to repair and replace roofs at Lawrence Livermore National Laboratory. The **138 kV Substation Modernization** (TEC $28.149 million) is currently scoped to upgrade the current electrical circuit at the Nevada Test Site. The first year funding will be used to provide engineering design to ensure the final scope of the project is consistent with ongoing NTS missions including readiness to resume underground testing. It is anticipated that the completion of the engineering and the scope review will allow actual construction of significant portions of the project to be put off indefinitely pending actual direction to resume testing.

Starting in FY 1997 the **Dual-Axis Radiographic Hydrotest Facility** at Los Alamos National Laboratory has been removed as a subproject within project 88-D-106, Nuclear Weapons Research, Development & Testing Facilities Revitalization, Phase II. The new stand alone line item, 97-D-102, will contain the entire scope of the project as outlined in the record of decision to the environmental impact statement (EIS) completed in FY 1995. In addition to the project scope previously included in 88-D-106, the new line item will also include the second radiographic arm of the facility and phased environmental containment of the firing site. However, due to the ongoing injunction against continuing construction efforts pending judicial review of the EIS, no new funds are requested in FY 1997. Any allowable activities will use funds previously appropriated for the project. Additional information can be found in the construction project data sheet.

Detailed information on construction line items can be found in the Construction Data Sheets following the budget narrative.

FUNDING LEVELS:

WEAPONS ACTIVITIES
(Tabular dollars in thousands. Narrative material in whole dollars.)

Weapons Stockpile Stewardship

1. Title and Location of Project:	Dual-Axis Radiographic Hydrodynamic Facility (DARHT) Los Alamos National Laboratory, Los Alamos, New Mexico	2a. Project No. 97-D-102 2b. Construction Funded

SIGNIFICANT CHANGES

- On January 26, 1995, an injunction was issued by the U.S. District Court, Albuquerque, New Mexico. All project activities were ceased.
- An Environmental Impact Statement (EIS) and Record of Decision (ROD) (October 1995) were issued in response to the injunction.
- The project scope has been redefined to include the preferred option of the EIS. As a result, the total estimated cost (TEC) increased from $81,400,000 to $105,700,000 and the total project cost (TPC) increased from $85,600,000 to $114,760,000. Project scope increases are:
  - Phased Containment
  - Increase in accelerator energy and X-ray dose production
  - Improved diagnostics
- This project was formerly a subproject of line item 88-D-106. The scope of the 88-D-106 plus the revisions identified in the EIS and ROD are combined into this new project to provide clearer visibility.

1999	0	0	0	5,000

This data sheet details project scope changes resulting from implementation of the project's Environmental Impact Statement, Record of Decision (EIS/ROD). However, no new funding is requested for this project in FY 1997. Prior year funds previously appropriated to this project (then a subproject within 88-D-106) and being held in a Headquarters reserve account pending completion of the judicial review of the projects ROD and EIS, is sufficient to support FY 1997 construction activity.

a/ Cost estimates include work scope for DARHT subproject 88-D-106 plus increased scope of first phase of firing site containment and enhancements to first accelerator arm capabilities and diagnostics.

b/ Funds appropriated in 1988-1996 are from the DARHT subproject 88-D-106 and are being moved to 97-D-102 to support management and monitoring of the project.

c/ Reflects the sequestration of funds for FY 1990 and the FY 1990 Omnibus reprogramming approved by appropriation subcommittees.

d/ Reflects the FY 1991 Omnibus reprogramming approved by Congressional subcommittees.

e/ $3,500,000 redirected from prior year appropriation from Dormitories subproject of line item 88-D-106 at the Nevada Test Site (NTS).

1. Title and Location of Project: Dual-Axis Radiographic Hydrodynamic Facility (DARHT) Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-102 2b. Construction Funded

8. Project Description, Justification, and Scope

The Dual-Axis Radiographic Hydrotest Facility (DARHT) project was previously submitted to Congress as a subproject of the Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase II project (88-D-106). With the virtual completion of the remaining ten subprojects in 88-D-106, the DARHT effort is being submitted as a stand-alone project so that it can be more readily managed, monitored and funded.

The Financial Schedule includes the federal funds required for the first phase of the project to implement the Department's Record of Decision (ROD) released in October 1995 at the conclusion of the facility's Environmental Impact Study process. (Description of project phases begins on following page). Completion of the first phase of the project will provide an initial operating capability; however, DOE intends to eventually operate DARHT in a dual axis mode. Additional outyear funding will be requested upon determination of the cost optimum funding profile for Phases 2 and 3. This budget submission reflects the project required to begin implementation of the Department's decision with respect to DARHT, but expenditure of any funds, including prior year appropriations, will not begin until the federal court injunction against the project is dissolved as a result of the judicial review of the EIS and ROD that is now underway. Once the injunction is dissolved, it is estimated that prior year funding will be adequate to carry the project through FY 1997, therefore, no funding is being requested for FY 1997.

Project History Leading to Current Project Scope

Originally the project included two 16-MeV electron-beam accelerators producing x-rays. In FY 1990, the Department decided to defer construction of the Hydrotest Firing Site pending completion of technology development verified by the test results from an Integrated Test Stand. The Integrated Test Stand consists of about 30 percent of one x-ray machine per the current LANL design (no funds were requested in FY 1992 and FY 1993). Following the successful ITS test results, development and construction of the hydrotest firing site was re-scoped based on the recommendations of two independent "Blue Ribbon" review committees assembled to assist the Department of Energy (DOE) in enhancing the development of a vital hydrotest capability. The new scope provided for the development, procurement, and installation of the first of two 16-MeV flash x-ray machines (for dual-axis radiography) at the firing site; and construction of a weatherproof building to house the dual-axis radiographic systems and supporting calibration activities. Construction was resumed in FY 1994.

On January 26, 1995, an injunction was issued for this project by the United States District Court for the District of New Mexico, requiring a cessation of all actions associated with the DARHT construction project, including any construction, procurement, design, or any furtherance of the DARHT project pending completion and judicial review of an EIS and ROD. In response, the Department ceased all project activities and has completed an EIS for this project. A ROD was published in October 1995. The preferred option selected is to complete the project and operate the DARHT facility with the use of steel containment vessels. This containment option includes multiple phases to eventually obtain at least 75 percent reduction in the emissions from high-explosives testing when compared to the DARHT Baseline Alternative analyzed in the EIS.

The DARHT project is hereby redefined to comply with the Record of Decision (ROD) preferred alternative subdivided into three phases. The first phase, most of which has been in progress since FY 1988, consists of the construction of a Radiographic Support Laboratory (RSL) and a Hydrotest Firing Site (HFS), to include the first of two flash x-ray machines. Also included in this phase is the initial stage of containment of emissions from the high-explosives experiments to be conducted at the facility, accelerator energy is increased from 16 to 20 MeV, accelerator changes to generate higher electron-beam currents, and improved diagnostics are included. The second phase will include the second flash x-ray machine as well as the second stage of increased containment of testing emissions. The third phase consists of the third and final stage of increased containment of testing emissions. Each of the three phases of the DARHT project are described in greater detail below.

8. Project Description, Justification, and Scope (Continued)

Phase 1

Phase 1 scope includes the building housing the two firing arms and laboratories, the first of the two firing arms, and the first phase of firing site containment.

Radiographic Support Laboratory (RSL)

The RLS has been completed, is now fully operational and is fulfilling its intended role in the development of the flash x-ray machines to be installed at the hydrotest firing site.

The RSL provides an appropriate building for the development, calibration, and maintenance of high energy hydrotest x-ray machines. This laboratory contains a radiographic machine room and adjacent control room, a laser assembly room, and a staff shop. Additionally, this facility includes space for a machine shop, offices, inspection room, and required toilets. A mezzanine containing approximately 5,385 square feet is also included. The building contains approximately 20,750 square feet.

The building has a structural steel space frame, bar joists, and a standing seam metal roof. The exterior walls of the building are clad with insulated metal panels. Interior walls and partitions include concrete masonry units and metal studs with gypsum board.

The radiographic machine room includes support equipment for x-ray machine development and calibration. A 10-ton capacity bridge crane is provided in the machine room and the machine shop includes a 5-ton capacity bridge crane. In order to protect operating personnel from radiation produced in the radiographic machine room, a full-height shield wall of reinforced concrete is provided.

Fire protection is provided throughout by a hydraulically designed automatic sprinkler system. Plumbing and process piping includes hot and chilled circulating air, potable hot and cold water, industrial cold water, sanitary sewer, compressed air, natural gas, sulfur-hexaflouride gas, transformer oil, and low-conductivity water systems. An air-cooled cold water generator provides chilled water for cooling; hot water is provided by a boiler. These are used to heat and cool the building. Two above-ground, 10,000 gallon, oil storage tanks are located outside but adjacent to the pit in the machine room.

The utility work for the building includes extension of electricity, water, and gas; removal and relocation of sewage system; and extension of communications. Standard equipment will include office furniture, shop equipment and tools, and two bridge cranes.

The indoor facility allows generator optimization studies, the purpose of which are to improve the generator x-ray quality. In addition, new pulsed-power measuring and calibrating test stands included in this facility allow pulsed-power system components to be studied individually. The radiographic systems facility is used to test new concept prototypes. The new facility improves the repair speed, reliability, and future quality of the flash x-ray generators used to diagnose weapons hydrotests. This increases the utility and effectiveness of hydrotest measurements.

In addition to the pulsed-power area, this building includes space for a mechanical fabrication branch machine shop, which will consolidate the branch shop in one area.

1. Title and Location of Project: Dual-Axis Radiographic Hydrodynamic Facility (DARHT) Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-102 2b. Construction Funded

8. Project Description, Justification, and Scope (Continued)

Hydrotest Firing Site

Phase 1 provides for the development, procurement, and installation of the first of two flash x-ray machines (for dual-axis radiography) at the firing site; procurement and installation of state-of-the-art hydrodiagnostic instrumentation at the firing site; construction of a blastproof building to house the dual-axis radiographic systems and supporting calibration activities.

The complete Hydrotest Firing Site building will be constructed as part of this phase, as will the first x-ray machine and all electronic and optical diagnostics. The second machine, necessary to complete the essential dual-axis configuration of the facility, will be built in a sequential manner (Phase 2), allowing it to take advantage of engineering and scientific advances that may occur before its construction. The first machine will be a state-of-the-art linear induction accelerator, producing an electron beam of approximately 20-MeV that will be converted into an x-ray beam. In addition to the increase in beam energy from 16 MeV to 20 MeV, the use of a photocathode and higher current beam magnets will be added to significantly improve the radiographic performance. A high speed electronic data acquisition system, a firing site control system, and optical imaging systems will also be included. Optical instrumentation will include high-speed framing and streak cameras and laser velocity interferometers. To improve the diagnostics capability of this facility, a gamma-ray camera will be included.

A two-level, 38,200-square-foot building to house and operate both accelerators will be constructed. The walls and roof will be designed to shield personnel operating the facility from the radiation produced by the accelerators, as well as to resist blast forces resulting from the detonation of explosives. The accelerators will be located on a three foot thick concrete slab on grade. Each accelerator room will contain approximately 11,875 square feet and will be equipped with a 10-ton capacity bridge crane. Completion of the complete building for both x-ray machines allows installation of the second machine (Phase 2) to take place without stopping hydrodynamic testing activities that would begin upon installation of the first machine.

The power supply rooms will provide space adjacent to the accelerators for electrical equipment that serves the accelerators. These rooms will be equipped with three ton capacity bridge cranes. The detection chamber will be electromagnetically shielded. Adjacent to the detection chamber will be the control room, a cable room, a capacitor discharge unit (CDU) room, and a computer room. The detection chamber, computer room and accelerator control room will also be provided with an access flooring system. Other rooms will include an optical room, an analyzer room, a Fabry Perot room, a laser illumination room, an assembly room, toilets, and mechanical/electrical equipment room. This area will contain approximately 26,325 square feet.

Fire protection will be provided throughout by a hydraulically designed foam/water automatic sprinkler system. Plumbing and process piping will include hot and chilled circulating water, potable hot and cold water, industrial cool water, sanitary sewer, compressed air, natural gas, transformer oil, and low-conductivity water systems. A boiler and two chillers will be included to provide hot and cold water. This conditioned water will be used for heating, ventilating, and air-conditioning the building, with the exception of the detection chamber and accelerator control room, which will be serviced with "computer-type" units. Two above-ground, 12,000 gallon oil storage tanks, a cooling tower, and an electrical substation will be required. Power will be supplied to the building from an existing 13.2 Kv line. The building will be equipped with communication systems that will include telephone, intercom, and broad band communications.

Site work will include a new asphalt surfaced access road, an asphalt surfaced circulation road and parking area, surface drainage, and erosion control. Utilities to be extended to the site will include natural gas, water, electrical power, and communication services. A septic tank and seepage pit will be provided to handle the sanitary sewage. Standard equipment will include office furnishings and work benches and storage shelving.

1. Title and Location of Project: Dual-Axis Radiographic Hydrodynamic Facility (DARHT) Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-102 2b. Construction Funded

8. Project Description, Justification, and Scope (Continued)

For Phase 1 a prototype vessel system and a portable cleanout unit will be fabricated to obtain the initial 5 percent reduction in testing emissions when compared to the DARHT Baseline Alternative analyzed in the EIS for the first five-year period of facility operation. The prototype vessel system includes several large, steel vessels that would be assembled to realize a containment structure inside of which some of the high-explosives experiments would be conducted. Also included is the necessary equipment to handle and transport the vessel system.

Phase 2

Included in DARHT Phase 2 will be the second electron beam accelerator to be installed in the second accelerator hall provided in Phase 1. The second machine, necessary to complete the essential dual-axis configuration of the facility, will be built in a sequential manner, allowing it to take advantage of engineering and scientific advances that may occur before its construction. The second machine may be a more advanced accelerator or incorporate another advanced technology that offers significant cost, schedule, or performance advantages. Completion of the high-explosives containment strategy would also be provided as part of this phase.

Based on the experience gained during Phase 1 containment efforts, a permanent vessel cleanout facility will be constructed and put into operation. Five vessels and additional vessel segments will be fabricated as justified by operational experience. A reduction in testing emissions of at least 40 percent when compared to the DARHT Baseline Alternative analyzed in the EIS would be realized during the second five-year period of facility operation. Containment goals would be met or exceeded through the use of a combination of techniques: containment, material replacement, post-shot recovery, and program management.

Phase 3

Experience gained during Phase 1 and 2 will allow the final containment techniques to be implemented that would result in at least 75 percent reduction in testing emissions when compared to the DARHT Baseline Alternative analyzed in the EIS for the remaining years of facility operation. The Department of Energy (DOE) will meet the release reduction goals of this phase through the use of the combination of techniques discussed above. The decision to possibly further reduce testing emissions by developing a vessel system capable of containing a 440-lb (200-kg) charge will be made during this phase. No additional funding would be required for Phase 3 unless a decision to develop the 440-lb (200-kg) vessel is made.

Since its inception in 1988, the DARHT project has been recognized as a key link in DOE efforts to maintain the quality and reliability of the nuclear weapons stockpile. Historically, radiographic hydrodynamic tests and dynamic experiments have been a requirement to support the DOE (and predecessor agencies) mission; they remain for future efforts such as the Stockpile Stewardship and Management (SS&M) Program and assist in the understanding and evaluation of nuclear weapon performance. Dynamic experiments are used to gain information on the physical properties and dynamic behavior of materials used in nuclear weapons, including changes due to aging. Hydrodynamic tests are used to obtain diagnostic information on the behavior of a nuclear weapons primary (using simulated materials for the fissile materials in an actual weapon) and to evaluate the effects of aging on the nuclear weapons remaining in the greatly reduced stockpile. The information that comes from these types of tests and experiments cannot be obtained in any other way.

The DOE existing capability to obtain diagnostic information was designed and implemented at a time when the organization could rely on direct observations of the results of underground nuclear tests to provide definitive answers to questions regarding nuclear weapons performance. Without the ability to verify weapons performance through nuclear tests, some remaining diagnostic tools are inadequate by themselves to provide

1. Title and Location of Project: Dual-Axis Radiographic Hydrodynamic Facility (DARHT) Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-102 2b. Construction Funded

8. Project Description, Justification, and Scope (Continued)

sufficient information. Accordingly, as the Nation moves away from nuclear testing, DOE must enhance its capability to use other tools to predict weapons safety, performance, and reliability. In particular, DOE must enhance its capability to perform hydrodynamic experiments to assess the condition and behavior of nuclear weapons primaries.

Although the current U.S. stockpile is considered to be safe and reliable, the existing weapons are aging beyond their initial design lifetimes and, by the turn of the century, the average age of the stockpile will be older than at any time in the past. To ensure continued confidence in the safety and reliability of the U.S. nuclear weapons stockpile, DOE needs to improve its radiographic hydrodynamic testing capability as soon as possible. Uncertainty in the behavior of the aging weapons in the enduring stockpile will continue to increase with the passage of time because existing testing techniques, by themselves, are not adequate to assess the safety, performance, and reliability of the weapons primaries. Should DOE need to repair or replace any age-affected components, retrofit existing weapons, or apply new technologies to existing weapons, existing techniques are not adequate to assure weapons safety and reliability. In an era without nuclear testing DOE believes that it is probable that the existing weapons will require these types of repairs or retrofits in the foreseeable future. DOE has determined that no other currently available advanced techniques exist that could provide a level of information regarding nuclear weapons primaries comparable to that which could be obtained from enhanced radiographic hydrodynamic testing.

In addition to weapons work, DOE uses its radiographic testing facilities to support many other science missions, and needs to maintain or improve its radiographic testing capability for this purpose. Hydrodynamic tests and dynamic experiments are important tools for evaluating conventional munitions; for studying hydrodynamics, materials physics, and high-speed impact phenomena, and for assessing and developing techniques for disabling weapons produced by outside interests.

Without providing "facilities" such as the DARHT hydrotest firing site, the U.S. risks losing its superiority in nuclear weapons technologies and safety.

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 25,259
(1) Engineering design and inspection at approximately 27.9 percent of construction costs, (Design, Drawings, and Specifications)	$ 20,508	
(2) Construction management costs	0	
(3) Project management at 6.5 percent of construction costs (Item c).	4,751	
b. Land and land rights		0
c. Construction costs		73,434
1. Improvements to land	0	
2. Buildings	19,304	
3. Special equipment	54,130	
4. Utilities	0	
5. Demolition	0	
d. Standard equipment		113
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance f/		0
h. Subtotal (a through g)		$ 98,806
i. Contingencies at approximately 7.0 percent of above costs		6,894
j. Total line item cost (Section 11.a.1.(a))		$105,700
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$105,700

10. Method of Performance

Design and procurement of the conventional facilities will be performed under negotiated architect-engineer contracts. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

f/ Included with ED&I (a(1)).

1. Title and Location of Project: Dual-Axis Radiographic Hydrodynamic Facility (DARHT) Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-102 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item -- Construction line item costs for the engineering design, procurement, demolition, and construction are estimated to be $105,700 for Phase 1 only.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- This equipment is necessary to conduct the research and development (R&D).
   (d) Inventories -- None.

2. Other project costs
   (a) R&D necessary to complete construction -- Funded R&D costs are necessary to complete the equipment and vessel design.
   (b) Conceptual design -- Approximately $200,000 was incurred to establish the specific design and construction features for Phase 1 only.
   (c) Decontamination and Decommissioning (R&D) -- There are no D&D costs associated with this project.
   (d) NEPA documentation costs -- This is the costs of the DOE contractors, including Los Alamos National Laboratory, to support or prepare the EIS.
   (e) Other project related funding -- This is the cost for facility start-up including the Readiness Assessment.

b. Total related funding requirements

1. Facility operating costs -- The associated overhead for facility operating costs are to be determined.
2. Facility maintenance and repair costs -- The annual costs for direct labor, materials and supplies, and associated overhead for maintenance and repair activity are to be determined.
3. Programmatic operating expenses directly related to the facility -- These costs are to be determined.
4. Capital equipment not related to construction but related to the programmatic effort of the facility -- None.
5. GPP or other construction related to the programmatic effort -- None.
6. Utility costs -- These costs are to be determined.
7. Other Costs -- None.

Weapons Stockpile Stewardship

1. Title and Location of Project: Nuclear Weapons Stockpile Stewardship
Facilities Revitalization, Phase VI, Various Locations

2a. Project No.: 96-D-102
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1996

3b. A-E Work (Titles I & II) Duration: 46 Months

4a. Date physical Construction Starts: 3rd Qtr. FY 1997

4b. Date Construction Ends: 1st Qtr. FY 2002

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $33,700
Total Project Cost (TPC) -- $34,660

6. Current Cost Estimate:
TEC -- $69,659
TPC -- $70,748

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1996	$ 2,520	$ 0	$ 2,520	$ 2,200
1997	19,250	0	19,250	13,100
1998	17,360	0	17,360	20,570
1999	13,680	0	13,680	13,940
2000	9,800	0	9,800	6,700
2001	7,049	0	7,049	13,149

8. Project Description, Justification and Scope

The TEC was increased from $33,700,000 to $69,659,000 and the TPC from $34,660,000 to $70,748,000 because two subprojects were added: 138kV Substation Modernization at NTS and the Roof Replacement -- Protection of Real Property at LLNL.

This series of projects provides for the construction of new facilities, and modifications, relocations, and additions to existing facilities for the Nuclear Weapons Stockpile Stewardship facilities at Sandia National Laboratories (SNL), Los Alamos National Laboratory (LANL), Lawrence Livermore National Laboratory (LLNL) and the Nevada Test Site (NTS). These projects are a multiyear capital investment program to provide new or additional capabilities or capacities to revitalize the Nuclear Weapons Stockpile Stewardship complex. These new and modified facilities will replace or add to existing facilities that are overaged, deteriorated, overcrowded, or are inadequate to preserve capabilities required for the current and future weapons stockpile stewardship program.

The Nuclear Weapons Stockpile Stewardship program is made up of a highly complex set of activities extremely dependent on current and advanced technology facilities and equipment to meet its varied needs. The successful performance of the Stockpile Stewardship program contributes directly to the quality and reliability of the nuclear weapons stockpile. In addition to unremitting requirements for reliability and performance, we are committed to pursue new safety and safeguards features for the enduring stockpile. These standards require innovative physics concepts and designs, the development of new materials and material applications, and extension of both engineering and manufacturing technologies beyond the current "state-of-the-art."

99

8. Project Description, Justification and Scope (Continued)

The revitalization effort was initiated in FY 1984 with Project 84-D-107, Nuclear Testing Facilities Revitalization, and was followed in FY 1985, FY 1988, FY 1990, FY 1992 and FY 1994 by follow-on phases. These projects were defined based on needs identified by representatives from the Albuquerque and Nevada Field Offices, and the three weapons laboratories. Since the initiation of these projects, all aspects of the laboratory complex capital asset base continued to be critically reviewed and have resulted in the initiation of this line item project which contains four subprojects.

The consolidation of the Nuclear Weapons Stockpile Stewardship revitalization needs into one project data sheet focuses the issue of the total needs of the Stockpile Stewardship program. With the decreased demand for new weapon systems, this project is oriented toward preserving the critically needed infrastructure at LANL, NTS, and LLNL.

FY 1997 funds will be used to start engineering and design of subprojects 03 and 04 and to begin construction of all subprojects 01, 02, and 04.

Details on FY 1996 and FY 1997 new start subprojects which require funding in FY 1997 and beyond are provided below.

a. Utilities/Infrastructure Support Facilities, Various Locations

These subprojects cover general purpose facilities at various DOE locations that are an integral part of the installation support infrastructure. Included are basic utility systems, such as electrical power distribution, sewage, roads, parking lots, gas distribution, water supply, and the like. Many of these systems were constructed during the 1940s to World War II specifications with a 10-year maximum life expectancy. Many of them are now deteriorated beyond economic repair and do not meet present-day standards for safety and environmental protection.

Subproject 01 - Water Well Replacement, LANL, Los Alamos, New Mexico

TEC	Previous	FY 1996	FY 1997	FY 1998	FY 1999	Outyear	Construction Start - Completion Dates
$16,800	$0	$1,000	$10,200	$4,500	$1,100	$0	3rd Qtr. FY 1997 - 4th Qtr. FY 1999

This project is to provide four new 800-GPM, moderate yield, low-drawdown, production wells to replace six existing marginal or nonproducing wells located in the Guaje Well Field. The major components of work for each well location will include the following items: drilling, casing, and development of an approximately 2,000-foot deep well; a new deep well pump at the developed head, a new well house with roof hatch access, lights, heat and ventilation; discharge piping with flow meter, check valve and manual block valves to connect to existing distribution system; electrical power from existing overhead system; control scheme compatible with existing system; security fencing around the well house and a section of access road connecting with the existing Guaje Road.

After the new wells are completed and on line, six existing wells will be taken out of service and the well, pump, pump house and all related site improvements will be removed and salvaged. All disturbed areas will be reseeded to match the natural surroundings.

This project is necessary to meet historical and fire protection water demand and to ensure a continuous and reliable water supply to the Laboratory. The majority of the Guaje wells were completed in 1950-1952 and do not meet the original capacity of 500 GPM due to pump deterioration, down-hole mineral deposits, and related well damage.

The Guaje Field is an integral part of a three-well field system that supplies potable and fire protection water to the Laboratory.

1. Title and Location of Project: Nuclear Weapons Stockpile Stewardship
Facilities Revitalization, Phase VI, Various Locations (Continued)

2a. Project No.: 96-D-102
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

If this project is not funded, the capacity of the water system will continue to decline, resulting in capacity levels below the demands of the system. During peak summer demand periods, severe water usage curtailment measures would need to be implemented to avoid reducing the fire protection storage below allowable levels.

Subproject 02 - Fire Protection Improvements, LANL, Los Alamos, New Mexico

TEC	Previous	FY 1996	FY 1997	FY 1998	FY 1999	Outyear	Construction Start - Completion Dates
$16,900	$0	$1,520	$5,050	$5,450	$4,880	$0	4th Qtr. FY 1997 - 4th Qtr. FY 1999

The purpose of this subproject is to provide improvements to water storage capabilities in selected Technical Areas, and associated distribution system piping to connect the new tanks to the existing system. An additional Technical Area will receive distribution lines from an existing water storage tank. Approximately 28 buildings will receive improvements to internal sprinkler and/or fire alarm systems. Approximately 144 buildings will receive lightning protection systems or additions to existing systems.

Included in this subproject is a 1,500,000 gallon ground storage tank, a 750,000 gallon storage tank, a 150,000 gallon storage tank, two 100,000 gallon storage tanks, 25,500 feet of related distribution line piping, and related pumps and tie-ins to existing components of the existing system.

This project provides upgrades of the water system serving LANL and upgrades or new sprinkler and/or fire alarm systems in existing buildings in order to meet "improved risk" criteria from DOE Orders 6430.1A and 5480.7. These two orders mandate compliance with National Standards and are a proactive posture for loss prevention depending on the contents of the facilities and their importance to program requirements.

The water and sprinkler system deficiencies were identified in the 1976 Factory Mutual Survey and cited again in the 1989 Factory Mutual Survey. In addition to the Factory Mutual Surveys, six major deficiencies were cited in the DOE-wide Tiger Team Audit of 1991.

The majority of the water supply system for LANL was installed in the 1950's. As additional requirements were placed upon the system due to increased program needs, the distribution lines have been extended. The water storage and supply have not been improved to meet the requirements.

The following is a new subproject that was not included in the FY 1996 Congressional data sheet.

Subproject 03 - 138kV Substation Modernization, NTS, Las Vegas, Nevada

TEC	Previous	FY 1996	FY 1997	FY 1998	FY 1999	Outyear	Construction Start - Completion Dates
$28,149	$0	$0	$1,000	$2,600	$7,700	$16,849	1st Qtr. FY 1999 - 1st Qtr. FY 2002

Presidential direction to the Department is to maintain an ability to return to underground nuclear testing at the Nevada Test Site within 2-3 years of direction to do so. The existing power supply system at the NTS, due to aging and loading requirements is at too high a risk of failing to support an ongoing test program. If it became necessary to replace the system, it could not be done within the 2-3 year readiness window. Our strategy to prepare for this contingency is to obtain congressional authorization and complete final design and scoping of the project. It is the intention of Defense Programs not to proceed with physical construction of the power system upgrades

101

8. Project Description, Justification and Scope (Continued)

until either the current system is no longer able to support current ongoing NTS missions or direction is given to the Department to begin preparing to resume underground nuclear testing.

The project scope described below is the maximum scope that may be required to meet the requirements of the NTS. If, and when, physical construction begins, actual scope of the project will be reviewed.

This subproject will replace one major substation, one switching center, and one switching station on the 138 kilovolt (kV) transmission system loop at the NTS. The switching center and switching station serve as termination points for the incoming power lines from outside utilities. Site improvements at each of the proposed facilities will include site and access road grading, conduit trenching, perimeter fencing, area lighting, and concrete foundations for power equipment installations.

The Frenchman Flat and Jackass Flats Substations and the Mercury Switching Center will each require a new control building. Concrete masonry units (CMUs) will be used for construction and their sizes will be 600, 800, and 800 square feet, respectfully. Each building will provide an adequate environment for electrical relays, switchgear, and telecommunications equipment. Each control building will contain a heating, ventilation, and air conditioning (HVAC) system; a fire-detection and alarm system; electrical power for interior and exit lighting; battery-powered emergency lighting; telephones; and fully insulated walls and ceilings.

The Mercury Switching Center is the termination point for the Nevada Power Company (NPC) 138kV transmission line, which provides the primary power source to the NTS. NPC metering is located at this facility. This switching center will be replaced by a new center located in close proximity, and existing incoming and outgoing 138kV transmission lines will be modified to terminate at the new center. The existing dispatch center will remain within the Mercury Switching Center; the installation of new relaying, metering, and telecommunication equipment within the control building will require that the dispatch center be expanded. The Mercury Switching Center will be constructed using a breaker and one-half configuration.

The Jackass Flats Substation is the termination point for the Valley Electric Association (VEA) 138kV line, which provides an alternate power source to the NTS. NPC metering is also located in this facility. This substation contains an autotransformer, which provides 138/69kV transformation and a 69kV buss with 69kV service to Area 25 at the NTS. The 138kV facilities will be replaced by a new switching center located next to the existing substation. The existing 69kV facilities and autotransformer will remain at the existing facility, which will be supplied by a tap from the new switching center. The existing incoming and outgoing 138kV lines will be modified to terminate the new switching station; however, the existing 69kV and 12kV facilities and lines will not be modified. The switching center will be constructed using a breaker and one-half configuration.

The Frenchman Flat Substation will be replaced with a new substation constructed near the existing facility. Existing 138kV and 34.5kV lines will be modified to terminate at a new 138kV/34.5kV transformer in the new substation. The substation will be constructed using a ring-buss configuration. The new substation, switching center, and switching station will employ rigid buss-type structures, new gas breaker technology, microprocessor relays, SCADA control of major equipment, and new fiber-optic cable for telecommunication requirements (relaying, metering, and telephone system). A fiber-optics system will replace the existing, unreliable powerline carrier communications system. This fiber-optics system will employ approximately 100 miles of fiber-optic cable wrapped around the existing overhead static wire on the NTS 138kV transmission line. All three facilities will have a grounding-grid system and a lighting-protection system. Power will be transferred to each facility upon completion of construction. All of the retired facilities will be demolished.

The 138kV transmission loop with its associated facilities is the backbone of the entire NTS power system. Reliable power for all weapons testing programs, the Yucca Mountain Project, environmental programs, and many other projects and programs conducted at the NTS are dependent upon the reliability of these facilities. Maintenance of aging and failing equipment is becoming increasingly more difficult

1. Title and Location of Project: Nuclear Weapons Stockpile Stewardship
Facilities Revitalization, Phase VI, Various Locations (Continued)

2a. Project No.: 96-D-102
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

because many replacement parts are no longer available. The Mercury Switching Center and the Jackass Flats Substation are the key substations at the NTS and connect to the outside utility companies, which provide electrical power to the site. Equipment failures in these facilities have a significant impact upon all NTS programs and the reliability of the entire power system.

Existing 138kV power facilities at the NTS are approximately 25 to 35 years old. The three substations or switching stations to be replaced in this subproject are among some of the oldest facilities at the NTS. Over the past several years increased outages due to equipment failure have demonstrated that these facilities have reached the end of their expected useful life span. Existing circuit switchers and oil-filled breakers are starting to fail and must also be replaced. The 138kV transmission line between the Frenchman Flat and Jackass Flats substations has been used as a backup line during outages or maintenance of the line between the Jackass Flats Substation and the Mercury Switching Center; however, this line is nonfunctional due to breaker failure at both ends of the line. Even if these three facilities are replaced by the year 2000, the existing equipment will be at almost 40 years old, which is well past its reliable uselife. The potential for problems will increase with each additional year of age; therefore it is imperative that modernization occur as soon as possible.

The existing communication system has also been in service long past its useful life span, is obsolete, and needs to be replaced with a system that provides adequate speed and capacity for modern relaying, SCADA, and metering facilities. The use of microprocessors in these new technologies makes them very susceptible to lighting and the system noise present on the existing phone line system. A new communications system using fiber-optics technology is the most practical solution to provide a long-term, reliable communication system for the NTS power system.

The following is a new subproject that was not included in the FY 1996 Congressional data sheet.

Subproject 04 - Roof Replacement - Protection of Real Property, LLNL, Livermore, California

TEC	Previous	FY 1996	FY 1997	FY 1998	FY 1999	Outyear	Construction Start - Completion Dates
$7,810	$0	$0	$3,000	$4,810	$0	$0	2nd Qtr. FY 1998 - 1st Qtr. FY 1999

This project is to reconstruct five of the most seriously deteriorated building roofs at LLNL. Many LLNL buildings were built in the 1960's and 1970's and their roofing systems have been in place far longer than their expected economic lives. These buildings have had many patches and repairs to solve leaks and deterioration of original roofing, now entire roof systems need to be reconstructed. The project addresses five buildings with the worst roof conditions. These buildings will require immediate attention within the next few years to maintain and protect the integrity of the facilities/and make sure that programmatic work can proceed without serious damage to the buildings and their contents. This line item is the first phase of a proposed four phase roof reconstruction effort.

For the Laboratory to perform the caliber and variety of scientific work found at LLNL, the support requirements are many. A well functioning, efficient, and modern infrastructure is crucial not only to the level of performance at the Laboratory, but also to the health and safety of all its staff and equipment inside the structure.

The roofs of over 100 buildings at LLNL have exceeded their life expectancy of 20 years. Many of these have deteriorated to a point where they require frequent repairs, and leaks jeopardize experiments, experimental data and equipment. The five roofs identified for inclusion in this project's scope of work have severe problems, including membrane failure and possible structural damage. The roofs for Buildings 131, 151, 253, 331 and 511 will be reconstructed. The need to replace the roofs is important to stop any serious damage to the main structure where the cost would be greater and programs would have to leave the building while work progressed. These five buildings identified are needed for weapons core competency.

8. Project Description, Justification and Scope (Continued)

In general, the deterioration of these roofing systems is such that repairs will neither stop the leakage nor be cost effective. Therefore, replacement of the roofing systems is the only viable solution.

9. Detail of Cost Estimate

This cost estimate is based upon completed individual conceptual design reports. Rates used for escalation were taken from applicable DOE Departmental Price Change Indices, applied to the mid-point of the construction schedule.

	Item Cost	Total Cost
a. Design and Management Costs		$10,498
1. Engineering, design and inspection at approximately 15.1 percent of construction	$ 7,152	
2. Construction management costs at approximately 2.5 percent of construction.	1,185	
3. Project management at 4.6 percent of construction costs	2,161	
b. Land and land rights		0
c. Construction costs		47,197
1. Improvements to land	0	
2. Buildings	11,856	
3. Other structures	2,330	
4. Utilities	4,541	
5. Special facilities	28,050	
6. Activation	140	
7. Security	280	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		440
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		58,135
i. Contingency at approximately 19.8 percent of above costs		11,524
j. Total line item cost (Section 11.a.1.(a))		$69,659
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$69,659

The estimates by location are as follows:

Sandia National Laboratories	$ 0
Lawrence Livermore National Laboratory, California	7,810
Los Alamos National Laboratory, New Mexico	33,700
Nevada Test Site, Nevada	28,149
Total	$ 69,659

104

1. Title and Location of Project: Nuclear Weapons Stockpile Stewardship Facilities Revitalization, Phase VI, Various Locations (Continued)

2a. Project No.: 96-D-102
2b. Construction Funded

10. Method of Performance

Design and procurement of the conventional facilities will be performed under negotiated architect-engineer contracts. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1997	FY 1998	FY 1999	Outyears	Total
a. Total project costs						
1. Total facility costs						
(a) Line item (Section 9.j.)	$ 2,200	$ 13,100	$ 20,570	$ 13,940	$ 19,849	$ 69,659

1999	6,400	0	6,400	6,400

8. Project Description, Justification and Scope

Above ground experiments (AGEX) that address secondary weapons physics require an energy-rich, high energy density environment. To simultaneously achieve the full spectrum of conditions present in a nuclear weapon, an underground test is required. In above-ground experiments in the laboratory, one can examine individual aspects of secondary weapons physics using three classes of facility: pulsed power for high energy; high energy lasers for high power; and ultra high-intensity lasers for extreme energy-density conditions. No single technology can access the full range of conditions to meet the needs of the weapons program for above-ground experiments.

This project provides enhanced Los Alamos National Laboratory (LANL) pulsed power experimental capability (technical stewardship of capability in era of test restraints) to support AGEX for stockpile stewardship. This project includes the design, procurement, assembly, and installation of the Atlas 20-25 Megampere, 36 Megajoule capacitor bank with associated controls and power supplies in Buildings 124, 125 and 294 at LANL Technical Area (TA) 35. The project will utilize the existing 1,430 MVA generator located in building 301 at LANL.

The scope of work includes:

- Design, procurement, assembly, and installation of the Atlas 20-25 Megampere, 36 Megajoule capacitor bank with associated controls and power supplies in Buildings 124, 125 and 294 at TA-35.

1. Title and Location of Project: Atlas Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 96-D-103 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

- Modification of approximately 6,700 square feet of Building 124 at TA-35 to support Special Facilities (SFE) installation and completion of operational upgrades to the facility.
- Utilization of existing 1,430 MVA generator in Building 301 at TA-35 for electrical power.
- Installation of a power storage equipment area of 2,600 square feet in Building 294 and upgrades to the control room are of 1,600 square feet in Building 125 at TA-35; also provides power distribution and diagnostic cabling to experiment in Building 124.
- Completion of site work and utilities to support the use of up to 3 Government-Furnished diagnostic trailers and installation of new dielectric oil storage tank adjacent to Building 124 at TA-35.

This project will support a weapons experimental program that is an alternative to the underground nuclear testing program. These experiments are an essential part of any nuclear weapons program. Because of the extreme conditions achieved in a thermonuclear explosive, no single technology can hope to simulate all weapons physics. One must make increasing sacrifices in experimental volume and duration to reach conditions nearer to those found in nuclear explosives. Existing facilities are unable to reach the required conditions. A cost/benefit analysis was performed to identify the breakpoints in technology required to provide credible above-ground simulation capabilities at minimum cost.

The use of the existing Los Alamos Antares facility with internal modifications of power, HVAC, and partition systems will permit a cost-effective, conveniently located facility to be added to the existing inventory of experimental facilities supporting AGEX II. The chosen site will permit sharing the existing 1,430 MVA generator in Building 301 at LANL.

A summary of key justification items for ATLAS follows:

- ATLAS addresses an essential capability requirement for DOE's stockpile stewardship.
- Without underground testing, AGEX are the best means available to exercise and validate design judgement.
- The United States entered the extended test moratorium in July 1993. AGEX must help mitigate the technical risks and the loss of stockpile-related judgement associated with a no-test environment by exercising weapons skills.

The FY 1997 funds will be used to complete the detailed design, initiate long-lead procurements, and begin building modifications.

8. Project Description, Justification and Scope

A slight increase in TPC, from $48,600,000 to $49,000,000, reflects experience obtained from a similar project nearing completion at SNLA.

The Processing and Environmental Technology Laboratory (PETL) is a new laboratory/office facility to be located on a presently vacant site. The proposed building is a three-story building with a full basement. Each floor is approximately 41,000 square feet, yielding a building of approximately 165,700 gross square feet. An exterior waste holding and neutralization area (approximately 1,730, gross square feet) and a chemical storage area (approximately 1,780 gross square feet) are also included. The Office/Laboratory consists of two primary functional areas, laboratory and office space. The offices are located at the eastern end of the facility, and the laboratory service areas and loading docks are located at the west end. The building is designed to meet the latest ES&H requirements for facilities of this type. Vibration isolation, pedestrian circulation, emergency egress, separation between laboratory and technician work stations, and separate laboratory service corridors which serve as secondary emergency exits are all design responses to identified user requirements. The building will have a modular design to facilitate varying the size of laboratory and office spaces in minimum time and at low costs, as user requirements change. The building is oriented on an east-west axis to achieve maximum opportunity for solar gain along the south elevations.

Utility chases will extend from the basement to the roof deck and will have walls of painted gypsum board over metal studs with a 2-hour fire rating. Generally, interior walls are gypsum board over metal studs. Elevator shafts will be of 8 inch concrete masonry construction. Fire-rated partitions around laboratory areas are of fully grouted 8 inch concrete masonry, continuous to the underside of the floor surface to

1. Title and Location of Project: Processing and Environmental Technology Laboratory, Sandia National Laboratories, Albuquerque, New Mexico (Continued)	2a. Project No. 96-D-104 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

achieve a 4-hour rating. Floors will be hardened exposed concrete in the basement, utility chases, stairwells, and undeveloped office/lab areas. The structural system will consist of a cast-in-place reinforced concrete frame supporting a cast-in-place reinforced waffle slab system at the elevated floors and precast concrete double tee units at the roof. The exterior wall system consists of cast-in-place walls, columns and spandrel beams with standard gray precast concrete window units set in place between the spandrel beams and columns. Air intake/supply shafts are enclosed with the precast concrete flat panels.

The heating, ventilating, and air conditioning systems include a double duct, variable air volume (VAV), perimeter heating/cooling system, and a core or interior single duct VAV system. Heating will be provided by piped hot water generated at a heat pump chiller. The chiller will provide cold water for building cooling and test equipment. Interior plumbing systems will include sanitary waste, domestic hot and cold water, compressed air, natural gas, and chilled water supply and return. Exhaust will be provided by utility fans located at the roof level, connected to exhaust duct risers in chases. Site utilities include a primary electric feeder, signal duct, steam and condensate lines, water, natural gas, and sanitary sewer. Area improvements will include security fencing, storm drains inlets, and service and driveway areas. Landscaping, including trees, shrubs, irrigation system and gravel, will be provided consistent with existing landscape practices. The building will be designed to conserve energy.

The PETL is an important element that will enable SNL to continue to provide exceptional research and development capability in support of the Department of Energy (DOE).

A publicly-stated objective of the DOE is to use an aggressive R&D program to develop production processes which will offer significant cost reductions and minimize the use of toxic materials. The synergism represented by PETL meets the DOE's objective in that it collocates individuals responsible for identifying and developing new materials and processes, and translating them to application.

The focus of PETL is the development, characterization, and application of modern processing to ensure the safety of the environment and personnel, as well as to produce products required for nuclear weapons applications. PETL allows the integration of real-time, on-line diagnostics, test structures in processing lines for "self-identification" of processing problems. The substitution of environmentally safer processing chemicals will be analyzed to minimize design impact and to assess the affect on long-term compatibility. Analytical support for production of non-nuclear components will replace services provided by integrated complex plants, as the manufacturing complex is reduced in size and Manufacturing Development Engineering (MDE) increases.

The primary mission of Sandia National Laboratory is the weaponization of nuclear explosives, i.e., the design of the non-nuclear components in nuclear weapons. The goal of the PETL is to maintain and to enhance SNL's capability to provide high-quality engineering research and development (R&D) to support the DOE weapons program to meet new environmental, safety, and health (ES&H) requirements and reconfiguration of the Nuclear Weapons Complex (NWC). PETL will provide R&D facilities for personnel responsible for developing materials and processes associated with weapon production. The materials and processes R&D has a strong waste minimization content and also meets performance, reliability, and cost requirements.

PETL occupants will include the following centers of excellence: the Materials and Process Sciences Center, the Engineered Materials and Processes Center, and parts of the Environment Center and the Microelectronics Center.

SNL is committed to supporting programmatic needs for materials, to resolving environmental problems associated with weapon production, and to conforming with environmental and safety regulations. This commitment is reflected in SNL's efforts to combine the above-mentioned centers of excellence, which are currently dispersed throughout the SNL site.

1. Title and Location of Project: Processing and Environmental Technology Laboratory, Sandia National Laboratories, Albuquerque, New Mexico	2a. Project No. 96-D-104 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

DOE is faced with developing a more efficient complex to produce and to dismantle weapons, as well as to address ES&H issues affecting SNL operations and nuclear weapon production. Without additional space, efforts involving materials compatibility, aging, and reliability will be severely limited. These efforts are essential in certifying the reliability of the nuclear weapons stockpile. Without new space, SNL would continue to occupy temporary buildings and substandard and leased space. Modifications of current laboratories are not feasible, because they would require complete replacement of basic services, such as heating, ventilating and cooling. For example, the main existing materials research laboratory has a ventilation system that spreads any gas or vapors throughout the building if a release occurs inside a fume hood.

PETL will provide facilities for staff seeking timely solutions to the following critical problems:

- Assuring safety and reliability of a smaller stockpile incorporating new materials and processes for production.
- Elimination of some materials from nuclear weapons because of production/usage restrictions, or total bans and increased requirements to minimize occupational exposure, with minimum effect on the reliability of nuclear weapons.
- Substitution of environmentally safer materials and processes during nuclear weapon production, with minimum effect on the reliability of nuclear weapons.
- Elimination/reduction of hazardous waste (radioactive, mixed, or chemically hazardous) during nuclear weapon production and better treatment (including detoxification or stabilization) of newly generated hazardous wastes.
- Dismantling nuclear weapons in an environmentally acceptable and safe manner.
- Compliance by SNL and the Nuclear Weapons Complex with ES&H laws, regulations, DOE orders, and industry standards.

Currently, materials activities are divided among nine different buildings. PETL will allow these activities to be centralized into one facility. Because most of the current laboratories are located in old facilities, the move to PETL will assist in conforming to current and expected regulations, DOE orders, and best industry ES&H practices.

PETL will enable the materials organizations to conform with best industry ES&H practices. The new building will be designed to conduct environmentally and occupationally safe R&D involving hazardous materials used in weapon production.

The planned use of the requested FY 1997 funding is for the continuation of Title I and II design and initiation of construction.

8. Project Description, Justification and Scope (Continued)

Removal Plan

The following buildings will be vacated by organizations proposing to move to the PETL:

Building	Year Acquired	Building Size (Net Square Feet)	Space Vacated (Net Square Feet)	Organization(s)
805	1959	48,471	23,748	1700/1800
806	1961	39,640	7,424	1700/1800
807	1966	52,845	2,317	1700/1800
823	1982	79,667	1,795	6600
828	1946	11,475	2,600	1800
894	1950	75,514	3,213	1800
T-47-49	1979	3,273	1,230	1800
			42,327	

Building 828 is considered substandard and included in the SNL substandard and temporary abandoned building decontamination and disposal program under a separate, future expense-funded project. It is expected the other space vacated by future PETL occupants will be backfilled by technical and administrative organizations as part of the Lab-wide space planning strategy.

1. Title and Location of Project: Processing and Environmental Technology Laboratory, Sandia National Laboratories, Albuquerque, New Mexico	2a. Project No. 96-D-104 2b. Construction Funded

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 6,031
(1) Engineering design and inspection at approximately 12.0 percent of construction costs, (Item C) (Design, Drawings, and Specifications $1,500)	$ 3,231	
(2) Construction Management (Item C)	862	
(3) Project Management at 7.2 percent of Construction Costs	1,938	
b. Land and land rights	0	
c. Construction costs		26,925
1. Improvements to land	323	
2. Buildings	24,771	
3. Other structures	0	
4. Utilities	1,831	
5. Special facilities	0	
d. Standard equipment		7,216
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		40,172
i. Contingencies at approximately 14.2 percent of above costs		5,728
j. Total line item cost (Section 11.a.1.(a))		$ 45,900
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 45,900

Note: This February 1994 estimate was prepared by Sandia National Laboratories on the basis of a revised conceptual design report dated November 1992. The conceptual design estimate has been escalated by a cumulated total of 1.122 to the anticipated midpoint of construction and at a rate of 1.180 to the anticipated midpoint of Interior and Move-in (occupancy) construction. Escalation was based on DOE departmental price change index for construction projects within defense programs and general construction guidance dated August 1993.

10. Method of Performance

Design and inspection shall be performed under a negotiated architect-engineering contract. Construction and procurement shall be accomplished by fixed-price contracts awarded on the basis of competitive bidding.

1. Title and Location of Project: Processing and Environmental Technology Laboratory, Sandia National Laboratories, Albuquerque, New Mexico	2a. Project No. 96-D-104 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line Item -- Narrative not required.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete project -- None.
      (b) Conceptual design costs -- Prepared by Dekker and Associates, Architects, Albuquerque, New Mexico, in January 1990, and then revised in November 1992.
      (c) Decontamination and Decommissioning -- None.
      (d) NEPA documentation costs -- An Environmental Assessment is currently being prepared.
      (e) Other project related costs -- Include in-house engineering support, project development and project management costs prior to authorization, a Safety Assessment, and non-dedicated support activities throughout this project life.

b. Related annual costs (estimated life of project--50 years)
   Annual operating cost will be reduced as a result of improved system reliability, modern equipment and systems, and higher efficiencies. This project relocated existing activities to a new facility under revitalization. The estimated useful life of this new facility is estimated at 50 years. Operating costs, maintenance and repair costs and utility costs are estimated for typical office/laboratory facilities at SNL/NM. Capital Equipment figures are not related to construction, but estimated to maintain annual programmatic effort. Programmatic operating expenses include salaries and supplies for approximately 240 people estimated at $229,518 per person per year.

SIGNIFICANT CHANGES

- The TEC has increased from $47,900,000 to $49,700,000 and the TPC from $50,635,000 to $52,765,000 because of a change in allocation of overhead and indirect costs, based on DOE Budget Call Instructions, plus a hardening of change room/shower facility to protect against an accidental detonation, addition of a fast-acting personnel door in the blast chamber, addition of a new communications cable, and an increase in parking spaces and provisions for truck access.

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $ 47,900
Total Project Cost (TPC) -- $ 50,635

4a. Date Physical Construction Starts: 4th Qtr. FY 1997

4b. Date Construction Ends: 3rd Qtr. FY 1999

6. Current Cost Estimate:
TEC -- $ 49,700
TPC -- $ 52,765

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1996	$ 6,600	$ 0	$ 6,600	$ 4,900
1997	17,100	0	17,100	10,400
1998	19,300	0	19,300	23,400
1999	6,700	0	6,700	11,000

8. Project Description, Justification and Scope

The TEC has increased from $47,900,000 to $49,700,000 and the TPC from $50,635,000 to $52,765,000 because of a change in allocation of overhead and indirect costs, plus a hardening of change room/shower facility to protect against an accidental detonation, addition of a fast-acting personnel door in the blast chamber, addition of a new communications cable, and an increase in parking spaces and provisions for truck access.

The Contained Firing Facility Addition is a capability addition to the Flash X-Ray Facility at Lawrence Livermore's Site 300.

This project is a facility of approximately 28,900 SF, consisting of four related structures, for increasingly safe and environmentally compliant firing of explosive charges up to a 60 kg limit of energetic high explosives. This project builds on to the existing 8801 firing bunker at the existing firing table site adjacent to 8801.

The four structures are a structurally reinforced Firing Chamber, a Support Facility, a Diagnostic Equipment Facility and an Office Module.

The Firing Chamber is designed to contain the effects of cased high explosive materials used in various laboratory experiments. The explosive quantities vary in operational weight up to approximately 60 kg, or an equivalent TNT design weight of approximately 206.3 pounds. The chamber must be protected from shrapnel from explosive casings. All major structural elements are to remain elastic to permit repetitive chamber usage with no structural damage.

1. Title and Location of Project: Contained Firing Facility Addition Lawrence Livermore National Laboratory, Livermore, California (Continued)	2a. Project No. 96-D-105 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The restraints imposed by the number and pattern of the existing camera ports, whose inclusion within the chamber is required, led to the selection of a chamber, of approximately 3,700 SF. In this configuration loads are resisted by structural elements acting primarily in tension-flexure combination. The interior surfaces of the chamber will have a steel liner on the walls and ceiling and the floor. In addition, the walls and ceiling will have layers of removable mild steel plate for shrapnel protection, and the floor will be covered by a steel plate anvil directly under the firing area. The Firing Chamber includes a blast effects door to permit vehicle entry, blast effects doors for personnel entry, and numerous smaller openings for air ducts, diagnostic ports, cable penetrations and TV camera, all protected against shrapnel and pressure damage.

At B801 the existing bullnose will be cut away and be rebuilt as part of the new Firing Chamber. The existing Camera Room at this location will be retained, the chamber floor will be configured in order to accommodate the present camera room roof.

The Support Facility of approximately 16,600 SF provides a staging area for experiment preparation, storage of equipment and materials used, and personnel areas for lockers, toilets and decontamination showers. A mezzanine above the personnel area is used for mechanical equipment with an additional mechanical equipment area adjacent to the staging are. The Support Facility is comprised of non-bearing tilt-up reinforced concrete panel walls supported structurally by a rigid steel frame system. The roof is metal deck and concrete with insulation and a single ply roofing system.

The Diagnostic Equipment Facility of approximately 6,200 SF is similar to the Support Facility and has non-bearing, tilt-up reinforced concrete panel walls supported structurally by a rigid steel frame system. The roof is a metal deck with concrete, insulation, and a single ply roofing system. The interior space will be open to accommodate a variety of diagnostic equipment. Adjacent to the perimeter wall will be a new stair going down to an extended corridor which will lead into the existing facility for complete interior access to all areas. The wall will have penetrations for a variety of diagnostics. Access to the Support Facility will be from the diagnostic area through the locker, shower, toilet complex. The diagnostic area will have both fluorescent and dimmable incandescent light fixtures, a wet pipe sprinkler system, and an HVAC system with 95% efficient final filters. The space will also have floor drains and low conductivity water piping. These facilities will require extensive earthwork.

The Office Module of approximately 2,400 square feet will consist of 7 offices for permanent staff and visiting experimenters, a conference room and open areas for file cabinets and partitioned desk space.

Access at B801 will be by means of new and existing roads. Drive areas around the Support Facility will be paved. A paved parking lot will be provided to replace parking stalls displaced by new facilities as well as accommodate the increase in visitors and facility users. A net total of 21 parking spaces will be added. Non-hazardous sewage disposal for the proposed facilities will be by means of a new septic tank and leach field system at B801.

The Firing Chamber and Support Facility areas will have an air conditioning system consisting of air handling units with prefilters, final filters, energy recovery coil, direct expansion coil, electric resistance heaters, and a supply fan. The Firing Chamber purge system will consist of a supply fan and a pollution control system with cartridge dust collectors, prefilters, High Efficiency Particulate Air (HEPA) filters, wet scrubbers, and an exhaust fan.

Tasks associated with all buildings include the material handling system, instrumentation and control system, washwater control system, waste water filtration system, process utilities, and environmental compliance for airborne and waste water discharge from the facility. Material handling will be accomplished by providing a specially designed mobile crane with a capacity of 40 tons. Washwater control includes automatic and manual washdown for the Firing Chamber itself; while the other areas require only a manual washdown system. Process gases to be supplied to the facility include argon, methane, compressed air, vacuum, helium and nitrogen. Environmental control requires the monitoring of combustion gases and waste water. To obtain a complete material balance, a number of unique measuring devices will be provided.

1. Title and Location of Project: Contained Firing Facility Addition Lawrence Livermore National Laboratory, Livermore, California (Continued)	2a. Project No. 96-D-105 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The purpose of this project is to minimize hazardous emissions to the environment, reduce quantities of hazardous waste, and to provide a continuing capability to test the high explosive component of a nuclear weapon. These goals will be achieved through the design and use of a contained firing chamber and support structures at LLNL's existing firing site Bunker 801 at Site 300.

Lawrence Livermore National Laboratory maintains and operates open-air high explosive test facilities at Site 300 as part of their Stockpile Stewardship Program. Many of the devices involved in these tests contain toxic and/or low level radioactive materials (depleted uranium). At present, the firing operations at these facilities are in compliance with all applicable environmental laws. However environmental standards are evolving at a rapid pace and it is expected that our open-air explosive testing will come under increased scrutiny as these regulations become more stringent.

This project will be the pacesetter in the area of explosive testing technology. The project will provide the capability to reduce to negligible levels the emissions of hazardous materials into the environment during and after explosive testing and will reduce the total amount of hazardous wastes generated. In addition it will provide a safer work environment, fully compatible with evolving plans for nearby commercial/residential development.

The testing areas at Site 300 offer combined diagnostic capabilities that exist nowhere else. Most test shots are one-of-a-kind, each being assembled under the day to day scrutiny of the weapons designer. Since most shots are of a development nature, it is important that they be transported a minimum distance from their assembly point to the test facility. Finally, because the intense level of interaction between the weapon designer, the shot diagnosticians and firing facility operators, these testing facilities must be located close to the design laboratory.

An essential ingredient of all nuclear weapons is the chemical high explosive component which provides the energy necessary to drive the fissile material to criticality, producing the initial fission yield. The shaping and timing of the detonation wave in the high explosive component is crucial to weapon performance. The sensitivity of the high explosive component to abnormal environments determines weapon safety. The testing facilities at Site 300 are dedicated to these necessary studies of weapon performance and safety.

The Site 300 Contained Firing Facilities Addition requested herein are required for three reasons:

1. Environmental consideration
2. Operational and cost saving advantages
3. Flexibility in application of diagnostic technology

Environmental Requirements

Environmental regulations require that hazardous materials be accounted for and tracked from their point of generation to their disposal. This regulation may soon be applied to LLNL site 300 high explosives testing operations. A contained Firing Chamber provides an intrinsic solution to the issue of accountability since no uncontrolled transfer of these materials from the firing chamber to the environment will occur. This will be true for shrapnel and particulates resulting from the shot as well as the detonation gases themselves. This concept will also apply to water used to clean the inside of the chamber.

1. Title and Location of Project:	Contained Firing Facility Addition Lawrence Livermore National Laboratory, Livermore, California (Continued)	2a. Project No. 96-D-105 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Site 300 has had no close-in residential neighbors since its creation in the early 1950's. However, it is now faced with encroachment of a major residential development along its north and northeast boundaries. Nearby residents may be impacted by blast noise. They may also perceive health risks from low level toxic/radioactive emissions. Controlling the release of blast pressure and potentially hazardous emissions will reduce the public's perception of risk as well as the potential for environment impact.

The quantities of hazardous waste produced from weapons shots will be minimized. Since gravel will not be necessary in the chamber, no contaminated firing table gravel will be produced. Tents and other coverings for experiments used in open air firing, resulting in additional wastes will also be no longer necessary.

Operational Advantages

The time and cost of periodic firing table gravel changeout will be eliminated. Cleanup of shots will be more efficient, producing substantially less total hazardous wastes. Some muster zones and areas of safety control will no longer be necessary with contained firing. The actual firing time of any experiment now depends on weather conditions. When atmospheric inversions exist, blast effects can be focused on surrounding communities (Tracy, Livermore). A contained firing chamber will eliminate this dependency and allow firing at any time, under any weather conditions. The cost of maintaining fire trails and performing extensive burnoff of surrounding hillsides to minimize fire hazards will be reduced. The vault-like nature of the structure will minimize the need for security protection or concerns should an unauthorized individual approach a firing area during a shot. This is a concern that will increase with encroaching residential development.

Flexibility in Diagnostic Technology

The contained firing chamber concept is consistent with the development and application of advanced diagnostic techniques. Such new diagnostics are required in order that reliable new weapons may continue to be put into the arsenal, especially considering the current moratorium on nuclear testing and the pending Comprehensive Test Ban Treaty. Weapons safety testing is another area of increasing importance that will be supported by this facility. Advanced diagnostics include such items as time sequenced x-ray imaging of the detonation, and multiple beam laser velocimetry. Careful design of the enclosed Firing Chamber will further enhance the potential for improved diagnostic by providing an environmentally conditioned space for the test assembly with close-in diagnostic access.

The FY 1997 funds will be used to initiate long-lead procurements and to initiate construction.

1. Title and Location of Project: Contained Firing Facility Addition Lawrence Livermore National Laboratory, Livermore, California (Continued)	2a. Project No. 96-D-105 2b. Construction Funded

9. Details of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management Costs		$ 13,360
(1) Engineering design and inspection at approximately 32.2 percent of construction costs (Item c)	$ 8,210	
(2) Construction management at 7.8 percent of construction costs (Item C)	1,980	
(3) Project management at 12.4 percent of construction costs (Item C)	3,170	
b. Land and land rights		0
c. Construction costs		25,480
1. Improvements to land	760	
2. Buildings	21,050	
3. Other structures	0	
4. Utilities	780	
5. Special facilities	0	
6. Activation	2,800	
7. Security	90	
d. Standard equipment		3,090
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		41,930
i. Contingencies at approximately 18.5% of above costs		7,770
j. Total line item cost (Section 11.a.1.(a))		$ 49,700
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 49,700

10. Method of Performance

Contracting arrangements are as follows:

Design will be on the basis of a negotiated architect-engineer contract. Major equipment requiring long lead time will be purchased by LLNL early in the project on the basis of competitive bidding. To the extent feasible, construction will be accomplished by a fixed-price contract awarded on the basis of competitive bidding. Minor architect-engineering work and activation will be performed by LLNL forces.

a/ Current estimate based on conceptual design revision of January 1995. Escalation is applied according to LLNL Cost Estimating Procedures and LLNL approved escalation rates. This project has been estimated with full overhead. Lawrence Livermore National Laboratory and the department of Energy Oakland Operations Office are in the process of reviewing the possibility of an incremental overhead rate for construction projects. Based on the approval of an incremental overhead rate, the actual rate applied may be less than the project was originally estimated.

1. Facility operating costs	$ 1,027
2. Facility maintenance and repair costs (included in 1 above)	0
3. Programmatic operating expenses directly related to the facility	4,375
4. Capital equipment not related to construction but related to the programmatic effort in the facility	500
5. GPP or other construction related to the programmatic effort in the facility	0
6. Utility costs (included in 1 above)	0
7. Other costs	0
Total related annual costs	$ 5,902

1. Title and Location of Project: Contained Firing Facility Addition Lawrence Livermore National Laboratory, Livermore, California (Continued)	2a. Project No. 96-D-105 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- No narrative required.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- Scale model testing will be performed to provide design basis. Waste stream studies will be performed to certify non-reactivity.
      (b) Conceptual design -- Total funding in this classification represents the conceptual design cost and other studies determined to be necessary.
      (c) Decontamination and Decommissioning (D&D) -- None.
      (d) NEPA documentation -- Support cost for the EA process.
      (e) Other project funding costs -- Project support costs of ADM, PSAR/MPR, FESP, Training Start up, and other related project support costs.

b. Related annual costs

   1. Facility operating costs -- Operating costs of the facility are estimated to be $1,027,000 per year (based on: maintenance costs based on 1.9% of RPV, plus FY 1987 utility/power cost of $3.70 per sq. ft. projected to $6.50 in FY 1994).
   2. Facility maintenance and repair costs -- None.
   3. Programmatic Operating Expenses Directly Related to the Facility -- This estimate is for 25 total programmatic and support personnel at $175,000 average per person in FY 1995, who are currently connected with B801 operations.
   4. Capital equipment not related to construction but related to the programmatic effort in the facility -- This is an average annual estimate which includes both the small items needed for continuous operation of the facility and the occasional large item over $100,000 which cannot be described at this time, but can be predicted as needed to maintain technical excellence in efforts conducted int he facility.
   5. GPP or other construction related to programmatic effort in the facility -- Initially no GPP costs are anticipated but to keep abreast of technology, presently undefined alterations will likely be required in the future.
   6. Utility costs -- None.
   7. Other related costs -- No narrative required.

1. Title and Location of Project: CMR Upgrades Project Los Alamos National Laboratory, Los Alamos, New Mexico	2a. Project No.: 95-D-102 2b. Construction Funded

SIGNIFICANT CHANGES

- TEC decreased from $194,750,000 to $174,100,000 and TPC increased from $204,000,000 to $223,635,000. The construction end date changed from 4th Qtr. FY 2004 to 4th Qtr. FY 2002.

- Changes in project costs and schedules are based upon the 1995 Phase 1 and Phase 2 baseline change proposal and Key Decision 1 approval which includes:

  - Adjustment of cost, schedule, and scope baselines for Phase 1 and Phase 2.
  - Realignment of scope between Phases 2 and 3 based upon NEPA approach and establishment of cost and schedule baselines based upon the completed Conceptual Design Report (CDR).
  - The work performed in Phase 3 is dependent upon future programmatic requirements based upon the results of the Programmatic Environmental Impact Statement and Site Wide Environmental Impact Statement presently being accomplished. Therefore, detailed scope, cost, and schedule for Phase 3 are not specifically addressed at this time.
  - Additional scope for Phase 2.
  - Cancellation of the Special Nuclear Materials Laboratory (SNML) project and moves $1,000,000 of remaining funds from SNML (88-D-105) into the CMR Upgrades project.

WEAPONS ACTIVITIES

a/ Prior to FY 1995, CMR Upgrades Phase 1 was a subproject within Nuclear Weapons Research Development and Testing Facilities Revitalization, Phase III (90-D-102). In FY 1995, Phase 1 was segregated and the scope of Phases 2 and 3 were added to create this stand alone line item.

b/ Changes in project costs and schedules are based upon the 1995 Phase I baseline change proposal and completion of the conceptual design report for the entire Phase 2 and 3 scope. Phase 3 scope, cost, and schedule are contingent upon future programmatic requirements based upon the results of the Programmatic Environmental Impact Statement (PEIS) and Site Wide Environmental Impact Statement (SWEIS). Therefore, detailed scope, cost, and schedule for Phase 3 are not specifically addressed.

c/ $6,250,000 was reprogrammed to CMR, Phase 1 subproject of Nuclear Weapons Research, Development and Testing Facilities Revitalization, Phase III (90-D-102) from Special Nuclear Materials Laboratory Replacement Project (88-D-105). Reprogramming 91-R-14 was executed in FY 1992.

d/ $1,000,000 was reprogrammed by DOE Internal Reprogramming to the CMR Upgrades Project (95-D-102) in the 1st Qtr. FY 1996 from Special Nuclear Materials Laboratory (SNML) replacement project (88-D-105).

1. Title and Location of Project: CMR Upgrades Project, Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No.: 95-D-102 2b. Construction Funded

8. Project Description, Justification and Scope

The Chemistry and Metallurgy Research (CMR) Building is the largest structure at the Los Alamos National Laboratory (550,000 square feet). Construction of the CMR Building was completed in 1952. Most of the major mechanical and electrical equipment has reached the end of its design life.

Since its construction 40 years ago, the CMR Building has been used for research, development, and analytical work with plutonium, uranium and their alloys, and other materials in support of weapons, nuclear materials, and other Laboratory programs. This work continues to be essential to the nation's weapons program, with the principal activities in the building being in support of the plutonium research, development, and demonstration activities conducted at the Laboratory's Plutonium Handling Facility at TA-55. The activities that are critical to these plutonium operations are:

- Essential daily analytical chemistry and metallurgical services on plutonium and other actinides.
  - Analyses of plutonium metal preparations for the Laboratory's Weapons Research, Development, and Test Programs.
  - Analyses required for development and demonstration of new and improved processing methods for scrap recovery.
  - Analyses required for accountability and verification of material received or shipped and for on-site transfers.
- The CMR Building future role is also essential for support of several major Defense Programs areas which include:
  - Enhanced Safety and Reliability of Nuclear Weapons
  - Lead Technical Laboratory for Pu and U Processing
  - Weapons Dismantlement and Component Storage

The primary purpose of this project is to upgrade facility systems and infrastructure that has been in continuous operation for 40 years and are near the end of their useful life. Such upgrading will ensure the continued safety of the public and Laboratory employees and increase the operational safety, reliability and security of essential activities. Increased safety, reliability, and security are critical to the continued operation of the Laboratory's Stockpile Stewardship Programs and other national defense programs.

The Special Nuclear Materials Laboratory (SNML) Project was authorized (88-D-105) to replace the CMR Building at Los Alamos National Laboratory. In FY 1990, the project was put on hold pending a substantive review of the project including other potential options for providing the necessary specialized Laboratory space. As the planned completion date of the SNML continued to be pushed back, it became necessary to provide interim upgrades to CMR to allow its safe and reliable use in the interim period; $6,250,000 was reprogrammed (91-R-14, executed in FY 1992) from the SNML line item to Project 90-D-102, Nuclear Weapons Research, Development and Testing Facilities Revitalization, Phase III (WRD&T Revit., 3), subproject CMR Upgrades (Phase 1). Later in FY 1991, it was decided not to proceed with the construction of SNML but provide interim upgrades, to CMR (Phase 1) and to identify further upgrades based on safety and risk assessment, for continued long-term operations. The result of these safety and risk assessments is an Interim Safety Analysis Report (ISAR). The findings of the ISAR are the basis for the scope of CMR Upgrades Phases 2 and 3, which were combined with Phase 1 to produce this stand alone line item in FY 1995.

The ISAR includes an analysis of risks associated with natural phenomena design basis accidents, current operations, and comparison to criteria (6430.1A). The ISAR was utilized as the basis to identify and prioritize upgrades that would be required to continue operations in a safe, secure, and reliable manner for at least the next 20 years.

1. Title and Location of Project: CMR Upgrades Project, Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No.: 95-D-102 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

a. CMR Phase 1 Upgrade

TEC	Previous	FY 1995	FY 1996	FY 1997	FY 1998	Outyear	Construction Start - Completion Date
$51,600	$38,500	$3,300	$4,800	$4,400	$600	$0	3rd Qtr. FY 1993 - 3rd Qtr. FY 1998

Phase 1 was formerly part of WRD&T Revit, 3 with a TEC of $49,500,000. Based upon the 1995 baseline change proposal and the completion of the CDR, the TEC changed to $51,600,000 and completion date changed from 3rd Qtr. FY 1996 to 3rd Qtr. FY 1998.

Phase 1 of this project consists of required and urgent capital equipment replacements and upgrades in the CMR Building. Individual tasks were initially identified by a panel commissioned by the Deputy Assistant Secretary for Military Application (DASMA) in July 1990, as the minimum essential effort required to maintain operations in the CMR Building while a Safety Analysis Report (SAR) was prepared.

The Fiscal Year 1997 funds for Phase 2 will be used to complete safe standby Electrical Upgrades Wings 2 and 4; Phase 1 Engineering; Project Management, Title III, and Management Reserve.

The equipment replacements and upgrades included:

- **Continuous Air Monitor (CAM) Installations**

  Install a new CAM system in the Wings 3, 5, 7, and 9 laboratories. Upgrades include installation of CAMs, Fixed head Air Samplers (FAS), and glovebox hand monitors as required by DOE Order 5480.11 and AR 3-7. Remote monitoring capabilities at the Health Physics office and a data logging system are also included. Existing vacuum systems in Wings 3, 5, and 7 will be utilized while the vacuum system in Wing 9 will be expanded.

- **HVAC Blowers and Motors**

  Replace existing laboratory exhaust fans in the CMR Building and provide vibration analysis for approximately twenty exhaust fans in the CMR Building. Immediate needs are to replace the 200 HP exhaust fans on the first floor of the filter towers in Wings 3, 5, and 7. Other exhaust fans may require replacement contingent on the scope of the Phase 2 Confinement Zone Separation upgrade.

- **Electrical Upgrades**

  The Distribution Analysis and Power Planning Evaluation and Reporting (DAPPER) software will be used for analysis, calculations, and record drawings for all electrical upgrades. Provisions to incorporate a future facility computer monitoring and limited control system will be provided as part of the Electrical Upgrades.

  Exterior Electrical Upgrades: Replace inadequately sized exterior sectionalizing switches, eliminate existing exterior single point failures, modify exterior underground electrical system to allow switching and maintenance functions, upgrade existing controls and correct deficiencies to the existing administration wing, and Wings 1, 3, 4, and 9 substations.

  Substations Upgrade: Replace substations in Wings 2, 5, and 7.

  Wing Electrical Upgrades: Upgrade the interior low voltage power distribution system for all wings except 2 and 4 in the CMR Building. This includes the replacement of power and lighting panel boards, laboratory power panel boards, bus ways, motor control centers, replacement of all obsolete branch and feeder wiring systems, rewiring of laboratories, and upgrading the emergency and exit lighting systems.

8. Project Description, Justification and Scope (Continued)

Electrical Upgrades to Support Safe Standby, Wings 2 and 4: Upgrade the interior low voltage power distribution system in Wings 2 and 4, which is necessary for safety systems.

Spinal Corridor Cable Tray: Provide a cable tray system in the attic spinal corridor.

Grounding and Lighting Protection: Upgrade the CMR Building grounding and lighting protection systems.

- **Stack Monitors Upgrade**

Provide a stack effluent monitoring system for the CMR Building that is in compliance with DOE and EPA requirements. Each stack will be evaluated to determine the type of monitoring required. Each stack system will be stand alone, consisting of in-line samplers, CAMS, vacuum pumps, and associated tubing, wiring, and signal processing equipment. This upgrade also includes a data collection system from all of the stack CAM's to the CMR operations room and the ES&H operations room. The stack effluent monitoring will be in compliance with 40 CFR 61 and DOE Order 6430.1A.

- **Uninterruptable Power Supply (UPS) Installation**

This Upgrade is in support of the Stack Monitors Upgrade. UPSs will be located in each wing to provide an uninterruptable power source to each of the stack effluent monitoring systems. In addition, there will be one UPS supporting each of the stack monitoring data collection computer systems. Each UPS will be capable of providing backup power to the stack effluent monitoring systems for a 4 hour period.

- **Duct Modification**

Backdraft Dampers: Provide positive shutoff intake backdraft dampers in the supply air ductwork in Wings 2, 3, 4, 5, 7, and 9.

Duct Washdown Upgrade: Upgrade the existing exhaust duct washdown system in Wings 3, 5, and 7. This includes replacement of piping, valves, and spray heads and installation of new flow measurement devices.

- **Sanitary Sewer Upgrades**

This subproject was completed during the 2nd Quarter of FY 1995.

- **Acid Vents and Drains Upgrades**

Aging piping and a lack of gradient in the acid drain system in the basement of the CMR Building has led to corrosion and clogging of the system. This upgrade includes evaluation and documentation of the existing system, prioritization of the system deficiencies, and cost estimates to correct each deficiency for Wings 3, 5, and 7. Construction will include replacement of piping and components including threaded nipples, fittings, valves, flanged fittings, and gaskets with compatible new components. Remaining system replacement will be incorporated in Phase 2.

8. Project Description, Justification and Scope (Continued)

- **Fire Hazard Analysis (Formerly Fire Protection Upgrades)**

  A Fire Hazard Analysis (FHA) on the CMR Building will be completed in accordance with DOE Order 5480.7A. A cost benefit analysis will be performed on the results of the FHA and the existing National Fire Protection Act (NFPA) 101 analysis to prioritize deficiencies. Identified required upgrades will be done as part of Phase 2.

- **Safety Analysis Report**

  Perform a complete safety analysis for the CMR Building operations. Activities include analysis, documentation, and review. Complete an Interim Safety Analysis Report (ISAR) to aid in determining the basis for long term upgrades for the CMR Building. Produce a Final Safety Analysis Report (FSAR) to define the safety envelope and the authorization basis for the operation of the CMR Building. The FSAR is to be produced in accordance with DOE Order 5480.23, and related standards for Nuclear Facility Safety Analysis Reports.

- **Engineering Assessments/CDR/EA**

  Engineering Assessment includes costs for the collection of cataloging of existing CMR facility drawings and the verification and updating of the ISAR drawing set. Work also includes a report of the existing drawing results, the development of CMR configuration controls, and design/construction interfaces in order to maintain up-to-date drawings.

  Phase 1 funding includes the development of the CDR for those items that have been identified and prioritized as a result of the Interim Safety Analysis Report (ISAR). They are comprised of those upgrade items that are required to extend the operational life of the facility for at least another 20 years based upon safety and compliance for present and future operations.

  An environmental assessment, including all aspects of Phase 2, is being prepared based upon the conceptual design report. This EA will assess the environmental impact of construction as represented by the Phase 2 scope of work.

b. CMR Phase 2 Upgrade

The Phase 2 components are needed to maintain infrastructure, improve safety for public and workers, and enhance environmental management.

TEC	Previous	FY 1995	FY 1996	FY 1997	FY 1998	Outyear	Construction Start - Completion Date
$122,500	$0	$0	$6,140	$10,600	$30,400	$75,360	2nd Qtr. FY 1998 - 4th Qtr. FY 2002

Based upon completion of the CDR for the Phase 2 and 3 scope, the TEC for this phase is increased from $85,000,000 to $122,500,000. The construction start date changed from 2nd Qtr. FY 1996 to 2nd Qtr. FY 1998 and the end date changed from 4th Qtr. FY 2003 to 4th Qtr. FY 2002. (Phase 3 scope, cost, and schedule are contingent upon future programmatic requirements based upon the results of the Programmatic Environmental Impact Statement (PEIS) and Site Wide Environmental Impact Statement (SWEIS). Therefore, detailed scope, cost, and schedule for Phase 3 are not specifically addressed.)

The FY 1997 funds for Phase 2 will be used to begin Wings 2 and 4 safe standby, complete Phase 2 Title I, begin Phase 2 Title II and Title III activities and cover project and construction management costs.

1. Title and Location of Project: CMR Upgrades Project, Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No.: 95-D-102 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The additional long term upgrades developed by the Phase 2 CDR process are:

- **Seismic and Tertiary Confinement**

  Structural strengthening of Wings 3, 5, 7, and 9 to meet the seismic criteria for hazard Category 2 operations. Modification of the existing exterior structural openings in these wings to create a tertiary confinement barrier. Structural strengthening of the Administration Wing (which houses the Operations Center) to meet the seismic criteria for worker safety.

- **Security (Related to Tertiary Confinement)**

  Hardening of building openings of Wings 3, 5, 7 and 9 to security requirements which are also being modified for tertiary confinements. These openings include doors, windows, louvers, etc. This upgrade will be integral with seismic tertiary confinement.

- **Ventilation Confinement Zone Separation (Winds 3, 5, 7, and 9)**

  Renovate the mechanical systems and the related control systems in Wings 3, 5, 7, and 9 to replace components that are near the end of their useful lives and to improve confinement zone separation throughout each Wing. Architecturally modifying Wings 3, 5, and 7 to create a secondary confinement barrier. Providing an alarm for each enclosure to alert workers when the mechanical systems are not operating according to safety standards for the facility. Providing a central, chilled water plant to support the mechanical systems' renovations to the building.

- **Standby Power/Communications**

  Provide standby electrical power to operate the most important mechanical systems in Wings 3, 5, 7, and 9 at a reduced level sufficient to maintain negative pressure in the laboratory enclosures. This will reduce possibility of spread of contamination due to the loss of offsite power to the ventilation system. In addition, emergency communications systems in Wings 3, 5, 7, and 9 will be improved, thereby improving worker safety.

- **Wing 1 Upgrades (HVAC)/Wing 1 Interim Decontamination**

  Decontaminate the unoccupied, contaminated laboratories in Wing 1, modifying the HVAC exterior intake and exhaust locations for Wing 1 to improve worker health and safety.

- Operations Center

  Improve the ergonomics and reliability of the building's central monitoring and control capabilities.

- Chilled Water Upgrade Wings 3, 5, and 7 e/

  Replace the 2 existing 40 year old evaporative coolers in each Wing with a single refrigeration unit to provide chilled water for process equipment. Also, replace the existing 40 year old process chilled water piping system with a new piping system.

---

e/ Phase 2 additional scope added to support long-term infrastructure upgrades. Each activity was added at the end of the CDR process and are pre-CDR estimates. Conceptual design effort for these activities is ongoing.

8. Project Description, Justification and Scope (Continued)

- Main Vault e/

  CAMs - Install new Canberra CAMs in the vault, ASM 2000 controllers in the anteroom, and incorporate remote monitoring (similar to Wing CAM systems) to the ES&H office. This upgrade would utilize the generic design established for the Wing CAMs and add the appropriate layout for the vault.

  Dampers - Install seismic dampers in the ventilation ducts of the main vault.

- Acid Vents and Drains Wings 3, 5, and 7 e/

  Correct deficiencies not covered in Phase 1 upgrades (Phase 1 addresses major leaks and flanges). Correct area with inadequate slope, replace branches and risers to laboratories as required, and upgrade the ventilation of the system.

- Fire Protection Upgrades e/

  Correct fire protection system deficiencies as identified in the 1992 NFPA 101 analysis, and the Fire Hazard Analysis (to be completed in Phase 1). Deficiencies will be prioritized in a cost benefit analysis which will be completed in Phase 1. Examples of current identified deficiencies are: Add check valves in fire protection risers, add backflow preventors in the sprinkler system, provide fire dampers in duct penetrations, replace fire alarm panels.

- Operations Center Standby Power e/

  Install transfer capability and wiring from the standby power generator (Phase 2) to the CMR Operation Center to support all functions or systems required to recover the facility after significant accidents.

- Exhaust Duct Washdown Recycling System Wings 3, 5, and 7 e/

  This recycling system will significantly reduce the waste stream from the facility. The reduction in the waste stream will reduce the demands on the current waste treatment plant.

- **Wings 2 and 4 Safe Standby** e/

  This upgrade includes the costs necessary to establish a safe standby condition for Wings 2 and 4 pending future programmatic use. Included are identification of safety systems required for safe standby deactivation/decontamination of abandoned systems and gloveboxes, removal of all radioactive materials and chemicals, and removal or stabilization of all loose contamination.

- **ES&H Support Activities**

  Additional enhanced ES&H support activities based on the lessons learned from Phase 1 are currently being evaluated as part of the additional conceptual effort. These are beyond the costs identified in the CDR. These efforts include waste management, waste minimization, ES&H support, risk analysis, and ES&H equipment including personnel protective equipment. These costs may be added to the project TEC upon completion of an estimate validation to be completed during the 1st Quarter of FY 1996.

---

e/ Phase 2 additional scope added to support long-term infrastructure upgrades. Each activity was added at the end of the CDR process and are pre-CDR estimates. Conceptual design effort for these activities is ongoing.

8. Project Description, Justification and Scope (Continued)

c. CMR Phase 3 Upgrades

The work to be performed in Phase 3 is dependent upon future programmatic requirements and the results of the Programmatic Environmental Impact Statement and Site-Wide Environmental Impact Statement presently being accomplished. Therefore, detailed scope, cost and schedule for Phase 3 are not specifically addressed at this time.

9. Detail of Cost Estimate b/ f/

SUBPROJECTS	PM & S	ED&I	CONST	STD EQUIP	CONTINGENCY	TEC
a. Phase 1						
Sanitary Sewer Modifications	$ 0	$ 64	$ 68	$ 0	$ 13	$ 145

Project Management/Construction Management	16,621	0	0	0	2,486	19,107 h/
Subtotal ED&I/Project Management	$ 16,621	$ 15,476	$ 0	$ 0	$ 5,265	$ 37,362
Phase 2 Subtotal	$ 16,621	$ 15,476	$ 67,797	$ 0	$ 22,606	$122,500
Total Estimated Cost	$ 27,801	$ 29,225	$ 86,305	$ 4,026	$ 26,743	$174,100

b/ Changes in project costs and schedules are based upon the 1995 Phase I baseline change proposal and completion of the conceptual design report for the entire Phase 2 and 3 scope. Phase 3 scope, cost, and schedule are contingent upon future programmatic requirements based upon the results of the Programmatic Environmental Impact Statement (PEIS) and Site Wide Environmental Impact Statement (SWEIS). Therefore, detailed scope, cost, and schedule for Phase 3 are not specifically addressed.

f/ In addition, the estimates do not include site overhead/landlord costs since FY 1992 was the first year of project funding.

e/ Phase 2 additional scope added to support long-term infrastructure upgrades. Each activity was added at the end of the CDR process and are pre-CDR estimates. Conceptual design effort for these activities is ongoing.

h/ Estimates include CDR estimates for original scope and pre-CDR estimates for additional scope.

1. Title and Location of Project: CMR Upgrades Project, Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)

2a. Project No.: 95-D-102
2b. Construction Funded

9. Detail of Cost Estimate b/ f/ (Continued)

Contingencies represent approximately 21 percent of costs. The laboratory is using escalation rates of 2.6% for 1994, 2.7% for 1995, 3.0% for 1996, 3.3% for 1997 and 1988, 3.2% for 1999, and 3.1% for 2000 through 2002. These rates were taken from Departmental Price Change Index, FY 1994 Guidance, dated August 1992.

Engineering, design, and inspection cost-of-services were estimated from historical records and experience with drawing and man hour requirements established for each discipline, ED&I represent about approximately 34% of construction costs.

The contingency rate is the result of a contingency analysis of various items based on relative risk ratings compared to ratings of relative importance of a particular item to the project. The analysis of various items results in different contingency rates depending on the item. The contingency rate shown here is an average rate resulting from the contingency analysis and weighing according to the item's relative cost.

10. Method of Performance

Procurement will be accomplished under fixed-price subcontracts awarded on the basis of competitive bidding. Consideration will be given to cost-plus-fixed fee on decontamination and refurbishment work on the CMR. Upgrades construction will be done by fixed price contractors and the Laboratory's support services subcontractor. The operating contractor and contracted Architect-Engineers will perform construction inspection.

b/ Changes in project costs and schedules are based upon the 1995 Phase I baseline change proposal and completion of the conceptual design report for the entire Phase 2 and 3 scope. Phase 3 scope, cost, and schedule are contingent upon future programmatic requirements based upon the results of the Programmatic Environmental Impact Statement (PEIS) and Site Wide Environmental Impact Statement (SWEIS). Therefore, detailed scope, cost, and schedule for Phase 3 are not specifically addressed.

f/ In addition, the estimates do not include site overhead/landlord costs since FY 1992 was the first year of project funding.

Total facility costs (Federal and Non-Federal)	$ 31,685	$ 18,000	$ 14,023	$110,392	$174,100	
2. Other project costs						
(a) R&D necessary to complete project	$ 0	$ 0	$ 0	$ 0	$ 0	
(b) Conceptual design costs	0	0	0	0	0	g/
(c) Decontamination & Decommissioning (D&D)	0	0	0	0	0	
(d) NEPA documentation costs	0	0	0	0	0	g/
(e) Other project related costs	5,435	3,110	2,423	38,567	49,535	
(f) Total other project costs	$ 5,435	$ 3,110	$ 2,423	$ 38,567	$ 49,535	
(g) Total project costs	$ 37,120	$ 21,110	$ 16,446	$148,959	$223,635	
(h) LESS: Non-Federal contribution	0	0	0	0	0	
(i) Net Federal total project costs (TPC)	$ 37,120	$ 21,110	$ 16,446	$148,959	$223,635	

b. Related annual costs (estimated life of project--20 to 40 years)	
1. Facility operating costs	$ 10,000
2. Facility maintenance and repair costs	2,500
3. Programmatic operating expenses directly related to the facility	30,000
4. Capital equipment not related to construction but related to the programmatic effort in the facility	1,000
5. GPP or other construction related to programmatic effort in the facility	1,000
6. Utility costs	2,450
7. Other costs	0
Total related annual costs	$ 46,950

g/ CDR and Environmental Assessment costs are carried as part of the Phase 1 Engineering Activities/Phase 2 Planning Activities and are broken out for clarity.

1. Title and Location of Project: CMR Upgrades Project, Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No.: 95-D-102 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- Narrative not required.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- Narrative not required.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- No research and development is necessary to establish the specific design and construction features.
      (b) Conceptual design -- None. Phase 1 line item. g/
      (c) Decontamination and Decommissioning (D&D) -- None.
      (d) NEPA documentation -- None. Phase 1 line item costs include NEPA documentation costs. g/
      (e) Other project related costs -- Operational testing and acceptance, including the Operational Readiness Review has been allowed on selected major system upgrades. Training materials, programs, and test/certification will be updated to reflect the change in site operations resulting from selected systems upgrades becoming operational. See also paragraph 17, Environmental Impacts, below.

b. Related annual costs
   1. Facility operating costs -- The CMR facility were estimated from the FY 1995 budget requirements for CMR operations.
   2. Facility maintenance and repair costs -- These are based upon current budget requirements for CMR maintenance.
   3. Programmatic operating expenses directly related to the facility -- The programmatic effort which relies upon the direct and primary use of the CMR facilities was established at the FY 1992 level-of-effort based on the unique capabilities of handling radioactive materials. This assumes a constant level-of-effort in these programs.
   4. Capital equipment requirements for programmatic support were estimated at $1,000,000/year based upon recent trends in CMR programmatic needs.
   5. GPP or other construction related to programmatic effort -- These are anticipated to be approximately $1,000,000/year based upon current CMR programmatic needs.
   6. Utility costs -- These are estimated at $2,450,000/year based upon current trends in CMR operations.
   7. Other costs -- None anticipated.

141

g/ CDR and Environmental Assessment costs are carried as part of the Phase 1 Engineering Assessment/Phase 2 Planning Activities and are broken out for clarity.

Total Estimated Cost (TEC) -- $34,300
Total Project Cost (TPC) -- $34,600

4a. Date physical Construction Starts: 2nd Qtr. FY 1994

4b. Date Construction Ends: 2nd Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $36,987
TPC -- $37,387

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1994	$ 4,000	$ 0	$ 4,000	$ 419
1995	13,000	0	13,000	5,365
1996	12,200	0	12,200	17,318
1997	7,787	0	7,787	10,885
1998	0	0	0	3,000

8. Project Description, Justification and Scope

The TEC was increased from $34,300,000 to $36,987,000 and the TPC from $34,600,000 to $37,387,000 to add a second source of power for the 115 kilovolt loop. This is done to retain the same power redundancy as the existing Sandia Power System.

This series of projects provides for the construction of new facilities, and modifications, relocations, and additions to existing facilities for the nuclear stockpile stewardship facilities at Sandia National Laboratories (SNL), Los Alamos National Laboratory, Lawrence Livermore National Laboratory, and the Nevada Operations Office. These projects are a multiyear capital investment program to provide new or additional capabilities or capacities to revitalize the nuclear weapons stockpile stewardship complex. These new and modified facilities will replace or add to existing facilities that are overaged, deteriorated, overcrowded, or are inadequate to preserve capabilities required for the current and future weapons stockpile stewardship program.

The nuclear weapons stockpile stewardship program is made up of a highly complex set of activities extremely dependent on current and advanced technology facilities and equipment to meet its varied needs. The successful performance of the stockpile stewardship program contributes directly to the quality and reliability of the nuclear weapons stockpile. In addition to unremitting requirements for reliability and performance, we are committed to pursue new safety and safeguards features for the enduring stockpile. These standards require innovative physics concepts and designs, the development of new materials and material applications, and extension of both engineering and manufacturing technologies beyond the current "state-of-the-art." Without providing the facilities and equipment necessary for this stockpile stewardship effort, the United States risks losing its superiority in nuclear weapons technologies.

1. Title and Location of Project: Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase V, Various Locations (Continued)	2a.Project No.: 94-D-102 2b.Construction Funded

8. Project Description, Justification and Scope (Continued)

The revitalization effort was initiated in FY 1984 with Project 84-D-107, Nuclear Testing Facilities Revitalization, and was followed in FY 1985 with Project 85-D-102, Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase I, and in FY 1988 with Project 88-D-106, Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase II, in FY 1990 with Project 90-D-102, Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase III and in FY 1992 with Project 92-D-102, Nuclear Weapons Research, Development and Testing Facilities Revitalization, Phase IV. These projects were defined based on needs identified by representatives from the Albuquerque and Nevada Field Offices, and the three weapons laboratories. Since the initiation of these projects, all aspects of the stockpile stewardship complex capital asset base continued to be critically reviewed and have resulted in the initiation of this line item project which contains one subproject.

The consolidation of the nuclear weapons stockpile stewardship revitalization needs into one project data sheet focuses the issue of the total needs of the stockpile stewardship program. With the decreased demand for new weapon systems, this project is oriented toward preserving the critically needed infrastructure at the laboratories.

Subproject 01 - Power System Modernization, Sandia National Laboratories, Albuquerque, New Mexico.

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$36,987	$4,000	$13,000	$12,200	$7,787	$0	1st Qtr. FY 1994 - 2nd Qtr. FY 1998

This project will replace the electrical transmission and distribution service to Sandia National Laboratories/New Mexico with a system that meets existing codes and provides for safety, flexibility, growth, and redundancy. Power Systems Modernization will bring building transformers and manholes in all Tech Areas into compliance with National Electric Code and National Electric Safety Code standards, convert the existing 2400 V ungrounded distribution system to a 12.47kV grounded system, and complete a loop of 115kV transmission lines around Tech Area I and provide a second source of power.

This project will:

- Replace all ground-mounted conventional transformers and transclosure-mounted transformers in Tech Areas I, II and IV.
- Convert all other transformers in Tech Areas I to 12.47kV grounded wye looped system from an undergrounded delta system.
- Replace all transclosure mounted and ground mounted conventional transformers with three-phase, padmount 12.47kV transformers in Sandia's remote areas.
- Install 12.47kV cable and duct from the nearest electrical manhole to the new building switchgear and padmount transformer.
- Extend the 115kV system approximately two miles to complete a loop around Tech Area I.

The existing transmission and distribution system at Sandia National Laboratories is antiquated and, in numerous instances, is in violation of National Electric Code standards. These violations present many life threatening hazards to Sandia workers and have potentially detrimental effects on the SNL mission.

Out of 95 manholes at Sandia, 56 have non-submersible topboxes. Some of these have already failed when exposed to rain or ground water. This presents a hazard to a worker attempting to test or maintain electrical equipment in one of these manholes. Additionally, many of these

8. Project Description, Justification and Scope (Continued)

manholes do not meet the minimum safe working clearance criteria required by the National Electric Code, again exposing workers to unnecessary risk. There are 31 ground mounted conventional building transformers and 37 transclosure mounted installations that do not meet the standard of two separate conscious acts to come into contact with an energized system. A worker or unqualified person could come into contact with an energized system by a single conscious act such as; climbing a fence, opening a gate, or opening a transclosure door.

The existing ungrounded distribution system is itself a hazard to workers. The first fault on this system is undetectable. If a fault has occurred and a worker attempts to place a ground on the system to perform maintenance, the ground is in effect the second fault on the system. The result would be catastrophic and would, in all likelihood, kill the worker. This is being prevented now by placing administrative controls on the worker to always check a system for a fault before performing any maintenance. But administrative controls do not provide the level of safety of a properly engineered system.

Because of the configuration of the tapboxes, every transformer on a feeder has to be de-energized in order to work on any part of the system. This also places the worker at risk since the possibility of a feeder being re-energized while a worker is working on a remote part of the feeder is very real. A 1987 power systems study recommended that Sandia and Kirtland Air Force Base replace the 46kV transmission system with a 115kV system. The existing system has very limited load growth capability and is fed from a single source. This project will provide a reliable ring bus. As a result of this study, DOE, Sandia, and Kirtland Air Force Base reached an agreement in November 1987, to connect all future loads to a 115kV system. At present, Sandia/Kirtland is virtually the only remaining PNM (local utility company) customer to use a 46kV system. As a result, PNM has no plans to expand the system beyond its present capacity. However, PNM does maintain an extensive 115kV system and therefore has the necessary equipment and redundancy to provide backup in the event of a single contingency failure. Much of Sandia's electrical equipment is over 40 years old and near the end of its normal life expectancy. Hi-Pot testing is continually identifying 2400V distribution cable in need of replacement. This replacement has to be delayed until it can be scheduled on a weekend to minimize mission degradation. This strategy is unreliable, unsafe, and results in higher maintenance costs. The new system will provide the looping necessary to be able to isolate the problem and repair it immediately. This project will allow Sandia to standardize its equipment with PNM and Kirtland and better coordinate spare stock requirements. The project can provide cost savings not only through reduced line losses, but by facilitating the installation of far better energy efficient transformers.

The addition of the second source 115kV power source maintains the same level of redundancy as exists with the current Sandia Power System.

The present duct banks which contain 9, 12, or 18 conduits are also a concern due to the cable derating factor that has to be considered for cooling. The new system will reduce the number and size of the cables, thereby reducing the cable derating problem.

The timing of the project is to expedite, to the greatest extent possible, the remediation of numerous life-threatening and mission-impacting deficiencies within the Sandia National Laboratories electrical transmission and distribution system. Deferral or denial of the project will sustain an unacceptable situation from a safety perspective, and could ultimately result in injury or serious mission degradation.

The FY 1997 appropriation will be used to complete the replacement or correction of ground mounted conventional building transformers and transclosure mounted transformers in Tech Area I, II and IV. The appropriation will also be used to complete the design of the conversion of the distribution system in Tech Area I to 12.47kV.

2a. Project No.: 94-D-102

2b. Construction Funded

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 6,418
1. Engineering, design and inspection at approximately 14.6 percent of construction costs, Item c (Design, Drawings, and Specifications: $3,210)	$ 3,781	
	1,600	
2. Construction management (Item c)	1,037	
3. Project management at 4 percent of construction costs (Item c)		0
b. Land and land rights		25,936
c. Construction costs	0	
1. Improvements to land	0	
2. Buildings	0	
3. Other structures	25,936	
4. Utilities	0	
5. Special equipment		0
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		32,354
h. Subtotal (a through g)		4,633
i. Contingencies at approximately 14.3 percent of above costs		$36,987
j. Total Line Item Cost (Section 11.a.1.(a)		0
k. LESS: Non-Federal contribution		$36,987
l. Net Federal total estimated cost (TEC)		

This estimate was prepared by Sandia National Laboratories (SNL) on the basis of an in-house conceptual design report. The conceptual design estimate has been escalated to the anticipated mid-point of construction per DOE guidance dated August 1991. The escalation rates for the four categories of construction are: (1) 1.131, (2) 1.184, (3) 1.225, and (4) 1.225.

10. Method of Performance

Design and procurement and construction of 115kV transmission lines will be performed under fixed-price contracts awarded on the basis of competitive bidding. All other sub-projects will be accomplished with SNL, Albuquerque performing the design through in-house capabilities and A-E's performing quality assurance for each sub-project, and awarding multiple discrete construction packages.

1999	0	0	0	0

No funding for this project is requested in FY 1997. This data sheet details scope and schedule changes to this project since submission of the FY 1996 Congressional Budget Request.

a/ Reflects sequestration of funds for FY 1990.
b/ Reflects reprogramming to effect corrective action on construction projects, in accordance with July 23, 1991 correspondence from the Secretary of Energy to Congressional committees (91-R-18).
c/ Application of general reduction included in FY 1995 appropriation.
d/ Reflects cost savings from the Electrical Power System Replacement and Upgrade project.

8. Project Description, Justification and Scope

The construction end date changed from 4th Qtr. FY 1999 to 3rd Qtr. FY 1998 due to the revision in scope requirement for the Fiber Optics Communications Backbone system at LLNL. The total estimated cost (TEC) was decreased from $109,795,000 to $104,409,000 and the TPC from $111,645,000 to $106,259,000 due to the downscoping of the Fiber Optics Communication backbone system and cost savings from the Electrical Power System Replacement and Upgrade project.

This project provided for the construction of new facilities, and modifications, relocations, and additions to existing facilities for the Nuclear Weapons Stockpile Stewardship facilities at the Los Alamos National Laboratory (LANL), the Lawrence Livermore National Laboratory (LLNL), the Sandia National Laboratories (SNL), and the Nevada Test Site (NTS). This project was a multiyear capital investment program to provide new or additional capabilities or capacities to revitalize the nuclear weapons stockpile stewardship complex. These new and modified facilities replaced or added to existing facilities that were overaged, deteriorated, overcrowded, or inadequate to preserve capabilities required for the current and future nuclear stockpile stewardship program.

The nuclear weapons stockpile stewardship program is made up of a highly complex set of activities extremely dependent on current and advanced technology facilities and equipment to meet its varied needs. The successful performance of the program contributes directly to the quality and reliability of the nuclear weapons stockpile. In addition to unremitting requirements for reliability and performance, we are committed to pursue new safety and safeguards features for the enduring stockpile. These standards require innovative physics concepts and designs, the development of new materials and material applications, and extension of both engineering and manufacturing technologies beyond the current "state-of-the-art." Without providing the facilities and equipment necessary for this effort, the United States risks losing its superiority in nuclear weapons technologies.

The revitalization effort was initiated in FY 1984 with Project 84-D-107, Nuclear Testing Facilities Revitalization, and was followed in FY 1985 with Project 85-D-102, Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase I, and in FY 1988 with Project 88-D-106, Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase II. These projects were defined based upon needs identified by representatives from the Albuquerque and Nevada Field Offices, and the three weapons laboratories. Since the initiation of these projects, all aspects of the stockpile stewardship complex capital asset base continued to be critically reviewed and have resulted in the initiation of this line item project which contains six subprojects.

The consolidation of the nuclear weapons stockpile stewardship revitalization needs into one project data sheet focuses the issue of the total needs of the program. With the decrease in demand for new weapon systems, this project is oriented towards preserving the critically needed infrastructure at the laboratories.

Full funding has been provided on all subprojects through prior year appropriations. These projects are:

Subproject 01 - Utilities Upgrade - SNLL Main Electrical Service and Switchgear - Sandia National Laboratories, Livermore, California

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyears	Construction Start - Completion Dates
$5,300	$5,300	$0	$0	$0	$0	4th Qtr. FY 1991 - 4th Qtr. FY 1995

8. Project Description, Justification and Scope (Continued)

Subproject 03 - Electrical Power System Replacement and Upgrades, LLNL, California

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyears	Construction Start - Completion Dates
$28,386 d/	$28,200	$0	$186	$0	$0	1st Qtr. FY 1992 - 2nd Qtr. FY 1997

Subproject 04 - Power Distribution Systems, Nevada Test Site, Nevada

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyears	Construction Start - Completion Dates
$11,521	$12,660	($1,139) e/	$0	$0	$0	4th Qtr. FY 1991 - 4th Qtr. FY 1996

Subproject 06 - Technology Support Center - SNL, Albuquerque, New Mexico

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyears	Construction Start - Completion Dates
$30,000	$26,000	$4,000	$0	$0	$0	2nd Qtr. FY 1992 - 2nd Qtr. FY 1995

a. Utilities/Infrastructure Support Facilities, Various Locations

These subprojects cover general purpose facilities at various DOE locations that are an integral part of the installation support infrastructure. Included are basic utility systems, such as electrical power distribution, sewage, roads, parking lots, gas distribution, water supply, and the like. Many of these facilities were constructed during the 1940s to World War II specifications with a 10-year maximum life expectancy. Many of them are now deteriorated beyond economic repair and do not meet present-day standards for safety and environmental protection.

The FY 1997 funding will be used to continue the construction of these subprojects.

1. Subproject 02 - Site 300 Facilities Revitalization - Part I, Livermore, California

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyears	Construction Start - Completion Dates
$27,400	$21,200	$900	$5,300 f/	$0	$0	1st Qtr. FY 1991 - 2nd Qtr. FY 1998

d/ Reflects cost savings from the Electrical Power System Replacement and Upgrade project, previous TEC was $31,000.
e/ Source of funding to support application of general reduction included in FY 1995 appropriation.
f/ Reflects application of $1,900 of $2,614 cost savings from the Electrical Power System Replacement Upgrade project to complete funding in FY 1996.

8. Project Description, Justification and Scope (Continued)

2. Subproject 05 - Fiber Optics Communication Backbone System, LLNL, California

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyears	Construction Start - Completion Dates
$1,802	$1,088	$0	$714 f/	$0	$0	3rd Qtr. FY 1992 - 3rd Qtr. FY 1998

This project has been rescoped to provide the minimum infrastructure for future fiber optics needs.

This project has completed the design for eight security hardened Node building expansions. The construction of these hardened Node building expansions is no longer required due to a change of DOE security requirements.

The project will upgrade existing Node buildings to a "secure condition" per current security requirements in order to satisfy the current and emerging electronic communications needs, with respect to classified use, in the programmatic areas of Weapons, Lasers, and Chemistry.

Fiber optic cable will be installed and terminated in equipment racks in various combinations of Node buildings and programmatic buildings associated with Weapons, Lasers, and Chemistry.

This project will install single mode and multi-mode fiber optic cable underground to provide the infrastructure for a high-bandwidth backbone for electronic communications at LLNL. The fiber optic cable will be installed using the Nodal system topology introduced by the LLIX telephone project. It will take advantage of the ducts already in place. The cable will be installed between selective nodes buildings and between various program buildings and their associated nodes.

The multi-mode fiber optic cable will be used for classified network communications, and the single mode fiber optic cable will be used for both classified and unclassified network communications. This fiber will also be usable for other applications and specific point-to-point requirements. Besides satisfying Weapons Program needs, it will also be an institutional resource that assures adequate bandwidth availability for current and future program needs.

In addition to the pulling of the fiber optic cable, modifications to several of the Node buildings will be required to create both rack and floor space for the new cables being pulled into the Node buildings. As necessary, some of the Node buildings will also need to be secured because they will contain classified fiber optic cable.

The need for a site wide fiber optic cable facility is becoming more urgent as the demand for more high bandwidth communications to the desktop accelerates. The highest bandwidth communications backbone currently available to classified users is the coaxial cable broadband system of Closed LabNet which is limited to 10Mb/s. The existing Open LabNet backbone for unclassified users is running at 10Mb/s. This existing system is at maximum capacity and lacks sufficient bandwidth for future gigahertz networks, video, and visualization applications.

f/ Reflects application of $714 of $2,614 cost savings from the Electrical Power System Replacement Upgrade project to complete funding for this subproject in FY 1996.

8. Project Description, Justification and Scope (Continued)

Programmatic needs for fiber must be met in a timely and cost effective manner to best serve the Laboratory. It should not be necessary for each program to pull their own fiber when they need it. This practice results in many short fiber pulls of cables with too few fibers in them to satisfy other future needs. Also, this practice will prematurely fill precious limited underground duct capacity which would be extremely expensive to expand.

This project would create a fiber infrastructure which would satisfy current and future needs, while at the same time eliminating the need for frequent short fiber pulls and maximizing the use of the existing duct structure.

9. Details of Cost Estimate g/

	Total Cost
a. Design and Management Costs	
(1) Engineering, design, and inspection	
(2) Construction management	
(3) Project management	
b. Land and land rights	
c. Construction costs	
1. Improvements to land	
2. Buildings and building modifications	$ 104,409
3. Special equipment	
4. Utilities	
5. Demolition	
d. Standard equipment	
e. Major computer line items	
f. Removal cost less salvage	
g. Design and project liaison, testing, and checkout and acceptance	
h. Subtotal (a through g)	
i. Contingency	
j. Total line item cost (Section 11.a.1.(a))	
k. LESS: Non-Federal contribution	
l. Net Federal total estimated cost	$ 104,409

The estimates by location are as follows:

Los Alamos National Laboratory, New Mexico	$ 0
Nevada Test Site, Nevada	11,521
Lawrence Livermore National Laboratory, California	57,588
Sandia National Laboratories, New Mexico, and California	35,300
Total	$ 104,409

g/ This cost estimate is based upon completed individual conceptual design reports.

1. Title and Location of Project: Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase III, Various Locations (Continued) | 2a. Project No.: 90-D-102 | 2b. Construction Funded

10. Method of Performance

Design and procurement of the conventional facilities will be performed under negotiated architect-engineer contracts. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- None.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- None.
      (b) Conceptual design -- None.
      (c) Decontamination and Decommissioning (D&D) -- None.
      (d) NEPA Documentation -- None.
      (e) Other project related funding -- Requirements for these facilities are not considered to be significantly different from those of the facilities and equipment being replaced by this project. Therefore, no costs are shown.

1. Title and location of project: Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase II, Various Locations	2a. Project No.: 88-D-106 2b. Construction Funded

SIGNIFICANT CHANGES

- The total estimated cost (TEC) decreased from $390,119,000 to $303,959,000 and the total project cost (TPC) decreased from $392,950,000 to $336,590,000 due to the following changes:

  - The Dual-Axis Radiographic Hydrotest Facility subproject with a TEC of $81,400,000 and a TPC of $85,600,000 is removed from this line item and is submitted as DARHT project (97-D-102) at an increased TEC.

  - The FY 1998 appropriation request for $3,500,000 for Dormitories, NTS, is cancelled, as the project has been closed out at the current level of funding.

  - Reflects $160,000 reduction from subproject 04, Dormitories, and $1,100,000 from subproject 09, Construction Facilities - Area 6 which were used to offset the requirement for new obligated authority for other activities in FY 1996.

1996	1,500	0	1,500	12,616

8. Project Description, Justification and Scope

No funding is requested for this project in FY 1997. This data sheet details scope and schedule changes to this project since submission of the FY 1996 Congressional Budget Request.

a/ Reflects the sequestration of funds for FY 1990 and the FY 1990 Omnibus reprogramming approved by appropriations subcommittees.
b/ $3,500,000 redirected from prior year appropriation from Dormitories subproject at Nevada Test Site (NTS) to DARHT project, line item 97-D-102.
c/ Reflects $160,000 reduction from subproject 04, Dormitories, and $1,100,000 from subproject 09, Construction Facilities - Area 6 which were used to offset the requirement for new obligated authority for other activities in FY 1996.

1. Title and Location of Project: Nuclear Weapons Research, Development, and Testing Facilities Revitalization, Phase II, Various Locations (Continued)	2a. Project No.: 88-D-106 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The total estimated cost (TEC) of this project decreased from $390,119,000 to $303,959,000 and the total project cost (TPC) decreased from $392,950,000 to $306,590,000 due to the removal of the Dual-Axis Radiographic Hydrotest (DARHT) Facility from this line item and other adjustments due to baseline changes. DARHT is now line item 97-D-102, Dual-Axis Radiographic Hydrotest Facility, Los Alamos National Laboratory.

This project was the third project in a multiphased effort to revitalize the stockpile stewardship complex. Prior projects were line item project 84-D-107 and Project 85-D-102.

This project provided for the construction of new facilities, modificatibns, and additions to existing facilities for the Nuclear Weapons Stockpile Stewardship facilities at the Los Alamos National Laboratory (LANL), the Lawrence Livermore National Laboratory (LLNL), the Sandia National Laboratories (SNL), the Nevada Test Site (NTS), and the North Las Vegas (NLV) ATLAS facilities. This project was a multiyear capital investment program to provide new or additional capabilities or capacities to revitalize the nuclear weapons RD&T complex. These new and modified facilities replaced or added to existing facilities that were overaged, deteriorated, overcrowded, or inadequate to preserve the capabilities required for the current and future nuclear research and development (R&D) program.

Full funding has been provided for all remaining subprojects through prior-year appropriations. These subprojects are:

- Subproject 01 - Integrated Materials Research Laboratory, Sandia National Laboratory, Albuquerque

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 27,900	$ 27,900	$0	$0	$0	$0	2nd Qtr. FY 1990 - 1st Qtr. FY 1995

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total Project Funding
   1. Other Project Funding
      (a) Conceptual Design Costs -- Conceptual design cost of $1,381,000 was necessary to develop cost estimate and construction schedule.

b. Other Related Funding Requirements
   1. The estimated programmatic life of these facilities varies by site and subproject.
   2. The other related funding requirements for these facilities are not considered to be significantly different from those of the facilities and equipment being replaced by this project. Therefore, no costs are shown.

WEAPONS STOCKPILE STEWARDSHIP
INERTIAL CONFINEMENT FUSION

MISSION:
The mission of the Inertial Confinement Fusion (ICF) program is twofold: (1) to investigate theoretical, experimental, and computational high energy density physics essential for stockpile stewardship and (2) to develop and utilize a laboratory-scale microfusion capability for defense and other applications. The program contributes to the nuclear weapons program through increased understanding of the phenomena that occur during a thermonuclear explosion and the simulation of weapon effects.

TECHNICAL BACKGROUND:
ICF uses focused energy from a "driver", typically a laser or ion beam accelerator, to implode and compress a small, spherical capsule shell containing deuterium and tritium (DT) fuel. The "inertia" of the mass of the compressed fuel keeps the reactants together long enough, under the proper conditions, for the ignition and burn to occur. The ICF capsule can be imploded in one of two ways: direct or indirect drive. In the direct drive approach, the driver energy is focused directly onto the capsule to drive the implosion. In the indirect drive approach, the driver energy is directed into a radiation enclosure, or hohlraum, generating a bath of soft x-rays which then drives the capsule. In either case, the irradiation energy is absorbed in the capsule's outer ablator layer. The heated ablator material rapidly blows off. The rocket-like reaction force causes the "pusher" and the remaining portion of the fuel capsule to spherically implode, compressing and heating the DT fuel.

The national ICF program has developed unique capabilities in pursuit of its mission. The laser and pulse power facilities developed under the ICF program, along with their diagnostic, modeling, and target fabrication components, represent the most advanced array of high energy density physics research capabilities in the world. These facilities support science based stockpile stewardship while advancing inertial fusion technology toward a laboratory ignition demonstration with multi-megajoule fusion yields. Over the next five years, most of the ICF resources are allocated to an integrated theoretical and experimental program (high energy density physics studies, target fabrication, laser science, computation, etc.) to advance the technology in support of achieving ignition. Demonstration of ignition and burn in the laboratory is the goal of the proposed National Ignition Facility (NIF), which would use glass laser technology and could be completed by 2002.

The ICF Program will attract and retain highly competent scientists and engineers within the weapons program and enable them to develop and maintain key skills requisite for weapons physics competency. Dual-use benefits of the ICF program include advanced technology development (e.g. optics, lasers, accelerators, materials, microfabrication), increased economic competitiveness, and contributions to basic research and development in high energy density plasma physics.

PROGRAM GOALS:
- Achieve ignition in the laboratory
- Provide access to physics regimes of interest in nuclear weapon design and investigate physics issues
- Expand the aboveground simulation capability for nuclear weapons effects
- Develop diagnostic instruments applicable to weapons research
- Develop and experimentally benchmark computational models by developing three-dimensional simulation capabilities
- Help to anticipate and respond to future national security threats (i.e. nuclear, etc.)
- Attract and retain highly competent scientists and engineers within the weapons program

WEAPONS STOCKPILE STEWARDSHIP - INERTIAL CONFINEMENT FUSION (continued).

PROGRAM FACILITIES:

- **Nova** a ten-beam glass laser located at Lawrence Livermore National Laboratory (LLNL). It is the program's major facility for research on indirect drive laser fusion, and has also made important contributions to stockpile stewardship and basic experiments on high energy density physics. This facility has been operating since 1985.
- **Trident** a smaller glass laser facility at Los Alamos National Laboratory (LANL) used for diagnostic testing and development, as well as weapons and basic physics experiments.
- **Beamlet** a scientific prototype of one beam of the NIF located at LLNL. It began operating experiments in 1994.
- **OMEGA** a 60 beam glass laser used primarily for research on direct drive laser fusion located at the University of Rochester's Laboratory for Laser Energetics (UR/LLE). This facility was upgraded beginning in FY 1991 and achieved Key Decision IV, Project Completion/Start Operations, in May, 1995.
- **Nike** a Krypton-fluoride (KrF) laser located at the Naval Research Laboratory (NRL). It was completed in FY 1995 and will be used primarily to define beam smoothness requirements for direct drive laser fusion.
- **Particle Beam Fusion Accelerator (PBFA II)** the world's most powerful light ion accelerator located at Sandia National Laboratories (SNL).

SIGNIFICANT CHANGES FROM FY 1996:

The significant increase in this program in FY 1997 reflects the request of the second year of line-item funding for the design of NIF. Total project costs in FY 1997 are $191.1 million, an increase of $130.1 million above the FY 1996 level. The increase reflects the shift from non-site specific preliminary design activities in FY 1996 to final detailed design and pre-construction, site specific activities in FY 1997. A decision to begin physical construction is scheduled for mid-FY 1997. The ICF Base Program is held to the FY 1996 level of effort and reflects productivity savings resulting from the Department's Strategic Alignment Initiative.

BUDGET CONTENTS:

The Inertial Confinement Fusion Program has the following major funding categories:

OPERATIONS AND MAINTENANCE (O&M):

- **INDIRECT DRIVE WITH GLASS LASER** supports laser technology development, optics manufacturing and processing, and target physics experiments utilizing the x-ray driven, indirect drive approach to inertial fusion.
- **NIF OTHER PROJECT COSTS** supports the other project (non-construction) costs associated with the NIF project as specified in the Construction Project Data Sheet.
- **DIRECT DRIVE WITH GLASS LASER** supports high performance direct drive cryogenic target implosion experiments utilizing glass laser technology.
- **KRYPTON FLUORIDE (KrF) LASER** supports experimental/theoretical direct drive planar foil research to evaluate target instability induced by laser nonuniformity.
- **LIGHT ION BEAMS** carries out experiments which support science based stockpile stewardship (SBSS) and NIF and develops light ion drivers for a future high-yield capability.
- **CAPSULE FABRICATION AND DEVELOPMENT** supports materials processing and characterization development of targets and hohlraums, including cryogenic targets required by NIF and the OMEGA laser.
- **OTHER** supports independent technical reviews (e.g. Inertial Confinement Fusion Advisory Committee), the National Laser Users Facility, other user activities, and technical support needs of the program.

NOTE: Capital equipment funding has been distributed to the appropriate O&M categories listed above consistent with Congressional direction.

CONSTRUCTION:

- **NIF - CONSTRUCTION PROJECT** (96-D-111) provides line item funding for the Total Estimated Cost (TEC) of the project.

a/ Pending site selection, FY 1997 funding for NIF is reflected at Headquarters.

INDIRECT DRIVE WITH GLASS LASER These activities include computational and experimental efforts necessary to investigate the x-ray driven, indirect drive approach to ICF.

PROGRAM GOALS:

- Address physics issues involving ignition target designs, hohlraum-laser interactions, laser-plasma instabilities, hydrodynamic instabilities, high-power and high-energy glass laser technologies, and diagnostics.
- Gain a better understanding of issues related to ignition, including target physics and plasma physics, which will increase the level of confidence in achieving ignition and reduce the risk associated with the NIF.
- Provide the facilities and expertise necessary to conduct certain weapons related experiments.

CHANGE FROM FY 1996:

Funding reflects productivity savings from the Department's Strategic Alignment Initiative; however, the FY 1996 level of effort is essentially maintained.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
Conducted target physics experiments to investigate the areas of hydrodynamically equivalent physics (HEP) and hohlraum-laser interaction physics (HLP).	Pursue Beamlet experiments in support of glass laser technology development.	Continue target physics experimentation on Nova that includes the study of hydrodynamic mix and benchmarks the new 3D code.
Initiated use of new 3-dimensional (3D) ICF hydrodynamic computer code for modeling high energy and high density implosions.	Complete Nova Technical Contract target physics symmetry/hydrodynamic activities and plasma physics experiments.	Implement full 3D radiation/hydrodynamics modeling of Nova experiments.
Conducted experiments on Nova using gas-filled hohlraums to better understand issues of symmetry and laser-plasma instabilities relative to NIF design and operation.	Conduct ignition design optimization studies and weapons physics experiments on Nova. Identify robust ignition target designs.	Begin fast-ignitor experiments using a petawatt laser beam as a means of possibly achieving higher density plasmas.
Performed full design and sensitivity studies for ignition targets, including targets with carbon hydrogen (CH) and Beryllium (Be) ablators.	Continue 3D code development.	Optimize synthetic-pad polishing technology development for laser system component and transfer technology to optics vendors.
Demonstrated synthetic-pad polishing of optical components to the size and quality needed for NIF optics.	Conduct 100 terawatt (TW) hohlraum-laser experiments in warm plasmas as a prelude to fast-ignitor experiments.	Test, fill, and field demonstrate a Be capsule for OMEGA and NIF.
	Continue experiments on Nova to understand capsule irradiation symmetry in gas-filled hohlraums using plasma densities anticipated for megajoule laser systems.	

FUNDING LEVELS:

$98,175	$104,514	$103,408

NATIONAL IGNITION FACILITY (NIF) OTHER PROJECT COSTS: This category includes only the operations & maintenance (O&M) expenses for NIF for activities such as conceptual and advanced conceptual design, environmental documentation, vendor facilitization and pilot production, startup costs, operational readiness reviews, and technical support as reflected on the NIF Construction Project Data Sheet. These Other Project Costs (OPC) added to the Total Estimated Cost (TEC) equals the Total Project Cost (TPC) for the NIF.

PROGRAM GOALS:

- Ensure the necessary technologies, such as the optical components and potassium dihydrogen phosphate (KDP) crystals, meet criteria needed for successful completion of the NIF.
- Support risk reduction activities to ensure successful completion of the project.

CHANGE FROM FY 1996: The $35.6 million increase reflects manufacturing readiness and vendor facilitization activities for the full year on all of the major optical components needed for the NIF.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997
Received Secretarial approval of Key Decision One, Approval of New Start. Initiated the environmental analysis for NIF included in the Stockpile Stewardship and Management (SSM) Programmatic Environmental Impact Statement (PEIS). Four sites, LLNL, LANL, SNL, and the Nevada Test Site are being evaluated as potential sites for NIF. Issued the Notice of Intent in June, 1995, with public meetings held in various locations in June through August 1995. Developed updated Quality Assurance Plans, Project Execution Plan, and Title I Plan. Initiated non-site specific section of the Preliminary Safety Analysis Report. Initiated Advanced Conceptual Design. Selected an Architectural & Engineering contractor. Participated in public process to determine the non-proliferation impacts of the NIF.	Initiate startup/activation activities, including Operational Readiness Review Planning. Complete the NIF environmental analysis as part of the SSM PEIS and issue a Record of Decision (ROD); site selection will occur after the ROD is completed. Continue to develop detailed Quality Assurance Plans. Complete the Preliminary Safety Analysis Report initiated in FY 1995. Complete the Advanced Conceptual Design, including a detailed proposal to cost-effectively incorporate a direct drive option in NIF. Provide technical support and conduct manufacturing readiness activities for the project. Begin optics facilitization to develop and implement improvements at optics vendors to enable cost-effective production of NIF optical components. Completed the Dellums process and determined that NIF supports U.S. efforts on nonproliferation.	Provide industrial technical support for significant manufacturing readiness activities: - Begin KDP crystal facilitization. - Begin qualification of laser component vendors of critical items needed for construction and operation of NIF. - Begin optics pilot production: hire and train teams, begin small production run, modify equipment and processes. Continue startup/activation activities, including Operational Readiness Review Planning.

FUNDING LEVELS:

$6,000	$23,600	$59,200

DIRECT DRIVE WITH GLASS LASER: These activities address the direct drive approach to ICF which can potentially provide higher gain at a given driver energy.

PROGRAM GOALS:

- Develop an understanding of direct drive target physics to assess the performance of direct drive capsules on the NIF by
  - studying the effects of hydrodynamic instability and drive symmetry on ignition scaling through improvement of the illumination uniformity,
  - developing individual beam-smoothing techniques, and
  - understanding and improving power balance in multibeam laser systems.

CHANGE FROM FY 1996:

Funding reflects productivity savings from the Department's Strategic Alignment Initiative; however, the FY 1996 level of effort is essentially maintained.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
Completed the 60-beam, 30 kJ OMEGA Upgrade Project. Received approval for Key Decision Four, Approval to Commence Operations. Began operations and experimental program.	Operate the upgraded OMEGA laser and conduct direct-drive implosions, planar hydrodynamics, and long-scale-length plasma physics experiments. Investigate OMEGA laser temporal pulse shaping. Characterize the OMEGA laser energy absorption fraction, x-ray conversion efficiency, and mass ablation rate. Support the design and development effort for NIF.	Begin experiments to demonstrate 1.6% RMS (root means square) single beam uniformity on OMEGA, addressing implosion symmetry and energy distribution issues. Perform long-scale-length plasma generation experiments to validate the high gain direct drive NIF target designs. Complete experimental and theoretical analysis necessary for fielding foam buffered direct drive experiments on OMEGA. Begin laser analysis and diagnostics design for power balance on OMEGA. Continue improvements of individual beam uniformity on OMEGA.

FUNDING LEVELS:

$20,765	$20,100	$20,295

KrF LASER: The Krypton fluoride (KrF) laser is a short wavelength laser technology with enhanced laser beam uniformity and efficiency.

PROGRAM GOALS:
- Evaluate the necessary and sufficient laser beam uniformity for direct drive laser fusion.
- Evaluate ablative hydrodynamic instabilities of accelerated flat foils for direct drive targets.
- Support the NIF project by addressing the principal instabilities affecting ignition target performance.
- Evaluate the viability of large KrF laser systems for high gain applications, such as future energy production.

CHANGE FROM FY 1996:
Funding reflects productivity savings from the Department's Strategic Alignment Initiative; however, the FY 1996 level of effort is essentially maintained.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
Completed 56-beam, 4kJ direct drive NIKE laser facility and began operations. Demonstrated, through the use of an optical smoothing technique called Induced Spatial Incoherence (ISI), single beam nonuniformity of 1% RMS in a spatially flat topped beam with a beam tilt of <1%, an order of magnitude lower than existing ICF lasers.	Conduct planar direct drive Rayleigh-Taylor experiments to evaluate various target designs. Demonstrate long wavelength uniform acceleration using colliding flat foil targets. Demonstrate high contrast laser pulse shaping with up to 10 ns total pulse lengths to confirm beam uniformity. Accelerate thick CH targets and evaluate methods to minimize instability growth.	Evaluate the effective threshold for Raman, Brillouin, and two-plasmon instabilities with laser intensities and plasma sizes appropriate to a pellet for a megajoule system. Develop cryogenic deuterium-deuterium (DD) targets along with methods of diagnosing their surface quality. Demonstrate the acceleration of DD targets with adequate uniformity and low enough instability growth to support inertial fusion. Conduct experiments to study the interaction of 10-30 megabar shocks with various structured targets.

FUNDING LEVELS:

FY 1995	FY 1996	FY 1997
$9,620	$8,500	$8,156

LIGHT ION BEAMS: In the light-ion approach to ICF, electrical energy from a pulsed power accelerator is coupled to a magnetically insulated diode to create an intense beam of light ions that can be focused onto a target. Activities support the development of light ion beams as an alternative path for ICF experiments, focusing on two main areas: beam target interaction and beam generation. Support experiments for NIF and SPEAR are also carried out.

PROGRAM GOALS:

- Conduct experiments to address the physics of ion beam/matter interaction: the scaling of hohlraum temperature with power intensity, the effect of beam instabilities and the use of internal pulse shaping.
- Conduct imploding plasma experiments which support both the ICF and weapons programs.
- Develop technology for NIF and continue NIF physics support.
- Develop high-yield technology for applications to weapons effects, weapons physics, and energy production.

CHANGE FROM FY 1996: Funding reflects productivity savings from the Department's Strategic Alignment Initiative; however, the FY 1996 level of effort is essentially maintained.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
Demonstrated ability to increase coupled ion power and decrease ion beam divergence through reduction of the unusable (and often unobserved) portion of the diode current. Achieved a 60 electron volts (eV) hohlraum radiation temperature by focusing an increased brightness lithium beam to an intensity greater than 5 terawatts per square centimeter. Established temperature scaling with power intensity through target experiments on PBFA II. Investigated internal pulse shaping for light ion beam targets. Completed a performance review of the light-ion program by the ICF Federal Advisory Committee which resulted in strong endorsement of the light ion beam program plan.	Demonstrate operation of the lithium ion extraction diode on PBFA II at 8 MV and 1 MA and quantify the beam divergence and efficiency. Initiate experiments with extracted beams at Sandia, NRL, and Cornell University to demonstrate self-pinched transport and solenoidal lens focusing. Begin technology development of power conditioning system, target chamber, first wall, and target positioner for future NIF application. Refine design of an internally-pulse-shaped ignition target for NIF. Develop advanced ion sources for improved uniformity and reduced divergence on SABRE and PBFA-X. Demonstrate the operation of the PBFA-X ion diode at 15 MV and 1 MA. Begin NIF laser pulse-hohlraum interaction experiments.	Generate a radiation temperature of 100 eV and a 10 ns pulse within a hohlraum driven by a z-pinch implosion. Generate an extracted non-protonic beam with beam quality sufficient for transport experiments. Begin planar target experiments with an extraction ion diode on PBFA II to diagnose ion beam/matter interaction physics. Perform fully integrated, two-dimensional deterministic radiative transfer, hydrodynamics calculations of ignition and high-yield (light-ion) target designs. Refine the internally-pulse-shaped concept for ion driven high yield targets and for alternative target designs, based on Nova and OMEGA Upgrade experiments. Demonstrate shock behavior in these targets utilizing x-rays generated in a z-pinch implosion. Continue NIF laser pulse-hohlraum interaction experiments.

FUNDING LEVELS:

$26,200	$27,481	$26,369

CAPSULE FABRICATION AND DEVELOPMENT: Activities include the development and manufacturing of various complex, well-characterized, indirect and direct drive targets and target components which meet stringent specifications. Various levels of effort are conducted at the five ICF laboratories (LLNL, LANL, SNL, UR/LLE, and NRL) and by the ICF target support contractor, General Atomic. An ICF target consists of a millimeter-scale, fuel-containing "capsule" which may be enclosed in a vacuum- or gas-filled radiation case called a "hohlraum", mounted with a low-mass fiber web, or mounted in a low density foam-filled hohlraum. Current ignition target designs require cryogenic fuel in the capsules. Technological challenges include: producing targets with cryogenic layers of sufficient smoothness and uniformity; maintaining targets at cryogenic temperature during transportation to target chamber center; and performing final alignment.

PROGRAM GOALS:

- Develop procedures and techniques to provide capsules with known perturbations for testing stability.
- Develop advanced fabrication and layering techniques needed to produce cryogenic targets.
- Develop methods and systems for the characterization, transport, and insertion of targets into the target chamber.

CHANGE FROM FY 1996: Funding reflects productivity savings from the Strategic Alignment Initiative and essentially maintains the FY 1996 level of effort for capsule fabrication and development efforts.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
Fabricated and characterized approximately 900 sophisticated, specialized Nova targets; 1,100 Trident targets; 500 NIKE planar targets; 250 PBFA-II targets and components; and 600 OMEGA capsules. Developed techniques to provide capsules with known perturbations for testing stability and mix theory. Pursued joining and smoothing techniques for the fabrication of ignition type beryllium capsules. Constructed a prototype cryogenic fill system and began conceptual design of the cryogenic target insertion system for OMEGA. Continued development of cryogenic fuel layers with smooth surfaces for OMEGA and NIF.	Continue to develop, fabricate, and characterize targets (capsules and other components) for the experimental programs at the five ICF laboratories. Continue development of the cryogenic target transport, layering, characterization, and insertion systems for OMEGA. Develop advanced fabrication techniques needed for ignition targets, including the formation of cryogenic fuel layers and beryllium shell fabrication in support of NIF.	Continue to develop, fabricate, and characterize targets (capsules and other components) for the experimental programs at the five ICF laboratories. Demonstrate cryogenic layering technology which satisfies the requirements for cryogenic target production for NIF. Complete the cryogenic deuterium-tritium fill, layering and characterization systems for OMEGA and begin overall system assembly and integration. Continue development of cryogenic targets for OMEGA. Demonstrate fabrication technology and techniques for NIF plastic capsules.

FUNDING LEVELS:

$14,425	$15,823	$15,184

OTHER: This category includes activities which support the goals of the national ICF program, including independent technical reviews (such as the Inertial Confinement Fusion Advisory Committee), the National Laser Users Facility (NLUF), and contract support for technical assistance. Some funding is also distributed from DOE Headquarters to the five ICF laboratories and the target contractor to meet critical and high priority needs as they arise.

PROGRAM GOALS ONGOING ACTIVITIES:

- Provide support to high priority activities that contribute to the goals of the national ICF program
- Provide advice and guidance to the Assistant Secretary for Defense Programs in both technical and management aspects of the ICF program and the development of NIF
- Allow outside researchers to use the ICF facilities (such as the National Laser Users Facility (NLUF) program and the outside users effort on Nova)

CHANGE FROM FY 1996

Funding supports ongoing activities with a minimal amount to meet unanticipated high priority needs as they arise.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
Support the independent technical reviews by the Inertial Confinement Fusion Advisory Committee Provide unique technical support to the ICF program	Support the final meeting of the Inertial Confinement Fusion Advisory Committee (Charter expired the end of 1995) Support the NLUF program on the upgraded Omega laser Initiate an independent advisory group to provide a technical review of the ICF program Support a one-time 3D radiation/hydrodynamic simulation code development activity at the University of Rochester's Laboratory for Laser Energetics	Support independent technical review of the ICF program by an independent advisory group Support the NLUF program and other outside user programs Provide unique technical support to the ICF program

FUNDING LEVELS:

$928	$2,943	$1,948

172

Project 96-D-111, NATIONAL IGNITION FACILITY: By producing ignition and modest energy gain in ICF targets, NIF could provide weapon-related physics data needed for the computational simulations that underpin the Department's stockpile stewardship efforts. In addition, NIF can provide simulation capability to study nuclear weapon effects on strategic, tactical, and space assets; serve as a magnet program to retain and attract scientific and technical talent to Defense Programs to conduct leading-edge scientific research; and provide critical ignition data to enable the development of civilian inertial fusion energy.

PROGRAM GOALS:
- Provide information needed to make a decision on physical construction on NIF in mid-FY 1997.
- Design a neodymium laser system of 192 beams, with each beam optically independent.
- Demonstrate a production capability for laser optical components.
- Design a laser and target area facility capable of producing an output pulse with an energy of 1.8 million joules.

CHANGE FROM FY 1996: The increase in FY 1997 reflects the shift from non-site specific Title I/Preliminary Design to Title II/Final Detailed Design and pre-construction, site specific preparation activities. A decision to begin physical construction is scheduled for mid-FY 1997. Complete information is provided in the Construction Project Data Sheet located at the end of the narrative budget justification.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995: No construction funding was requested or appropriated.	FY 1996: Conduct non-site specific Title I/Preliminary Design, of lasers, target area, integrated computers and controls, optical assembly building and optical components, including engineering studies, preliminary drawings and preliminary cost estimates. Select architect/engineering contractor and construction management contractor. Select project site following the Record of Decision on the SSM PEIS.	FY 1997: Complete final work on Title I/Preliminary Design. Conduct Title II/Final Detailed Design, including final detailed drawings. Prepare long-lead procurement packages for laser building, target area building, beam diagnostic systems, and beam transport support structure. Begin site preparation activities prior to actual facility construction which could begin in the 1st quarter FY 1998.

FUNDING LEVELS:

$0	$37,400	$131,900

Weapons Stockpile Stewardship
Inertial Confinement Fusion

1. Title and location of project: National Ignition Facility (NIF) Site To Be Determined	2a. Project No.: 96-D-111 2b. Construction Funded

SIGNIFICANT CHANGES

- Engineering design work (i.e., advanced conceptual design) since completion of the Conceptual Design Report in FY 1994, as well as advances in inertial confinement fusion science and technology, have led to some modifications in the design of the NIF. The Title I design, scheduled for completion in the fall of 1996, will take these into consideration, as well as the design of an optics assembly and refurbishment capability that was previously considered an infrastructure requirement. The costs for these design efforts are being absorbed within the amount of funding provided in the FY 1996 appropriation.

- Site selection for the NIF will be part of the Record of Decision on the Stockpile Stewardship and Management Programmatic Environmental Impact Statement that is scheduled for late FY 1996. After site selection and upon completion of Title I, the total project costs will be reviewed and validated, including the site infrastructure costs previously footnoted.

- Conceptual design costs, beyond the original $12 million spent on the Conceptual Design Report in FY 1993 and FY 1994, are reflected in Item 11.a.2.b. for activities associated with the optics assembly and refurbishment and site infrastructure.

a/ Does not include site specific infrastructure costs.

b/ Funding requirements (BA) represent total estimated cost (TEC) of the project only. Activities included under other project costs (OPC) are explained in Item 12.a.2. and the corresponding operations and maintenance funding identified in Item 11.a.2. are essential to achieving the project scope and schedule.

1. Title and Location of Project: National Ignition Facility (NIF) Site To Be Determined (Continued)	2a. Project No. 96-D-111 2b. Construction Funded

8. Project Description, Justification and Scope

The Project provides for the design, procurement, and construction of the National Ignition Facility (NIF), an experimental inertial confinement fusion facility intended to achieve controlled thermonuclear fusion in the laboratory by imploding a small capsule containing a mixture of the hydrogen isotopes, deuterium, and tritium. If a decision is made to proceed with construction, the NIF will be constructed at a site determined by the Record of Decision in late summer of 1996 as a part of the Stockpile Stewardship and Management Programmatic Environmental Impact Statement (SSM PEIS). The DOE designated preferred site is the Lawrence Livermore National Laboratory (LLNL), Livermore, California.

The DOE is undertaking a site selection process to determine the DOE-DP host site for the NIF as part of the SSM PEIS. The current TEC includes the site, conventional and special facilities described below. The site infrastructure improvements to accommodate the NIF, such as warehousing, fire stations, cafeterias, and shops, are not included. Much of this infrastructure is expected to exist at an adequate capacity to accommodate the NIF operations at most of the proposed DOE-DP sites. Any additional estimated costs for the infrastructure required at any particular site will be provided later, following the site selection process.

The mission of the National Inertial Confinement Fusion (ICF) program is to achieve controlled thermonuclear fusion in the laboratory. This program supports the DOE mandate of maintaining nuclear weapons science expertise required for stewardship of the stockpile, testing of nuclear weapons effects, and the development of fusion power by providing a database for inertial fusion ignition. As a key element of its Stockpile Stewardship Program, the NIF is designed to achieve propagating fusion burn and modest (1-10) energy gain within 2-3 years of initial operation and to conduct high energy density experiments, both through fusion ignitions and through direct application of the high laser power. This mission was identified in the NIF Justification of Mission Need, which was endorsed by the Secretary of Energy. Identification of target ignition as the next important step in ICF development for both defense and non-defense applications is consistent with the earlier (1990) recommendation of DOE's Fusion Policy Advisory Committee, and the National Academy of Sciences Inertial Fusion Review Group. In 1995, the DOE's Inertial Confinement Fusion Advisory Committee affirmed the program's readiness for an ignition experiment. A review by the JASONs in 1996 affirmed the value of the NIF for stockpile stewardship.

The NIF project supports the DOE mandate to maintain nuclear weapons science expertise required for stewardship of the stockpile. After the United States announcement of a moratorium on underground nuclear test in 1992, the Department established the Stockpile Stewardship program to ensure the preservation of the core intellectual and technical competencies in nuclear weapons. In addition, as a means of reducing the danger posed by nuclear weapons proliferation, the President announced that the United States would pursue a true zero yield Comprehensive Test Ban Treaty (CTBT). One of the safeguards that defines the terms under which the U.S. would enter a CTBT is the conduct of the Stockpile Stewardship program to ensure the safety and reliability of the stockpile. The NIF is one of the most vital facilities in that program. The NIF will provide the capability to conduct laboratory experiments to address the high energy density and fusion aspects that are so important to both primaries and secondaries in stockpile weapons.

At present, the Nation's computational capabilities and scientific knowledge are inadequate to ascertain all of the performance and safety impacts from changes in the nuclear warhead physics packages due to aging, remanufacturing, or engineering and design alterations. Such changes are inevitable if the warheads in the stockpile are retained well into the next century, as expected. In the past, the impacts of such changes were evaluated through nuclear weapon tests. Without underground tests, we will require better, more accurate computational capabilities to assure the reliability and safety of the nuclear weapons stockpile for the indefinite future.

To achieve the required level of confidence in our predictive capability, it is essential that we have access to near-weapons conditions in laboratory experiments. The importance of nuclear weapons to our national security requires such confidence. For detonation of weapon primaries, that access is provided in part by hydrodynamic testing. For secondaries and for some aspects of primary performance, the NIF will be a principal laboratory experimental physics facility.

1. Title and Location of Project: National Ignition Facility (NIF) Site To Be Determined (Continued)	2a. Project No. 96-D-111 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The most significant potential commercial application of ICF in the long term is the generation of electric power. Consistent with the recommendations of the Fusion Policy Advisory Committee, the NIF will provide a unique capability to address critical elements of the inertial fusion energy program by exploring moderate gain (1 to 10) target designs, establishing requirements for driver energy and target illumination for high gain targets, and developing materials and technologies useful for civilian inertial fusion power reactors.

The ignition of an inertial fusion capsule in the laboratory will produce extremely high temperatures and densities in matter. Thus, the NIF will also become a unique and valuable laboratory for experiments relevant to a number of areas of basic science and technology.

The NIF is an experimental fusion facility consisting of a laser and target area, and associated assembly and refurbishment capability. The laser will be capable of providing an output pulse with an energy of 1.8 megajoules (MJ) and an output pulse power of 500 terawatts (TW) at a wavelength of 0.35 micrometers (μm) and with specified symmetry, beam balance and pulse shape. The NIF design calls for an experimental facility to house a multibeam line, neodymium (Nd) glass laser capable of generating and delivering the pulses to a target chamber. In the target chamber, a positioner would center a target containing fusion fuel, a deuterium-tritium mixture, for each experiment. Diagnostics provided by this project would provide the test data to demonstrate subsystem performance and initial operations.

The NIF experimental facility, titled the Laser and Target Area Building, would provide an optically stable and clean environment. This laser building would be shielded for radiation confinement around the target chamber and will be designed as a nonnuclear, low -hazard facility capable of withstanding the natural phenomena specified for the host site. The baseline facility is for one target chamber, but the design shall not preclude future upgrade for additional target chambers.

The NIF project consists of conventional and special facilities. Special facilities include the Laser System, Target Area, Integrated Computer Control System, and Optics.

Site and Conventional Facilities include the land improvements (e.g., grading, roads) and utilities (electricity of 58,000 megawatt-hours per year, heating gas at 40,900,000 megajoules per year or equivalent, water at 25,600,000 liters per year). The laser building has an approximately 16,000 square meters footprint, and 25,000 square meters in total area. It is a reinforced concrete and structural steel building that provides the vibration-free, shielded, and clean space for the installation of the laser, target area, and integrated control system. The laser building consists of two laser bays, each 24 meters (m) by 130 m long, and a central target area--a heavily shielded (1.8 m thick concrete) cylinder 30 m in diameter and 29 m high. The laser building includes security systems, radioactive confinement and shielding, control rooms, supporting utilities, fire protection, monitoring, and decontamination and waste handling areas. An optics assembly and refurbishment capability is required regardless of site; therefore, the design of this functionality is added to the scope of the project.

Special Facilities:

- The laser system will be designed to generate and deliver high power optical pulses to the target chamber. The system consists of 192 laser beamlets configured to illuminate the target surface with a specified symmetry, uniformity, and temporal pulse shape. The laser pulse originates in the pulse generation system. This precisely formatted low energy pulse is amplified in the main amplifier. To minimize intensity fluctuation, each beam is passed through a pinhole in a spatial filter on each of the four passes through the amplifier and through a transport spatial filter. The beam transport directs each high power laser beam to an array of ports distributed around the target chamber where the frequency of the laser light is tripled to 0.35 μm, spatially modulated by phase plates and focused on the target. Systems are provided for automatic control of alignment and the measurement of the power and energy of the beam. Structural support and auxiliary systems provide the stable platform and utilities required.

177

1. Title and Location of Project: National Ignition Facility (NIF) Site To Be Determined (Continued)	2a. Project No. 96-D-111 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

- The target area includes a 10 m diameter, low activation (i.e., activated from radiation) aluminum vacuum chamber located in the Target Area of the laser building. Within this chamber, the target will be precisely located. The chamber and building structure provide confinement of radioactivity (e.g., x-rays, neutrons, tritium, and activation products). Diagnostics will be arranged around the chamber to demonstrate subsystem performance for project acceptance (TEC) and initial operations (TPC). Structural, utility and other support systems necessary for safe operation and maintenance will also be provided in the Target Area. The target chamber and staging areas will be capable of conducting experiments with cryogenic targets. The Experimental Plan indicates that cryogenic target experiments for ignition will be needed 2-3 years after completion of the project. Therefore, the targets and this cryogenic capability will be supplied by the experiments. The NIF project will make mechanical and electrical provisions necessary to position and align the cryogenic targets within the chamber. The baseline is for indirectly driven targets. An option for directly driven targets will be considered in the design.

- The integrated computer control system includes the computer systems (note: no individual computer will cost over $100,000) required to control the laser and target systems. The system will provide the hardware and software necessary to support NIF operations. Also included is an integrated timing system for experimental control of laser and diagnostic operations. Safety interlocks and access control will also be provided.

- Thousands of optical components would be required for the 192 beamlet NIF. These components include laser glass lenses, mirrors, polarizers, deuterated potassium dihydrogen phosphate crystals, pulse generation optics, debris shields and windows, and the required optics coatings. Optics includes quality control equipment to receive, inspect, characterize, and refurbish the optical elements.

1. Title and Location of Project: National Ignition Facility (NIF) Site To Be Determined (Continued)	2a. Project No. 96-D-111 2b. Construction Funded

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 153,600
1. Engineering, design and inspection at approximately 16.6 percent of construction costs (Item c)	$ 90,400	
2. Construction management at approximately 2.2 percent of construction costs (Item c)	12,100	
3. Project management at approximately 9.4 percent of construction costs (Item c)	51,100	
b. Land and land rights		0
c. Construction costs		544,400
1. Improvements to land	1,800	
2. Buildings modification	106,400	
3. Site-specific infrastructure	TBD c/	
4. Other Structures	0	
5. Utilities	6,300	
6. Special Facilities	429,900	
d. Standard equipment		700
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		$ 698,700
i. Contingencies of approximately 20.6 percent of above costs		143,900
j. Total line item cost (Section 11.a.1.(a)		$ 842,600 d/
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 842,600

The cost estimate assumes a project organization and cost distribution consistent with the management requirements appropriate for a DOE Strategic System as outlined in the DOE Order 430.1, Life Cycle Asset Management and the NIF Project Execution Plan. Actual cost distribution will be in conformance with accounting guidelines in place at the time of project execution.

10. Method of Performance

Method of performance will vary slightly with the site selected by the DOE. However, the main approach will be that the NIF Laboratory Project Office (consisting of LLNL, LANL, SNL, and UR/LLE and supported by competitively-selected contracts with Architect Engineering firms, a Construction Manager, equipment and material vendors, and construction firms) will prepare the design, procure equipment and materials, and perform conventional construction, safety, system analysis, test, and operations. DOE will maintain oversight and coordination through the Headquarters Office of the National Ignition Facility and the field office. DOE will conduct the site selection and the NEPA determination. LLNL has been designated as the preferred site. The procurement and installation/test of special equipment will be performed by the NIF Laboratory Project Office. Inspection and Title III engineering contracts for the conventional systems will be competitively awarded. NIF start-up will be conducted by the NIF laboratory operations staff.

---

c/ Site-specific infrastructure costs will be determined after site selection. (For the LLNL site, the infrastructure costs have been estimated by LLNL to be about $26 million.)

d/ Based on 100 percent conceptual design completion.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1996	FY 1997	FY 1998	Outyears	Total
a. Total project costs						
1. Total facility costs						
(a) Line item (Section 9.j.)	$ 0	$ 33,400	$ 49,500	$ 180,700	$ 579,000	$ 842,600
(b) Plant, Engineering and Design (PE&D)	0	0	0	0	0	0
(c) Operating expense funded equipment	0	0	0	0	0	0
(d) Inventories	0	0	0	0	0	0
Total facility costs (Federal and Non-Federal)	$ 0	$ 33,400	$ 49,500	$ 180,700	$ 579,000	$ 842,600
2. Other project costs						
(a) R&D necessary to complete construction	$ 0	$ 8,800	$ 43,900	$ 38 400	$ 17,400	$ 108,500
(b) Conceptual design costs	$ 12,000	250	150	0	0	12,400
(c) Decontamination and Decommissioning (D&D)	0	0	0	0	0	0
(d) NEPA documentation costs	2,100	1,200	500	600	1,200	5,600
(e) Other project related costs	4,100	7,950	4,650	4,800	83,000	104,500
(f) Total other project costs	$ 18,200	$ 18,200	$ 49,200	$ 43,800	$ 101,600	$ 231,000
(g) Total project cost	$ 18,200	$ 51,600	$ 98,700	$ 224,500	$ 680,600	$1,073,600
(h) LESS: Non-Federal contribution	$ 0	$ 0	$ 0	$ 0	$ 0	$ 0
(i) Net Federal total project (TPC)	$ 18,200	$ 51,600	$ 98,700	$ 224,500	$ 680,600	$1,073,600
Note: BA requirements TEC e/	$ 0	$ 37,400	$ 131,900	$ 197,800	$ 475,500	$ 842,600
OPC f/	$ 18,200	$ 23,600	$ 59,200	$ 31,300	$ 98,700	$ 231,000

b. Related annual costs (estimated life of project--30 years)	
1. Facility operating costs	$ 22,200
2. Facility maintenance and repair costs	31,800
3. Programmatic operating expenses directly related to the facility	55,000 g/
4. Capital equipment not related to construction, but related to the programmatic effort in the facility	200
5. GPP or other construction related to programmatic effort in the facility	200
6. Utility costs	2,300
7. Other costs	4,000
Total related annual funding	$115,700

e/ Specific long-lead procurements and contracts (e.g., building construction; major laser, optics, and target area special equipment) require BA in advance of BO.

f/ Specific long-lead procurements and contracts (e.g., optics facilitization and pilot production) require BA in advance of BO.

g/ This primary experimental operating expense will be included in the base Inertial Confinement Fusion Program budget.

1. Title and Location of Project: National Ignition Facility (NIF) Site To Be Determined (Continued)	2a. Project No. 96-D-111 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project costs

1. Total facility costs
   (a) Line item -- Narrative not required.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- None.
   (d) Inventories -- None.

2. Other project costs
   (a) R&D necessary to complete construction -- Costs include optics vendor facilitization ($60,300), pilot production (e.g., optics components) ($20,900), component production prototyping ($6,900), target diagnostics ($12,500) not required to determine project subsystem performance for project acceptance, and pilot optics Quality Assurance ($7,900).
   (b) Conceptual design and engineering studies -- Includes the original conceptual design report completed in FY 1996 ($12,000) and the conceptual design activities for the optical assembly and refurbishment capability and site infrastructure ($400).
   (c) Decontamination and decommissioning (D&D) -- None.
   (d) NEPA documentation -- Preparation includes the NIF portion of the Stockpile Stewardship and Management Programmatic Environmental Impact Statement ($3,200), environmental monitoring and permits ($2,400).
   (e) Other project related costs -- Engineering studies (including advanced conceptual design) of project options ($6,950); assurances, safety analysis, and integration ($13,150); start-up planning, management, training, and staffing ($10,400); procedure preparation ($4,200); operating spares ($12,800); costs incurred during construction, installation, component and systems test and checkout prior to Operational Readiness Review (ORR), electricity ($5,600), start-up ($35,300), argon, nitrogen, and building maintenance ($14,100); and ORR ($2,000).

b. Related annual costs

1. Facility operating costs -- Includes operator labor, engineering support and materials for upgrades and modifications, and consumables for operation of special equipment.
2. Facility maintenance and repair costs -- Includes cost of labor, engineering support, and consumables for special equipment maintenance and refurbishment, including optics. Also includes maintenance for the laser building and support buildings.
3. The current NOVA experimental program, including LLNL, LANL, SNL, and General Atomics, is approximately $37,000. Based on use of complex cryogenic targets, increased diagnostics support, and higher levels of three dimensional physics modeling, the direct NIF experimental program costs are estimated at $55,000. Additional program costs will be associated with use of the facility.
4. Fabrication accounts, procurements, such as small lasers and some laser parts, Computer-Aided Design systems, etc. to support upgrades.
5. Minor additions and modifications to the facility related to programmatic effort.
6. Electricity only. Gas, sewer, water, etc. are paid out of overhead included in labor rate tables.
7. Nitrogen and argon for laser and transport beam tubes, stock inventory, and procurement support.

WEAPONS STOCKPILE STEWARDSHIP
TECHNOLOGY TRANSFER AND EDUCATION

NOTE: Summary level funding information is included in the Weapons Stockpile Stewardship overview

TECHNOLOGY TRANSFER: Technology Transfer operations and maintenance supports cooperative activities between the nuclear weapons complex and the private sector which provide dual benefits to the nuclear weapons program and U.S. industry. The majority of the activities are partnerships called Cooperative Research and Development Agreements (CRADAs) which have been selected on the basis of their contribution to the advanced technology needs of the weapons complex, principally at the nuclear weapons laboratories and the weapons production plants at Oak Ridge and Kansas City. These technology partnerships are strongly supportive of two new Defense Programs Initiatives - the Accelerated Strategic Computing Initiative (ASCI) and the Advanced Design and Production Technologies Initiative (ADAPT) - and other Core Weapons Research and Development objectives.

PROGRAM GOALS:

- Support the goals and initiatives of the Stockpile Stewardship and Management programs, particularly in the areas of advanced computing and manufacturing.
- Advance a broad range of critical weapons core competencies and programs.
- Continue industry partnerships, leveraging the vast resources of the private sector to cost share the development of the best, most efficient and most affordable technologies needed to meet the objectives of the Stockpile Stewardship and Management programs.
- Support the Small Business Initiative, providing technology assistance and partnership agreements for businesses of less than 500 employees.

ONGOING RESPONSIBILITIES:

Funds will be distributed to the laboratories and weapons production facilities in accordance with their approved plans for completion of existing cooperative research and development projects. The reduced funding will be applied to the projects deemed by the facility to be the most important to its mission-related competencies. The primary emphasis will be on those which support advanced computing and advanced manufacturing. In addition, the Small Business Initiative will be continued at a reduced level.

CHANGE FROM FY 1996: The FY 1997 funding level, a reduction of $99.6 million from FY 1996, reflects the accelerated transition which was initiated in FY 1995, and will primarily support agreements related to the ASCI and ADAPT Initiatives.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995	FY 1996	FY 1997
Plan for the transition of the technology transfer program to support key stockpile stewardship initiatives. Supported the laboratory/facility partnerships and major partnerships with high value to the Stockpile Stewardship and Management programs and significant U.S. economic impact. Results include: - National Storage Laboratory: Produced high performance storage software that will be used by ASCI to meet its extremely challenging archival storage requirements. - Nuclear Well Logging: Included radiation transport modeling which added 3D physics and visualization to Monte Carlo Neutron Transport codes at Los Alamos which will be part of the ASCI portfolio of applications codes. - Neural networks/Process control: developed and deployed to adaptive control system for a major chemical manufacturer which will also fulfill critical ADAPT requirements for advanced process control. - Mesh Generation Consortium: implemented advanced 3D analytical models to be used in commercial and ADAPT engineering software. - Technologies Enabling Agile Manufacturing (TEAM) program: completed and demonstrated a number of software modules for computer aided manufacturing and inspection process automation. Supported the Small Business and National Tool Initiatives.	Continue the transition to direct support of fundamental stockpile stewardship needs. Continue the highest priority, previously approved projects, thus honoring commitments with industry and permitting the laboratories to complete planned R&D objectives. Terminate the lowest priority (bottom 10-15%) projects. Reduce scope and funding of remaining projects (approximately 50% of projects) to ensure funding for highest priorities while providing some support to commitments made to industrial partners and key competency areas of the laboratories. Continue to support the Small Business and National Machine Tool Initiatives but at reduced levels.	Complete the transition of the technology transfer program to support the Stockpile Stewardship and Management objectives, particularly advanced computing and advanced manufacturing. Support the Small Business Initiative at reduced levels.

FUNDING LEVELS:

$213,554	$149,000	$49,400

EDUCATION: The Education program supported by Stockpile Stewardship provides funding for math and science educational programs through the Albuquerque, Oakland, and Nevada Operations Offices to the Lawrence Livermore National Laboratory, Los Alamos National Laboratory, and Sandia National Laboratories. These programs allow use of the unique resources of the Department of Energy national laboratories -- people, programs, and facilities -- to improve science and math education throughout the Nation. Enhancing the scientific education of our citizens will ensure a highly trained, diverse scientific workforce for the laboratories and will ultimately enhance our ability to conduct the Stockpile Stewardship mission. The projects supported by the laboratories may be ongoing in nature or may be for a defined period, and are grouped in six major categories: teacher/faculty enhancement, curriculum improvement, institutional improvement, student support, educational technology and public understanding of science. The laboratories annually submit a proposed list of projects to Defense Programs Headquarters for approval. Each laboratory publishes an annual report depicting the science education projects conducted and their accomplishments. Of the total budget each year, approximately 15 percent is provided through the laboratories to enhance math and science education at Historically Black Colleges and Universities and other minority institutions.

PROGRAM GOALS:

- Contribute to systemic improvement in science, mathematics, engineering and technology education.

- Ensure a highly trained, diverse workforce.

- Enhance scientific and technical literacy.

CHANGES FROM FY 1996:

With a 50 percent reduction in the science education program from FY 1995 to FY 1996, all projects and funding status were evaluated and the science education program reprioritized in order to support the projects with direct bearing on the mission of Defense Programs. This refocusing process will be completed in FY 1997. The program will continue at the same level of effort in FY 1997; however, emphasis will be placed on graduate and post-graduate activities that have a direct tie to the Defense Programs' mission and goals and the core competencies of the laboratories.

Weapons Stockpile Stewardship
Technology Transfer & Education
Education (Continued)

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
Conducted a total of 100 math, science and engineering education programs for teacher and student participants at all educational levels. Supported initiatives for Historically Black Colleges and Universities/Minority Institutions to increase the participation of historically underrepresented groups in scientific and technical fields. Examples of successful projects included: - the 1994-95 New Mexico High School Supercomputing Challenge; - a project to help schools implement new technologies into the educational process; - a collaboration with the New Mexico State Systemic Initiative in Math and Science. - development of a curriculum guide for conducting scientific research projects in K-12 classrooms; - a national program to encourage junior and senior high school girls to develop and maintain an interest in science and scientific careers; - a CD ROM containing images from the deep space Clementine satellite and corresponding lesson material; - a program to develop accredited technical degree programs for underrepresented groups which resulted in 41 graduates in FY 1995.	Emphasize programs for high school, undergraduate and graduate level participants with a priority on programs that have a direct connection to the core competencies of the laboratory. Emphasize collaborative research projects to leverage available resources in areas such as advanced computing. Develop a curriculum module on radiation and risk assessment using laboratory experts in conjunction with local master teachers.	Ensure a well-balanced mix of projects which are tied directly to the Department of Energy Defense Programs' mission and goals as well as the laboratories core competencies. Provide students and their teachers with opportunities to collaborate with Laboratory scientists as an outgrowth of the National Ignition Facility for Teachers and Youth (NIFTY) curriculum development effort. The Global Security high school curriculum developed by laboratory scientists in conjunction with master teachers will be disseminated nationwide. The curriculum will include advanced visualization tools for atmospheric modeling developed at the Atmospheric Release Advisory Center.

FUNDING LEVELS:

$20,000	$10,000	$10,000

WEAPONS STOCKPILE MANAGEMENT

PROGRAM MISSION

The Weapons Stockpile Management Program was established to provide for surety, reliability, maintenance, refurbishment as necessary, evaluation, dismantlement, transportation, and disposal of nuclear weapons in accordance with quality, quantity, and schedule requirements approved by the President in the Nuclear Weapons Stockpile Plan (NWSP), and to consolidate the nonnuclear weapons manufacturing activities as needed to develop and maintain key technologies necessary to support the enduring stockpile.

GOAL:
The goal of the program is to support the national security of the United States by maintaining a safe, reliable nuclear deterrent. The objectives related to the goal of the Weapon Stockpile Management Program are to:
- provide the capability to maintain, evaluate, repair, or replace weapons in the existing stockpile, dismantle retired weapons, as required, and upgrade enduring stockpile weapons with enhanced weapon safety, security, or use control features;
- assure the safety, security, and reliability of stockpiled weapons, and assure that weapons meet the specified military characteristics;
- dismantle excess nuclear weapons in accordance with national policy and international agreements, and provide safe, secure, and verifiable processing and storage or disposition of the resulting nuclear materials and components;
- continue an effective Radiological/Nuclear Accident Response Program by providing the capability to respond to nuclear accidents/incidents and other evolving nuclear terrorist threats;
- continue to reconfigure the infrastructure to meet the requirements for management of nuclear weapons manufacturing technology and safe/secure storage of strategic nuclear materials by making the infrastructure smaller, cost effective, responsive, flexible, agile, and environmentally responsible; and
- assure the availability of adequate supplies of tritium to meet the requirements of the enduring stockpile by continuing work on an assured source of Tritium.

During **FY 1995**, the following significant accomplishments were realized.

- reduced the backlog of retired weapons by dismantling 1,393 warheads.
- assured adequate level of testing for evaluation of all weapons in the enduring stockpile.
- issued a draft Programmatic Environmental Impact Statement for Tritium Supply and Recycling for public review and comment.
- maintained warheads through a robust surveillance program that detected deficiencies in the stockpile through destructive and nondestructive testing.
- maintained the nuclear weapons stockpile as depicted in the FY1996-2001 Nuclear Weapons Stockpile Plan, awaiting the President's signature, by supporting Limited Life Component Exchange (LLCE) schedules. Delivered LLCE "kits" to the Department of Defense to support the enduring stockpile.
- developed and implemented a training and certification program for Department of Energy Nuclear Explosive Safety Study Group members and reviewers.
- implemented Seamless Safety-21 at Pantex Plant using a graded approach for the W55 and W79, and full application for all other weapons starting with the B61.
- maintained stockpile surety, improved current assessment capabilities, improved surety processes and methodologies, and increased surety assessment effectiveness.
- supported the development of the pit rebuild capability program.
- activities to support the replacement of the B53 strategic bomb;
- activities to support the W87 Life Extension Program.

PROGRAM MISSION - STOCKPILE MANAGEMENT (Continued)

The Tritium Supply and Recycling Programmatic Environmental Impact Statement (PEIS) was completed in October 1995 and the formal Record of Decision supporting a dual-track strategy was announced on December 6, 1995. Over the next three years, the Department will pursue the two most promising tritium supply alternatives. One track will explore the purchase of an operating or partially complete commercial light-water reactor or the purchase of irradiation services from such a reactor. The second track will be to design, build, and test critical components of an accelerator system for production of tritium and prepare a design for the actual facility. The Department will select one of the alternatives at a later date to serve as the primary source of tritium for the nuclear weapons stockpile. The other alternative would be developed as a back-up source.

The FY 1996 and FY 1997 programs will continue ongoing activities required to manage the stockpile, such as adherence to the current Stockpile Plan, related dismantlement, and LLCE schedules. The following new initiatives are scheduled for **FY 1996**

- development and application of Acorn reservoir technology to the appropriate stockpiled weapons;
- upgrade of the B83-1 strategic bomb;
- dismantlement of approximately 1,100 warheads;
- issuance of the final Tritium Supply and Recycling PEIS in October 1995 and the Secretarial Record of Decision in December 1995;
- initiation of the dual-track strategy for a new, assured tritium source;
- selection of a prime engineering contractor to support the APT track of the dual-track tritium strategy;
- issuance of both the draft and final Stockpile Stewardship and Management PEIS and the Secretarial Record of Decision; and
- initiation of activities in support of the Enhanced Surveillance Program;
- initiation of the W76 Dual Revalidation Program.

In addition to continuing to support the activities initiated in FY 1996, initiatives for **FY 1997** are:

- begin full production of the Safeguards Transporter;
- fully fund the Defense Programs pension and sales tax liabilities at Mound and Pinellas;
- sponsor and participate in the DOE Lead Federal Agency Weapons Accident exercise;
- issue the LANL and Pantex Site-wide EISs;
- dismantle approximately 1,300 warheads;
- provide funding for one-half of the activities of the National Resource Center for Plutonium in Amarillo, Texas

Funding of $5 million is requested in FY 1997 to fund one-half of the activities of the National Resource Center for Plutonium (PRC) in Amarillo, Texas. PRC serves as a scientific and technical information resource on issues relating to the storage, disposition, potential utilization, and transportation of plutonium, high explosives, and other hazardous materials generated from weapons assembly and disassembly operations. PRC is available to respond to needs for information and interpretation of technical and scientific data raised by interested and concerned citizens, oversight agencies of Federal, State, and local governments, elected officials, and site-specific groups. PRC was established in FY 1995 and was fully funded by the Office of Fissile Materials Disposition in FY 1995 ($9 million) and FY 1996 ($10 million). The Office of Fissile Materials Disposition will also budget for $5 million in FY 1997 for the National Resource Center for Plutonium which will provide PRC a total of $10 million in FY 1997.

PERFORMANCE MEASURES:
Specific performance measures are included int he program element descriptions on the following pages. Significant overall measures for FY 1997 are:
-First Life Extension Program Underway
-Dismantle About 1,300-1,400 Weapons

PROGRAM MISSION - STOCKPILE MANAGEMENT (Continued)

-Full Implementation of Enhanced Surveillance Program
-Dual Track Strategy for Tritium

FACILITY OPERATIONS:

STOCKPILE MANAGEMENT SITES: Weapons Stockpile Management activities are conducted at four production facilities and three national laboratories. The production facilities include Allied Signal Aerospace - Kansas City Plant, Missouri; Mason & Hanger - Pantex Plant, Texas; Lockheed Martin Energy Systems, - Y-12 Plant, Tennessee; and Westinghouse Savannah River Company - Tritium Site, South Carolina. The national laboratories include Sandia National Laboratories and Los Alamos National Laboratory, New Mexico, and Lawrence Livermore National Laboratory, California. Other miscellaneous locations are funded through the Weapons Stockpile Management Program as noted on the funding by location table included in the Weapons Activities Executive Summary.

The nuclear weapons complex is expected to experience ongoing consolidation over the next 5 to 10 years. The goal of the consolidation effort is to design a complex that is smaller, more flexible, and much less expensive to operate. By the year 2001, nonnuclear manufacturing and processing capabilities will be consolidated at the Kansas City Plant, the Savannah River Site, the Los Alamos National Laboratory (LANL), and Sandia National Laboratories (SNL).

Three important Environmental Impact Statements (EIS) are currently underway within the Department that will assist in defining alternatives that will lead to a consolidated nuclear weapons complex in the twenty-first century: 1) a Stockpile Stewardship and Management PEIS to be completed July 1996; 2) a Pantex Site-wide Environmental Impact Statement (SWEIS) to be completed by November 1996; and 3) a LANL SWEIS to be completed by the summer of 1997.

CONCEPTUAL DESIGN REPORTS AND POST-CONCEPTUAL DESIGN ENGINEERING: During the budget request period, there are two Conceptual Design Reports (CDR) for new construction activities which will exceed $3 million. The Department is planning to initiate both of these CDR's in FY 1996 pending formal Congressional notification. The first will support the APT track of the dual-track strategy for a new tritium source. The estimated cost of the conceptual design effort is $74 million. The second conceptual design will support the Stockpile Stewardship and Management (SS&M) Programmatic Environmental Impact Statement. The Department is currently developing a preferred alternative which will identify capabilities and facilities for the SS&M programs and will determine a configuration for implementation of the SS&M programs. Conceptual design and other pre-title I activities are expected to be carried out in FY 1996 and FY 1997 at an estimated cost of approximately $12 million.

CAPITAL EQUIPMENT AND GENERAL PLANT PROJECTS: The merger of capital equipment and general plant projects funding with operating expense funding in FY 1996 will afford the plants and laboratories more flexibility in carrying out the Stockpile Management program.

FY 1997 BUDGET STRUCTURE:

Comparabilities:

Due to the realignment of some of the budget elements within Weapons Activities affecting the Stockpile Management Program, the FY 1997 budget is presented on a comparable basis versus the traditional method of non-comparable. This change provides the benefit of allowing the FY 1997 column of the budget narrative (program activities and resource requirements) to reference changes from FY 1996 on a comparable basis. Since the budget request format does not show funding in the structure where it was appropriated, Tables 1 and 2 provide crosswalk matrices for FY 1995 and FY 1996 to allow visibility into the development of comparabilities for these years.

The more significant changes that have occurred are:

1. Core Stockpile Management - All salaries, benefits and related costs, including support services contracts, for Federal employees have been transferred to the Weapons Activities

PROGRAM MISSION - STOCKPILE MANAGEMENT (Continued)

Program Direction decision unit. Due to this transfer, the Federal Support key activity has been renamed. The new name is Special Projects and Other which will include the activities and resources not transferred to Program Direction. Budget data and activity descriptions also reflect the transfer out of the Rocky Flats Plant surveillance activities to the Materials Surveillance Subprogram within Stockpile Management. Dose Reconstruction activities will be funded in FY 1997 and beyond by the Assistant Secretary for Environment, Safety and Health. Therefore, FY 1995 and FY 1996 are adjusted accordingly.

2. Materials Surveillance - All salaries, benefits and related costs, including support services contracts, for Federal employees have been transferred to the Weapons Activities Program Direction decision unit. Due to this transfer and the nature of activities transferred, the name of this Subprogram has been changed from Materials Surveillance and Technical Support to Materials Surveillance. Budget data and activity description also reflect the transfer in of the Rocky Flats Plant surveillance activities to the Materials Surveillance Subprogram within Stockpile Management.

Stockpile Management - Subprograms:

The Weapons Stockpile Management budget request is presented within five subprograms:

Core Stockpile Management: This program includes lifetime surety, maintenance, surveillance, evaluation, repair, and reliability of the enduring stockpile; weapons dismantlement and disposal; maintenance of a production capability; development and operation of safe, secure systems for transporting nuclear weapons and components; enhanced surveillance activities to extend capability to determine, in advance, what components are likely to fail; and operation of a complex that meets environment, safety, and health requirements.

Radiological/Nuclear Accident Response: This program ensures the maintenance of the Department's technical and operational capabilities for responding to radiological accidents/incidents or malevolent nuclear incidents worldwide. Radiological/Nuclear Accident Response assets include the Nuclear Emergency Search Team, Federal Radiological Monitoring and Assessment Center, Aerial Measuring System, Atmospheric Release Advisory Capability, Accident Response Group, Radiological Assistance Program, and Radiation Emergency Assistance Center/Training Site.

Reconfiguration: This program has been significantly downsized in scope since its inception. The focus for FY 1997 will be to continue consolidation of nonnuclear manufacturing efforts within the weapons complex, including the transfer of 25 technologies and processes and the requalification of these technologies and processes at various receiver sites.

Tritium Source: This program will support the implementation of the Secretarial Record of Decision on tritium production and recycle facilities to provide tritium for the Nation's enduring nuclear weapons stockpile.

Materials Surveillance: This program (formerly named Materials Surveillance and Technical Support) supports materials surveillance activities (safeguards and security) at former DP facilities (Rocky Flats, Hanford, Fernald, Savannah River, and Idaho National Engineering Laboratory) that have been transferred to Environmental Management.

Dose Reconstruction Activities will be funded in FY 1997 and beyond by the Assistant Secretary for Environment, Safety and Health.

The Core Stockpile Management operating program includes procurement of materials (exclusive of nuclear materials); fabrication and assembly of nuclear weapons and weapon components, lifetime surety, maintenance and reliability assessments of the enduring stockpile, weapon dismantlement and disposal, maintenance of a production capability, development and operation of safe, secure systems for transporting nuclear weapons and weapon components, preparation, issuance, and maintenance of field training manuals, and facility startup and standby operations.

PROGRAM GOALS:
- Fully support the warhead dismantlement/disposal and storage program
- Increase support for retrofit programs for the B61, W76, B83, W87, and B53 replacement
- Support the limited life component exchange program
- Provide quality evaluations, special testing, and surveillance of nuclear weapon systems
- Acquire a pit rebuild capability program
- Maintain essential technologies and capabilities for which there is no current workload scheduled
- Initiate the Enhanced Surveillance Program
- Maintain the weapons complex infrastructure at a level necessary to accomplish mission requirements
- Initiate the W76 dual revalidation program

CHANGE FROM FY 1996:
Overall the FY 1997 program funding for Core Stockpile Management is level with FY 1996. However, it is noted there is increased funding (1) (+$29.0 million) for the pension and sales tax liabilities at the Mound and Pinellas Plants, (2) (+$10.0 million) for the new Safeguards Transporter production activities, and (3) (+$21.1 million) for the Enhanced Surveillance Program. These increases are offset by the FY 1996 Congressional nonrecurring increase of $81million in this program element for maintaining infrastructure and capabilities.

MEASURABLE PERFORMANCE ACTIVITIES (Summary of Program Category Pages):

FY 1995:	FY 1996:	FY 1997:
- Fully supported all directive schedules - Initiated B53 Replacement program actvities - Supported W87 Life Extension Programs activities - Supported development of the pit rebuild capability program - Developed draft Enhanced Surveillance Plan - Supported development of the Safeguards Transporter (SGT) - Implemented Seamless Safety-21 at Pantex	- Fully support all directive schedules - Support development, preproduction and prototyping of the new Safeguards Transporter (SGT) - Initiate production activities to support the B53 Replacement Program - Continue support of the W87 Life Extension Program - Upgrade the B83-1 strategic bomb - Develop/apply Acorn technology to stockpiled weapons - Partial funding of the DP pension and sales tax liabilities at Mound and Pinellas plants ($10M) - Initiate the Enhanced Surveillance Program (ESP) - Initiate the W76 dual revalidation program	- Fully support all directive schedules. - Support the production of the new Safeguards Transporter (SGT) - Continue activities to support the Enhanced Surveillance Program - Fund DP pension and sales tax liabilities at Mound and Pinellas plants ($39M) - Issue the LANL and Pantex Site-wide EIS - Continue production activities to support the B53 Replacement and W87 Life Extension programs - Continue the W76 dual revalidation program

Core Stockpile Management - Direct Mission and Infrastructure Programs Summary

	FY 1996 (Continued) - Core Stockpile Management - Continue support for the B61, W76, and B83 retrofit programs	FY 1997 (Continued) - Core Stockpile Management - Continue the development/application of Acorn technology to stockpiled weapons - Continue support for the upgrade of the B83-1 bomb

WEAPONS PROGRAM: The Weapons Program includes the direct activities necessary to meet all directive schedules for Stockpile Maintenance, Stockpile Evaluation, and Dismantlement. Stockpile Maintenance efforts include limited life component exchange, maintenance, and retrofit activities on various weapon systems in the enduring stockpile. Stockpile Evaluation activities include new material laboratory tests, new material flight tests, stockpile laboratory tests, stockpile flight tests, quality evaluations, special testing, and surveillance of weapon systems. Dismantlement includes all activities for weapons associated with retirement, disassembly, component characterization, and disposal and reclamation of materials and components, the engineering, development, testing, certification, procurement, and refurbishment of containers required for interim storage, and the staging and storage of weapons, components, and materials awaiting dismantlement.

CHANGE FROM FY 1996:
FY 1997 overall program increase is due to inflation and requirements to support the W87 Life Extension Program, increased stockpile evaluation activities at Pantex, and the acquistion of the pit rebuild capability program at LANL. A decrease in the dismantlement program will occur in FY 1997 due to planned facility safety and security upgrades at Pantex and because of the reduced weapon system types remaining in the dismantlement backlog.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Stockpile Maintenance activities: $65.8M - All directive schedules are fully supported; major efforts include the B61 ALT 335 and ALT 339, B83 ALT 750, W76 ALT 317 - Stockpile maintenance and limited life component (LLC) exchange activities - Initiated B53 Replacement and continued support of the W87 Life Extension Program activities - Upgraded the B83 strategic bomb - Stockpile Evaluation activities: $58.7M - Supported all directive schedules for stockpile evaluation activities - Supported activities to develop and demonstrate technologies/capabilities of a pit rebuild program at LANL	- Stockpile Maintenance activities: $82.5M - All directive schedules are fully supported; major efforts include the B61 ALT 335 and ALT 339, B83 ALT 750, W76 ALT 317 - Stockpile maintenance and limited life component (LLC) exchange activities - Continue B53 Replacement and W87 Life Extension Program activities - Continue to upgrade the B83 strategic bomb - Stockpile Evaluation activities: $61.1M - Supports all directive schedules for stockpile evaluation activities - Continue to support the pit rebuild technology/capability program at LANL - Initiate reservoir testing at Savannah River - Inititate the W76 dual revalidation program	- Stockpile Maintenance activities: $83.5M - All directive schedules are fully supported; major efforts include the B61 ALT 335 and ALT 339, B83 ALT 750, W76 ALT 317 - Stockpile maintenance and limited life component (LLC) exchange activities - Continue B53 Replacement and W87 Life Extension Program activities - Continue to upgrade the B83 strategic bomb - Stockpile Evaluation activities: $68.1M - Support all directive schedules for stockpile evaluation activities - Continue to support the pit rebuild technology/capability program at LANL - Continue the W76 dual revalidation program

202

FY 1995 Continued - Weapons Program	FY 1996 Continued - Weapons Program	FY 1997 Continued - Weapons Program
- Dismantlement activities: $57.1M - Dismantled 1,393 warheads at Pantex - Continued support for the development, testing, certification, procurement, and refurbishing of containers (including AT-400A) - Continued support for staging and storage of weapons, components, and materials awaiting dismantlement	- Dismantlement activities: $66.4M - Dismantlement of approximately 1,100 warheads at Pantex - Continue support for the development, testing, certification, procurement, and refurbishing of containers (including AT-400A) - Continue support for staging and storage of weapons, components, and materials awaiting dismantlement - Disassembly of canned subassemblies (CSAs) at the Y-12 Plant	- Dismantlement activities: $61.1M - Dismantlement of approximately 1,300 warheads at Pantex - Continue support for the development, testing, certification, procurement, and refurbishing of containers (including AT-400A) - Continue support for staging and storage of weapons, components, and materials awaiting dismantlement - Continue disassembly of canned subassemblies (CSAs) at theY-12 Plant

FUNDING LEVELS:

$181,550	$209,950	$212,660

ENHANCED SURVEILLANCE: The enduring, aging nuclear weapons stockpile will be smaller, less diverse and more vulnerable to single-point and common-mode failures. Therefore, new surveillance technologies, coupled with enhanced capabilities to predict the effects of materials aging on components and weapons performance are needed. The enhanced surveillance program (new initiative) will add to the current stockpile evaluation program predictive capabilities. Enhanced surveillance techniques will extend capabilities to determine, in advance, what components are liable to fail (and an estimate of when in their service life) and will support the establishment of a proactive stockpile life extension program. The basic goal of enhanced surveillance is to anticipate defects that might occur in the enduring stockpile due to aging or for any other reason, such as environmental exposure, to develop enhanced means to assess safety and reliability impacts and ensure that stockpile problems are corrected before they reduce safety or reliability. This program will draw from and build upon activities currently existing across the spectrum of Defense Programs research and development, testing (non-nuclear), and current stockpile evaluation/surveillance activities and will develop new predictive models, techniques for data analysis, and may eventually lead to instrumentation to monitor warheads in situ, real-time, non-destructively.

A draft Enhanced Surveillance Program Plan was prepared in May 1995 and has been updated based upon final congressional action for FY 1996 and recommendations submitted by the steering group. Enhanced Surveillance funding will support a joint laboratory and plant program in the second half of FY 1996..

CHANGE FROM FY 1996:

The increase in FY 1997 funding will allow planned objectives (even with the delayed start in FY 1996) for FY 1996 and FY 1997 to be accomplished. The total program funding level for FY 1996 is planned at $28,860 which includes $18,872 new budget authority and $9,988 in prior year uncosted balances. The funding for both years is shared by the weapons plants and the laboratories.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
	- Program new start - Chartered steering committee and established management structure - Initiated feasibility studies for advanced diagnostics of materials and components - Developed priority list for component/subsystem aging models - Conducted laboratory test of existing stockpile components /materials to develop a materials aging model as an analytical design tool for future weapon performance prediction - Developed non-destructive test capability to bridge the destructive lab test to a non-destructive evaluation	- Develop methods to be used in fabricating diagnostic prototypes - Complete initial set of material models and begin experiments for validation - Begin development of age aware firing system and surety system models - Complete micro-structure assessments of high explosives in the stockpile - Define initial integrated sensor package for in-situ monitoring - Establish an enhanced flight test program to improve confidence in nuclear package delivery and flight performance

FUNDING LEVELS:

$0	$18,872	$40,000

PRODUCTION CAPABILITY ASSURANCE PROGRAM: This program maintains long-term competence in key manufacturing technologies and processes which are needed to ensure the viability of the enduring stockpile., This includes rebuilding enduring stockpile components, and the development and demonstration of components, subassemblies, and assemblies which could be used to upgrade the safety, security, and reliability of the enduring stockpile. Program activities are focused on maintaining a viable nuclear capability in the absence of explicit Department of Defense requirements for the production or retrofit of nuclear weapons. This program supports development activities to facilitate standardization, implementation of modern principles in design and manufacturing, process improvements and materials capabilities to improve the baseline production and surveillance processes.This program also supports technology development activities to eliminate or minimize waste generation and workplace hazards resulting from performance of assigned mission.

CHANGE FROM FY 1996:
FY 1997 program decreased from its FY 1996 level of activity. This decrease is due to the funding of key processes by the W87 Life Extension and B53 Replacement programs as well as ongoing activity to redefine the appropriate technologies and processes necessary to support the enduring stockpile within the fiscal resources available.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:

- Maintained competency in key technologies, manufacturing processes and plant operations:
  - high power detonator development
  - pit support and tube loading at LANL
  - development for W76 ACORN, Terrazzo reclamation, and Kyle reservoir loading at SR
  - enriched uranium recycling
  - depleted uranium and uranium alloys casting, and plating/coating processes
- Maintained development and product interrelationships among the DOE design laboratories and the production plants
- Provided pollution and hazard prevention alternatives to open detonation and open burning of high explosives, and disposal of energetic components from dismantlements
	- Maintain competency in key technologies, manufacturing processes and plant operations:
	  - high power detonator development
	  - pit support and tube loading at LANL
	  - development for W76 ACORN, Terrazzo reclamation, and Kyle reservoir loading at SR
	  - enriched uranium recycling
	  - depleted uranium and uranium alloys casting, and plating/coating processes
	- Maintain a development and product interrelationships among the DOE design laboratories and the production plants
	- Provide pollution and hazard prevention alternatives to open detonation and open burning of high explosives, and disposal of energetic components from dismantlements
		- Maintain competency in key technologies, manufacturing processes and plant operations:
		  - high power detonator development
		  - pit support and tube loading at LANL
		  - development for W76 ACORN, Terrazzo reclamation, and Kyle reservoir loading at SR
		  - enriched uranium recycling
		- Maintain a development and product interrelationships among the DOE design laboratories and the production plants
		- Provide pollution and hazard prevention alternatives to open detonation and open burning of high explosives, and disposal of energetic components from dismantlements

FUNDING LEVELS:

$43,850	$40,500	$39,000

MATERIALS RECYCLE AND RECOVERY: This program includes activities associated with recycle and recovery of plutonium, enriched uranium, and tritium from fabrication and assembly operations, limited life components, and dismantlement of weapons and components. It also involves the process in recycling and purifying the above materials to meet specifications for safe, secure, and environmentally acceptable storage. In addition, this program includes effort for plutonium and uranium related to the development and implementation of new processes or improvements to existing processes for fabrication and recovery operations, and for material stabilization, conversion, and storage. These activities are largely conducted at the Los Alamos, Savannah River, and Y-12 sites.

CHANGE FROM FY 1996:
FY 1997 program activity is level with FY 1996.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Supported tritium extraction operations of Savannah River targets - Met directive schedule for tritium reservoir refills - Updated criticality safety analysis, operating procedures, and implemented conduct of operations procedures - Completed plutonium analysis and prioritization of items for processing and stabilization at LANL - Initiated repackaging of canned plutonium metal oxide to new storage standards	- Support tritium extraction operations of Savannah River targets - Meet directive schedule for tritium reservoir refills - Continue safety analysis update requirement, conduct of operations, training to qualify and certify chemical operators to support resumption activities - Maintain base necessary for viable operation of TA-55 nuclear facilities - Continue plutonium stabilization activities - Expand nuclear processing technology base	- Complete tritium extraction operations of remaining Savannah River targets - Meet directive schedule for tritium reservoir refills - Restart and operate chemical recovery processes at the Y-12 Plant - Continue conduct of operations and training for chemical operators - Maintain base necessary for viable operation of TA-55 nuclear facilities - Continue plutonium stabilization activities - Expand nuclear processing technology base

FUNDING LEVELS:

$37,480	$40,090	$40,260

206

PRODUCTION SUPPORT: Production Support activities include quality and production supervision and control, SNL quality assurance activities, production and process engineering, facility startup and standby, and field engineering. Supports the Stockpile Maintenance, Evaluation, Dismantlement, Materials Recycle and Recovery, and Production Capability Assurance Programs.

CHANGE FROM FY 1996:
FY 1997 program decrease is due primarily to (1) the FY 1996 Congressional nonrecurring increase of approximately $56 million in this program element for maintaining infrastructure and capabilities, and (2) a reduced level of support for resumption activities at the Y-12 Plant and a reduced level of tritium activities at the Savannah River site.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Supported the B61 Mod and ALT, W76 ALT, B83 Mod and ALT, W87 ALT life extension programs - Supported ACORN product line development activities - Support joint test assembly program - Supported the design and development of the AT-400A pit storage container - Supported the Replacement Tritium Facility at the Savannah River Site - Supported development of uranium technologies at LANL - Supported production engineering and MDE activities for the stockpile and reconfiguration programs at SNL - Supported the development prototyping capabilities for production of neutron generators, neutron tubes, thermal batteries and prototyping process characterization - Supported the design/development of the new Safeguards Transporter (SGT) - Support Y-12 Plant resumption activities	- Support the B61 Mod and ALT, W76 ALT, B83 Mod and ALT, W87 ALT life extension programs - Continue support of ACORN product line activities and mechanical assemblies technology for W87 - Support joint test assembly program - Support the Tritium Facilities at the Savannah River Site and other tritium activities - Support development of uranium technologies at LANL - Support production engineering and MDE activities for the stockpile and reconfiguration programs at SNL - Support the development, protyping capabilities for production of neutron generators, neutron tubes, thermal batteries and prototyping process characterization - Develop technologies to produce a complete physics package at LANL - Cease production support activities for the Oxnard facility - Support initial procurement of AT-400A container - Support Y-12 Plant's resumption activities	- Support the B61 Mod and ALT, W76 ALT, B83 Mod and ALT, W87 ALT life extension programs - Continue support of ACORN product line activities and mechanical assemblies technology for W87 - Support joint test assembly program - Support the Tritium Facilities at the Savannah River Site - Support development of uranium technologies at LANL - Support production engineering and MDE activities for the stockpile and reconfiguration programs at SNL - Support the development, protyping capabilities for production of neutron generators, neutron tubes, thermal batteries and prototyping process characterization - Develop technologies to produce a complete physics package at LANL - Qualify new, unscheduled transferred technologies at Kansas City Plant - Continue AT-400A procurements - Continue to support Y-12 Plant's Resumption activities

FUNDING LEVELS:

$251,600	$307,020	$257,040

TRANSPORTATION SAFEGUARDS: The mission of the Transportation Safeguards Program is to provide safe, secure movement of nuclear weapons, strategic quantities of Special Nuclear Material, nuclear test devices, selected non-nuclear weapon components, and limited life components to and from military locations and between nuclear complex facilities within the continental United States. This program element does not include the cost for the couriers and other administrative personnel (Federal Employees) who execute this program. These costs include salaries and benefits, travel, and training, and have been transferred to the Weapons Activities Program Direction decision unit.

CHANGE FROM FY 1996:
FY 1997 program increase is due to higher funding ($10M) for the production of the Safeguards Transporter (SGT).

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Supported development of the new Safeguards Transporter (SGT) - Supported the level of weapon deliveries and stockpile modifications specified in the current Production and Planning Directive - Supported an operational vehicle and communications maintenance program for the fleet including refurbishment of trailers, escort vehicles and tractors - Supported the Sapphire project - Supported Base closure weapons movement - Funding for salaries, benefits, travel and training of couriers for this program is now provided from the Weapons Activities Program Direction Decision Unit.	- Supports development and provides funding for preproduction and prototyping of the new Safeguards Transporter (SGT) - ($3M) - Supports the level of weapon deliveries and stockpile modifications specified in the current Production and Planning Directive - Provides operational fleet vehicles and communications systems through repair and refurbishment, and modifications to enhance safety and security - Continues support of Base closure weapons movement - Funding for salaries, benefits, travel and training of couriers for this program is now provided from the Weapons Activities Program Direction Decision Unit.	- Continues incremental funding for production of 17 new Safeguards Transporters (SGT) - ($13M) - Supports the level of weapon deliveries and stockpile modifications specified in the current Production and Planning Directive - Maintenance of an aggressive vehicle maintenance program for 58 SSTs and a satisfactory communications system - Continues support of Base closure weapons movement - Funding for salaries, benefits, travel and training of couriers for this program is now provided from the Weapons Activities Program Direction Decision Unit.

FUNDING LEVELS:

$47,170	$59,305	$65,289

ENVIRONMENT, SAFETY, AND HEALTH PROGRAMS: The Environment Program consists of implementing and maintaining a base program to support compliance with environmental laws, such as federal, state and local laws, and DOE Orders. The Waste Management Program maintains compliance with related federal, state, and local laws, and DOE Orders, and includes waste management activities at the weapons facilities not specifically provided for in the Environmental Restoration/Waste Management Five Year Plan. The Safety and Health Program supports activities directed to the protection of the safety and health of the public and employees, as required by federal, state, regional and local law or regulation, Executive Orders, and DOE Orders. Infrastructure program activities are basically ongoing year to year and usually do not have new significant initiatives. Detailed below are continuing measurable performance activities.

CHANGE FROM FY 1996:
Overall there is a small increase in this program. However, (1) the FY 1997 Environment Program reflects a reduction due to decreased support for the site-wide Environmental Impact Statement at Pantex and reduced costs at the Savannah River Site Tritium Division, (2) the FY 1997 Waste Management Program reflects an increase due to higher costs at Pantex driven by reduced Environmental Management (EM) funds provided to the site, implementation and support of a recycling program at the Kansas City Plant, and resumption activities at Y-12, and (3) the FY 1997 Safety and Health also reflects an increase due to additional safety engineers at the Y-12 Site in support of the enriched uranium activities, and for increased outside contracts at the Pantex Plant for fire protection engineering and fire hazards analysis.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:

- Environment Program: $25.6M
  - Protected air and water quality by complying with the Clean Air, Clean Water, and the Safe Drinking Water Acts
  - Controlled solid and hazardous waste generation
  - Controlled toxic substances by complying with CERCLA, RCRA, etc.
  - Supported a site-wide Environmental Impact Statement (EIS) at the Pantex Plant
- Waste Management Program: $5.9M
  - Characterized, certified, and packaged waste
  - Moved and disposed of sanitary waste
  - Provided technical support for processing waste generated by weapons activities
  - Support for a high volume of waste generation at the Pinellas Plant due to safe shutdown activities
	- Environment Program: $24.3M
	  - Protect air and water quality by complying with the Clean Air, Clean Water, and the Safe Drinking Water Acts
	  - Control of solid and hazardous waste generation
	  - Control toxic substances by complying with CERCLA, RCRA, etc.
	  - Supported site-wide EIS at the Pantex Plant
	  - Reduce program activities due to reductions at the Savannah River Site (SRS) Tritium Division and elimination of Stockpile Management funding at Pinellas Plant
	- Waste Management Program: $5.5M
	  - Characterize, certify, and package waste
	  - Move and dispose of sanitary waste
		- Environment Program: $22.4M
		  - Protect air and water quality by complying with the Clean Air, Clean Water, and the Safe Drinking Water Acts
		  - Control of solid and hazardous waste generation
		  - Control of toxic substances by complying with CERCLA, RCRA, etc.
		  - Reduce support of the site-wide EIS at the Pantex Plant
		  - Reduce program activities due to reductions at SRS Tritium Division
		  - Support a site-wide EIS at the Y-12 Plant
		- Waste Management Program: $7.7M
		  - Characterize, certify, and package waste
		  - Move and dispose of sanitary waste

FY 1995 Continued - ES&H	FY 1996 Continued - ES&H	FY 1997 Continued - ES&H

- Safety and Health Program: $79.2M
  - Provided emergency preparedness activities at the sites
  - Provided fire protection at the sites
  - Maintained industrial hygiene, industrial safety, occupational medical services, radiological protection programs
  - Provided nuclear safety and transportation support function
	- Provide technical support for processing waste generated by weapons activities
	- Safety and Health Program: $84.8M
	  - Provide emergency preparedness activities at the sites
	  - Provide fire protection at the sites
	  - Maintain industrial hygiene, industrial safety, occupational medical services, radiological protection programs
	  - Provide nuclear safety and transportation support function
	  - Increase criticality safety/radiation protection activities at Y-12 for resumption of operations
		- Provide technical support for processing waste generated by weapons activities
		- Implement recycling program at the Kansas City Plant
		- Safety and Health Program: $87.8M
		  - Provide emergency preparedness activities at the sites
		  - Provide fire protection at the sites
		  - Maintain industrial hygiene, industrial safety, occupational medical services, radiological protection programs
		  - Provide nuclear safety and transportation support function
		  - Continue criticality safety/radiation protection activities at Y-12 for resumption of operations

FUNDING LEVELS:

$110,600	$114,640	$117,830

210

SAFEGUARDS AND SECURITY: The main purposes of the Safeguards and Security Program are to assure protection of all classified material, vital facilities, government property and plant personnel, provide and operate the protective force program, and administer the Nuclear Material Control and Accountability Program. Infrastructure program activities are basically ongoing year to year and usually do not have new significant initiatives. However, some programs and other related security and safeguards activities (information security, operational security, personnel security, computer security, etc.) will need to be updated to assure they serve the changing DP mission. Detailed below are continuing measurable performance activities.

CHANGE FROM FY 1996:
FY 1997 program increase is driven largely by inflation but also reflects increased effort to support DOE field sites declassification initiative activities.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Maintained and operated a protective force program - Developed site security plans and procedures - Provided adequate level of security education for employees - Administered the Personnel Security Assistance Program - Designed, operated, and supported site physical security systems - Administered technical surveillance countermeasures and TEMPEST programs - Supported DOE declassification initiative - Ensured accountability of Special Nuclear Material and other nuclear material	- Maintain and operate a protective force program - Develop site security plans and procedures - Provide adequate level of security education for employees - Administer the Personnel Security Assistance Program - Design, operate, and support site physical security systems - Administer technical surveillance countermeasures and TEMPEST programs - Support DOE declassification and "common badge" initiatives - Ensure accountability of Special Nuclear Material and other nuclear material - Support review of new DP initiatives to assure appropriate safeguards and security is considered in design and implementation	- Maintain and operate a protective force program - Develop site security plans and procedures - Provide adequate level of security education for employees - Administer the Personnel Security Assistance Program - Design, operate, and support site physical security systems - Administer technical surveillance countermeasures and TEMPEST programs - Support DOE declassification and "common badge" initiatives - Ensure accountability of Special Nuclear Material and other nuclear material - Continue support of review of new DP initiatives to assure appropriate safeguards and security is considered in design and implementation

FUNDING LEVELS:

$86,010	$89,560	$93,630

SITE PLANNING, UTILITIES, and MAINTENANCE: The Site Planning Program provides space management and facility planning with focus on DOE's initiative consolidation and downsizing of the weapons complex, administers the energy management program in support of energy conservation, and provides support for facility engineering services. The Maintenance Program provides preventive, corrective, and emergency maintenance of facilities and associated equipment. The Utilities Program supports the procurement of utility services, the facility operation, and maintenance for utility consumption at all sites. Infrastructure program activities are basically ongoing year to year and usually do not have new significant initiatives. Detailed below are continuing measurable performance activities.

CHANGE FROM FY 1996:
FY 1997 overall increase in these programs is driven by higher activity in the Maintenance and the Site Planning Programs for activities associated with facilities downsizing and consolidation.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Site Planning: $38.0M - Administer the energy management program to meet the DOE goal of 10% reduction of energy consumption in FY 1995 - Prepare Conceptual Design Reports, construction project data sheets, and cost estimates - Develop design criteria for general project planning, tracking, reporting, and management - Support planning for consolidation and downsizing of the weapons complex - Perform plant engineering services - Maintenance: $124.1M - Provided corrective and preventative maintenance services - Implemented new computerized work control system at 3 sites - Provided support for downsizing efforts	- Site Planning: $32.6M - Administer the energy management program to meet the DOE goal of 30% reduction of energy consumption by FY 2005 - Prepare Conceptual Design Reports, construction project data sheets, and cost estimates - Develop design criteria for general project planning, tracking, reporting, and management - Support planning for consolidation and downsizing of the weapons complex - Perform plant engineering services - Maintenance: $123.2M - Provide corrective and preventative maintenance services - Provide support for downsizing efforts - Begin effort to minimize on-site materials needed for maintenance - Incorporate more predictive maintenance techniques in day-to-day operations	- Site Planning: $32.1M - Administer the energy management program to meet the DOE goal of 30% reduction of energy consumption by FY 2005 - Prepare Conceptual Design Reports, construction project data sheets, and cost estimates - Develop design criteria for general project planning, tracking, reporting, and management - Accelerate planning and transition for consolidation and downsizing of the weapons complex - Perform plant engineering services - Maintenance: $121.3M - Provide corrective and preventative maintenance services - Provide support for downsizing efforts - Continue effort to minimize on-site materials needed for maintenance - Continue to incorporate more predictive maintenance techniques in day-to-day operations

FY 1995 Continued - Site Planning, Utilities, & Maintenance	FY 1996 Continued - Site Planning, Utilities, & Maintenance	FY 1997 Continued - Site Planning, Utilities, & Maintenance
- Utilities: $52.4M - Procured utility services at all sites - Managed utility operation and resources associated with utility consumption - Maintained full compliance with all Federal, state, and local laws, regulations, policies, and permits	- Utilities: $56.4M - Procure utility services at all sites - Manage utility operation and resources associated with utility consumption - Maintain full compliance with all Federal, state, and local laws, regulations, policies, and permits - Prepare to implement and provide support for improved utility master planning activities	- Utilities: $55.3M - Procure utility services at all sites - Manage utility operation and resources associated with utility consumption - Maintain full compliance with all Federal, state, and local laws, regulations, policies, and permits - Prepare to implement and provide support for improved utility master planning activities

FUNDING LEVELS:

$214,500	$212,180	$208,720

MANAGEMENT AND ADMINISTRATION: The Management and Administration Program provides for those activities associated with general management and administrative functions which include: information outreach, information services, taxes, human resources, chief financial officer, procurement, legal support, logistic support, administrative support, quality assurance, management fees, executive direction, and laboratory directed research and development. Infrastructure program activities are basically ongoing year to year and usually do not have new significant initiatives. Detailed below are continuing measurable performance activities and one new initiative in FY 1997. This new initiative will provide one-half ($5 million) of the funding requirement for the National Resource Center for Plutonium (PRC) in Amarillo, Texas. The Office of Fissile Material Disposition will budget the other half ($5 million) for PRC activities in FY 1997. PRC has a total budget of $10 million in FY 1997.

CHANGE FROM FY 1996:

FY 1997 program increase is driven by the funding of the pension plans/sales tax liability at Mound and Pinellas and higher institutional allocations at the Los Alamos National Laboratory and the Sandia National Laboratories. Defense Programs has the responsibility to fully fund the pension funds and sales taxes liabilities (total of $49,000) at the Mound and Pinellas Plants through FY 1995. These two plants were transferred to the Office of Environmental Restoration and Waste Management who became the sites landlord beginning in FY 1996. The new initiative of funding one-half of the National Resource Center for Plutonium activities will be handled within available funds.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995 :	FY 1996:	FY 1997:
- Maintained appropriate program in human resources - Maintained a public relations, information outreach program - Provided computer services, telecommunications, general purchasing and transportation services - Provided financial services (including taxes) - Maintained training program to assure employees are adequately trained - Supported legal staff, site management, operational surety and quality programs, and award fees - Provided support to the Laboratory Directed R&D activities	- Maintain an appropriate program in human resources - Maintain a public relations, information outreach program - Provide computer services, telecommunications, general purchasing and transportation services - Provide financial services (including taxes) - Maintain a training program to assure employees are adequately trained - Support legal staff, site management, operational surety and quality programs, and award fees - Provide support to the Laboratory Directed R&D activities - Provide initial payment on DP pension fund liability at Mound and Pinellas-$10M	- Maintain an appropriate program in human resources - Maintain a public relations, information outreach program - Provide computer services, telecommunications, general purchasing and transportation services - Provide financial services (including taxes) - Maintain a training program to assure employees are adequately trained - Support legal staff, site management, operational surety and quality programs, and award fees - Provide support to the Laboratory Directed R&D activities - Fully fund DP pension fund/sales tax liability at Mound and Pinellas-$39M - Provide one-half of the funding ($5 million) for the National Resource Center for Plutonium in Amarillo, Texas in the Pantex site budget

FUNDING LEVELS:

$213,210	$235,790	$260,000

Special Projects and Other: Includes funding for the Albuquerque, Oak Ridge, and Savannah River Operations Offices and to Headquarters for the conduct of special projects, one-time efforts or complex-wide efforts that do not fit easily into other budget categories and for which special control or visibility is required. Items at the Albuquerque Operations Office include support for Ross Aviation which supports the Safe, Secure Transport Program; radiation effects research; support for environmental impact statements, and other complex-wide efforts. Funding at the Oak Ridge Operations Office provides contractual support for resumption activities at the Y-12 Plant. Funding at the Savannah River Operations Office includes support for Safeguards and Security Costs for the Tritium area at the Savannah River Site and for other activities that provide direct programmatic support.

CHANGE FROM FY 1996:

FY 1997 program decrease for the Special Projects and Other Program is driven by the reduced requirement for technical contractual services in support of resumption activities for the Y-12 Plant. This is a new program element in FY 1997 which represents the programmatic activities that were included in the former Federal Support Program element. All Federal employee salaries and benefits and other related costs previously budgeted under Federal Support have been transferred to the Weapons Activities Program Direction decision unit.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Supported various special projects including direct programmatic technical contractual support at the Albuquerque Operations Office. Funding for Ross Aviation was provided from prior year obligations. ($3,565) - Provided technical contractual support of Y-12 resumption activities at the Oak Ridge Operations Office. ($3,750) - Supported the contract with Wackenhut Services, Inc. to provide safeguards and security for the Tritium area at the Savannah River Site. Supported other direct programmatic contractual support. ($2,925)	- Supported various special projects including direct programmatic technical contractual support (EISs, container safety, radiation effects, weapons/components shipping, etc.) at the Albuquerque Operations Office. ($22,308) - Provided technical contractual support of Y-12 resumption activities at the Oak Ridge Operations Office. ($3,200) - Supported the contract with Wackenhut Services, Inc. to provide safeguards and security for the Tritium area at the Savannah River Site. Supported other direct programmatic contractual support. ($3,935) - Supported special projects including a Uranium Vulnerability Assessment at the Y-12 Plant to be managed by the Office of Environment, Safety and Health. ($4,094).	- Supports various special projects including direct programmatic technical support contracts (EISs, container/packing safety, radiation effects, weapons/components shipping, etc.) at the Albuquerque Operations Office. ($19,434) - Provides technical support contracts in support of Y-12 resumption activities at the Oak Ridge Operations Office. ($800) - Supports the contract with Wackenhut Services, Inc. to provide safeguards and security for the Tritium area at the Savannah River Site. Supported other direct programmatic technical support contracts. ($3,945) - Supports various special projects (assessments, analyses, field support/reviews, etc.) at headquarters. ($3,994)

FUNDING LEVELS:

$10,240	$33,537	$28,173

CAPITAL EQUIPMENT is required by the four production plants and three weapons laboratories to maintain the capabilities necessary for stockpile maintenance, stockpile evaluation, and dismantlement activities.

CHANGE FROM FY 1996:
Level funding from FY 1996 supports the additional purchase of computer equipment and the expanded stockpile support activities of the national laboratories.

FUNDING LEVELS:

FY 1995	FY 1996	FY 1997
$19,680	$24,190	$21,948

GENERAL PLANT PROJECTS provide funding for low cost construction projects (less than $2 million) required to maintain the infrastructure and ongoing Stockpile Management programs of the four production plants and the three weapons laboratories.

FUNDING LEVELS:

FY 1995	FY 1996	FY 1997
$1,000	$10,000	$7,000

CONSTRUCTION LINE ITEMS:

CHANGE FROM FY 1996:
There are two new ES&H projects and three new programmatic projects included in the FY 1997 request. The ES&H projects are **97-D-124, Steam Plant Wastewater Treatment Facility, Y-12** (TEC:$3.6 million), which provides improvements to the existing process and operation of the treatment facility and is required to meet wastewater discharge limits of the National Pollutant Discharge Elimination System permit; and **97-D-123, Structural Upgrades, KC** (TEC:$18.0 million) will correct structural overstress caused by gravity loads which pose a failure hazard, and reinforce masonry walls to resist seismic loading.

The programmatic projects include **97-D-122, Nuclear Materials Storage Facility (NMSF) Renovation, LANL,** (TEC:$45.3 million), which provides the necessary renovations to an existing facility that was never operational. The facility will include a multi-level storage vault designed and constructed for long- and intermediate-term storage of large quantities of special nuclear materials. The NMSF location is most advantageous to move vault holdings and still keep them close enough to continue ongoing plutonium process missions; **97-D-121, Consolidated Pit Packaging System (CPPS), PX** (TEC:$7.31 million), which provides the modifications to four bays of the existing Special Nuclear Material Component Staging Facility to accommodate the installation of the CPPS for the hermetically sealed AT-400A container. Pantex has received the mission assignment for installing a pit packaging process. The CPPS will provide an automated plutonium pit shipping and storage container repackaging system to meet International Atomic Energy Agency and Department of Transportation requirements for fissile material transportation containers; and **88-D-122, Facilities Capability Assurance Program, Subproject 97-42, Hydraulic Press, Y-12** (TEC: $14.0 million), will procure and install a new 3,500 ton press required to support Defense Programs consolidation by completion of the equipment requirements for the depleted Uranium and Uranium alloy capabilities. This project will ensure the requirement to maintain nuclear competence and fully realize annual operating cost reductions. It supports expected enhancements in worker health and safety by reducing potential exposure to airborne radioactive material and elimination of point of operation risks.

The FY 1997 funding for New Start Projects will support the Titles I and II engineering design and associated integration activities for these projects.

FUNDING LEVELS:

Stockpile Management

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A
Pantex Plant, Amarillo, Texas

2a. Project No. 97-D-121
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1997

3b. A-E Work (Titles I & II) Duration: 8 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- None
Total Project Cost (TPC) -- None

4a. Date Physical Construction Starts: 4th Qtr. FY 1997

4b. Date Construction Ends: 3rd Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $ 7,310
TPC -- $20,550

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1997	$ 870	$ 0	$ 870	$ 820
1998	6,440	0	6,440	6,490

8. Project Description, Justification and Scope

The Department of Energy (DOE) has a requirement to safely package, store, and ship the plutonium pits that are removed from our disassembled nuclear warheads. Currently, pits are packaged in the AL-R8 storage container which does not meet all of the current standards for storage and transportation and is being replaced by the AT-400A container, a hermetically sealed vessel. Pits currently stored in the AL-R8 and other pits removed during weapon's dismantlement are being packaged in AT-400A containers by an initial, temporary, mechanical packaging line that can only process an estimated maximum of 1,000 pits per year into the new container. At this rate, it will take approximately twenty years to complete the packaging of the projected 17,00 pits. Therefore, to package the pits into the safest container in a more reasonable time, DOE is developing a robotics system that will package an estimated maximum of 1,500 pits per year. By using this system in conjunction with the existing mechanical system, the backlog of pits can be packaged by the year FY 2007; however, the system requires installation in a facility that meets Non-Reactor Nuclear Facility requirements. This project, with a TEC of $7,310,000, will modify an existing non-reactor nuclear facility to accept the new robotics system. The TPC is $20,550,000 because it includes the costs for the development and fabrication of the complete robotics and packaging systems; so that all related costs are reflected for a complete and usable facility.

This project consists of the design, development, production, and installation of the Consolidated Pit Packaging System (CPPS) and the design and construction necessary to support the modification of the Special Nuclear Material Component Staging Facility (SNMCSF), Building 12-116 to house the CPPS. Modifications to the SNMCSF rooms 145, 146, 147, and 148 will include upgrades to the utility, lighting, and heating ventilation and air conditioning (HVAC) systems.

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A Pantex Plant, Amarillo, Texas (Continued)	2a. Project No. 97-D-121 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The CPPS is being developed jointly by Sandia National Laboratories (SNL) and Mason and Hanger-Silas Mason Company, Inc. (MHSM), with technical oversight from Los Alamos National Laboratory (LANL) and Lawrence Livermore National Laboratory (LLNL). Once developed and implemented the CPPS will have the capacity to repackage 1,500 pits per year from the current container, into the AT-400A container system. The AT-400A container system includes a welded stainless steel inner containment vessel that provides a hermetic seal and a stainless steel outer container. In addition, the hermetic seal of the AT-400A containment vessel allows a final backfill of a non-reactive gas which is ideal for interim storage.

After facility modifications are completed, the CPPS will be installed into the following areas: Room 146 will house an automated processing line that will utilize a Robot to remove the pit from the current container and position it at various automated stations where inspection, weighing, leak detection, and assembly into the AT-400A containment vessel will occur. After assembly into the containment vessel, the equatorial seam of the containment vessel will be welded using an automated Metal Inert Gas welding system. Room 147 will house the leak test and purge and backfill equipment to perform the leak detection and final backfill of the containment vessel. Room 148 will be used as a receiving area for incoming pits to be repackaged, parts to feed the automated line, and for assembly of the AT-400A containment vessel into the AT-400A outer container. Rooms 146, 147, and 148 contain 4,300 gross square feet. The equipment that makes up the CPPS will occupy approximately 1,490 net square feet. The remaining space is required for personnel access to the operating stations that could not be fully automated and for pit movement between operating stations. Room 145 will be modified to include an upgrade to the utilities, lighting, and the HVAC systems. These upgrades will allow room 145 to accept the existing mechanical pit packaging processing line if it needs to be moved from its original location; or the addition of a second automated processing line if it is required to meet future mission requirements.

To meet the 1,500 pits per year capacity requirement, minimize the personnel radiation exposure, and reduce safeguards and security risks, an automated processing line must be developed and implemented in the SNMCSF. To meet the capacity requirements MHSM must develop an automated weighing system, fast leak detection system for the pit and containment vessel, and purge and backfill system. The philosophy used to develop these high capacity vacuum systems will be to build prototype systems that can be used to demonstrate and optimize the capability. Once the capability has been demonstrated it is optimized to provide the highest capacity. The final design is then documented and actual production systems are built and installed in the operating areas. The cost for the MHSM development will be a part of the plant operating expense. These costs include the design and development of the capability, the system optimization, and the hardware costs to build the prototype system. The costs of the equipment procured to perform the production activity will be included as a part of the project capital equipment cost. The highest potential for personnel radiation exposure is associated with the handling of the bare pit. To minimize personnel exposure SNL is developing a robotics system that will unpackage the pit from the current container, remove the inner fixture from the pit, transport the pit to each of the automated operating stations, and assemble the pit into the inner fixture mounted inside the lower half of the AT-400 containment vessel. Development costs for this robotics system include hardware costs for the robot, the robot controller, the computer system for programming the robot, design and hardware costs for tooling, design and production costs for software, and costs associated with risk analyses to determine safety factors for handling nuclear material with a robot.

Once developed this entire system will be transitioned to the operating environment and be used for production. The development costs associated with the robotics system will be funded through operating expense.

Capital equipment will be procured as a part of this project. Prototype equipment will be transitioned to support production wherever possible. The capital equipment required as a part of this project typically falls into one of two categories. There are several pieces of capital equipment required to assemble the production vacuum systems. This equipment includes the leak detection systems, manifolds for the purge and backfill systems, welders, computers for system control, and computer systems for data acquisition and data reduction. The second category is analytical equipment used to support the process. This equipment includes radiation swipe readers, leak detection equipment, and metallography equipment, and other inspection equipment.

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A Pantex Plant, Amarillo, Texas (Continued)	2a. Project No. 97-D-121 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The equipment radiation shielding, which will enclose the manual portion of the robotics operations line, will be designed by MHSM in coordination with Battelle/Pantex. During the development of the CPPS, Battelle/Pantex and MHSM will cooperate to determine adequacy of the design. ALARA (as low as reasonably achievable) principles will be met.

The existing shelving units in Rooms 145 and 148 will be disassembled and relocated to Building 10-9 for excess.

There will be no improvements to land (the property) on this project. Site work will include erection of a temporary construction fence only. All site work will be coordinated with any ongoing utility and construction projects. There will be no exterior utility work required to support this project. Temporary fences will totally enclose the construction area. Gates will be provided at the necessary locations for entry into the construction area. Temporary fences will be located at the required, unbarricaded intraline distance from Building 12-99 to minimize production downtime in this building.

The existing HVAC system serving rooms 145-147 will be modified as required to support the CPPS, including dedicated fan coil units, task exhausts, centralized dehumidifier unit, nuclear grade High Efficiency Particulate Air (HEPA) filters, etc. for these rooms.

Mechanical utilities will be extended as required, including chilled water piping, Plant compressed air, vacuum, control systems etc. to Rooms 145-148. Utilities will be capped and plugged inside Room 145.

Interior electrical utilities will include extensions of secondary electrical power, Automated Energy Management System (AEMS), Radiation Alarm Monitoring System (RAMS), etc. from utilities currently existing in the Building, as applicable to the individual rooms.

Additional energy efficient low bay High Intensity Discharge overhead lighting will be required in Rooms 145-148 to upgrade lighting levels from a non-operational to an operational status.

An Architect-Engineer will perform a Means-of-Egress analysis per National Fire Protection Association (NFPA) 101 to address any Life Safety Code issues, and verify that existing fire protection systems in Rooms 145-148 will be adequate.

MHSM and Pantex Plant have been assigned the missions to perform interim storage of pits and to repackage from the current container into the AT-400A container system by FY 2002 an additional 7,000 pits above the existing mechanical line's capability. To meet these expectations, a project must be completed that provides the capability to package pits into a hermetically sealed vessel for interim storage with the capacity to repackage 1,500 pits per year.

The SNMCSF meets all applicable Non Reactor Nuclear Facility requirements. The design of the facility specifically addressed activities associated with operations involving Special Nuclear Material (SNM). The design is intended to mitigate the risk of a release of radionuclide to the public for natural phenomena such as tornadoes or earthquakes, for accidents such as an explosion in an adjacent facility, or for a processing accident within the facility. Placing the automated pit packaging line in the SNMCSF will take advantage of these design features and reduce the risk of a release of radionuclide to the environment.

The SNMCSF will house other operations involving SNM including interim storage, staging, weighing and leak detection, and radiography which are performed to meet stockpile surveillance requirements. The CPPS project will further consolidate packaging with these other SNM activities in this vault facility. Placing the packaging operations in a vault facility will reduce security risks associated with SNM operations in other facilities. Consolidation of these activities will reduce intra-plant transportation of pits through ramps to other facilities that do not meet the vault type construction. The reduction in transportation will improve both safeguards and security postures.

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A Pantex Plant, Amarillo, Texas (Continued)	2a. Project No. 97-D-121 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Implementation of the CPPS project in the SNMCSF will consolidate SNM processing. The automated pit packaging system will have robotics and control systems that will be very similar to the robotics and control systems utilized in the Weighing and Leak Check System (WALS) and the Pit Automated Radiography (PAR) systems that will be located in the SNMCSF. Commonality between automated systems will allow for additional cross training of personnel for operations and maintenance. Interactions between the automated systems can be optimized. Having all of these common activities in one facility with storage capacity in the same facility will be vital to the CPPS project meeting the capacity requirements.

Utilizing an automated packaging line that, (1) has been optimized for the highest capacity and, (2) has been consolidated in a facility that houses other related activities will meet the mission requirements in the safest most secure and efficient manner. To meet the packaging schedule the CPPS project must have an accelerated schedule with combined Title I/II design beginning in October 1996 and finish of construction in June 1998.

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A Pantex Plant, Amarillo, Texas (Continued)	2a. Project No. 97-D-121 2b. Construction Funded

9. Details of Cost Estimate a/b/

	Item Cost	Total Cost
a. Design and Management Costs		$ 1,330
(1) Engineering design and inspection at approximately 31 percent of construction costs	$ 380	
(2) Construction management costs at approximately 21 percent of construction costs (Item c)	260	
(3) Project management costs at approximately 23% of construction costs (Item c)	290	
(4) Preliminary Safety Analysis Report (PSAR)	120	
(5) Final Safety Analysis Report (FSAR)	280	
b. Land and land rights		0
c. Construction costs		1,220
1. Improvements to land (temporary security fencing)	80	
2. Building	900	
3. Special equipment	0	
4. Other structures	0	
5. Installation of capital equipment	240	
d. M&O contractor construction support		60 c/
e. Capital equipment		3,520
f. Major computer items		0
g. Removal cost less salvage		0
h. Design and project liaison, testing, checkout and acceptance		0
i. Subtotal (a through h)		$ 6,130
j. Contingencies at approximately 19 percent of above costs.		1,180
k. Total line item cost (Section 11.a.1.(a)).		$ 7,310
l. LESS: Non-Federal contribution		0
m. Net Federal total estimated cost (TEC)		$ 7,310

10. Method of Performance

Contracting arrangements are as follows: (a) design, procurement and construction: fixed-price contract awarded on the basis of competitive bidding.

a/ This estimate is based on the Conceptual Design Report dated July 1995.

b/ Costs have been escalated as follows for each portion of the project: ED&I - 6.072% (January 1997); CM/PM - 9.572% (January 1998); Construction - 9.572% (January 1998); Equipment - 9.572% (January 1998). Escalation is based on USDOE/HQ/PR-25/COND Guidelines dated September 1, 1994.

c/ This entry represents M&H Craft Support of the Contractor (barricade erection, x-raying walls etc.).

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A
Pantex Plant, Amarillo, Texas (Continued)

b. Related annual costs (estimated life of project--20 years)	
1. Facility operating costs	$ 0
2. Facility maintenance and repair costs	333
3. Programmatic operating expenses directly related to the facility	769
4. Capital equipment not related to construction but related to the programmatic effort in the facility	0
5. GPP or other construction related to the programmatic effort in the facility	0
6. Utility costs	23
7. Other costs	0
Total related annual costs	$ 1,125

224

1. Title and Location of Project: Consolidated Pit Packaging System (CPPS) AT-400A Pantex Plant, Amarillo, Texas (Continued)	2a. Project No. 97-D-121 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item -- Narrative not required.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- None.
   (d) Inventories -- None.

2. Other project costs
   (a) R&D necessary to complete construction -- The $11,680,000 includes Sandia National Laboratories cost to develop automated robotics equipment, MHSM vacuum technology development, and retooling costs for the pit packaging process.
   (b) Conceptual design -- The $150,000 includes costs for conceptual design report and project management plan and NEPA documentation preparation.
   (c) Decontamination and decommissioning (D&D) -- There are no decontamination or decommissioning costs associated with this project.
   (d) NEPA documentation costs -- Includes preparation and review of NEPA checklist. Costs are included in conceptual design.
   (e) Other project related funding -- The $1,410,000 includes planning, design criteria preparation, A-E selection, preparation and the conduct of an Operational Readiness Review, startup and training.

b. Related annual costs

1. Facility operating costs -- Included in programmatic operating expenses directly related to the project.
2. Facility maintenance and repair costs -- Routine maintenance will be performed by Pantex Plant craftsmen dedicated to this project at an estimated cost of $333,000.
3. Programmatic operating expenses directly related to the facility -- Approximately $769,000 will include 10 production technicians, one supervisor and one engineer working normal 40 hour weeks. Total operating FTE's are based on a 20 year period, which will be considerably less than the first five years of operation, when 14 technicians and one supervisor will be required.
4. Capital equipment not related to construction but related to the programmatic effort of the facility -- There are no capital equipment costs, not related to construction, that are related to the programmatic effort of the project.
5. GPP or other construction related to the programmatic effort -- There are no maintenance, repair, GPP or other construction costs related to the programmatic effort of the project.
6. Utility costs -- Costs consists of the cost of electricity required for the project estimated at $23,000.
7. Other Costs -- None.

4b. Date Construction Ends: 2nd Qtr. FY 2001

6. Current Cost Estimate:
TEC -- $45,292
TPC -- $56,653

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1997	$ 4,000	$ 0	$ 4,000	$ 3,380
1998	9,200	0	9,200	7,495
1999	15,200	0	15,200	13,767
2000	12,150	0	12,150	13,767
2001	4,742	0	4,742	6,883

8. Project Description, Justification and Scope

This project provides necessary renovations to the 84-D-104, Nuclear Materials Storage Facility, an FY 1984 line item project that was not designed or constructed to applicable DOE Order 6430.1A standards and requirements. The Los Alamos Nuclear Materials Storage Facility (NMSF) has never been operational. Funding is required to correct deficiencies in the building discovered after its beneficial occupancy in February 1987.

The NMSF is a multi-level (ground floor, intermediate level and basement) storage vault designed and constructed for long and intermediate term storage of large quantities of special nuclear materials (SNM). In addition to the storage vault, facility support areas include a secure shipping and receiving area, Safe Secure Trailer (SST) vehicle garage and dock, equipment spaces, non-destructive assay (NDA), toilet/change rooms, general storage areas, a freight elevator, and a transfer tunnel to connect NMSF to the existing plutonium facility at TA-55. The entire facility is 30,400 gross square feet. The multi-level hardened vault is approximately 15,700 square feet and contains shipping and receiving, NDA, general storage on the ground level, and an approximately 8,500 square feet SNM vault in the basement. The automated storage and retrieval equipment (overhead gantry robot) is controlled by micro-computers connected to the Los Alamos Material Accounting System. General storage for oversized items is also provided in the vault area.

1. Title and Location of Project: Nuclear Materials Storage Facility Renovation Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Required modifications to achieve facility operation are as specified below:

- Safeguards and Security Upgrades including Perimeter Intrusion Detection and Assessment System (PIDAS) additions and hardened control point with necessary vestibule areas
- Install new mechanical and electrical equipment
- New High Efficiency Particulate Air (HEPA) Filtered HVAC System
- New Utility building to house natural gas boiler and chillers/pumps
- Reconfiguration of "hardened" structure to establish Material Access Area (MAA)
- Support Area Reconfiguration to prevent co-mingling and establish radiological control point
- Passive Vault Cooling System
- Vault Storage Array Reconfiguration
- Grounding counterpoise system to support sensitive equipment (e.g., alarms, monitors, and NDA)

Significant Changes

- Project was originally constructed as a FY 1984 line item and beneficial occupancy was granted in February 1987
- Facility was never operated due to design and construction deficiencies
- Laboratory burdens have been added to this project (FY 1997 new start)

The primary purpose of the project is to renovate an existing FY 1984 line item project that has never been operational to comply with DOE Orders 6430.1A and the 5480 series, particularly radiation control and exposure. The NMSF was developed as the central intermediate and long-term storage facility for LANL and is included in LANL's long-range plan. There is no other building at LANL with the storage capacity and protective devices that are available in the NMSF.

DOE has recently assigned weapons surveillance on New Materials Laboratory Testing (NMLT), Stockpile Laboratory Testing (SLT), and Shelf Life Program (SLP) activities from EG&G Rocky Flats Plant to Los Alamos National Laboratory (LANL). Each of these activities will be completed at LANL's PF-4 (TA-55) facility and will require a significant reduction in PF-4 vault holdings to accomplish this added mission. The NMSF, with its tunnel connection to PF-4, is the most advantageous location to move the PF-4 holdings and still keep them close enough to continue on-going plutonium process missions. This action meets the original intent of NMSF, which was to consolidate satellite storage activities throughout LANL to make each satellite's vault available to programmatic requirements.

Engineering studies and the Conceptual Design Report have determined the most cost-effective methodologies to bring the NMSF into compliance with DOE and Federal requirements. Those studies have included radiation protection, heat removal, safeguards and security, HVAC criteria, and hazards analysis. Additionally, operational user requirements and storage criteria have been studied, a comparison of DOE Order 6430.1A criteria to as-built conditions has been conducted and criticality assessments and unshielded radiological dose rate calculations have been made to provide a baseline for additional shielding requirements in the facility. Each of these studies has verified the need for the recommended renovations.

1. Title and Location of Project: Nuclear Materials Storage Facility Renovation Los Alamos National Laboratory, Los Alamos, New Mexico (Continued)	2a. Project No. 97-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Additional justification for the NMSF renovation is presented as follows:

- The NMSF provides the most cost-effective means to store NM at LANL. This is attributed to its proximity to PF-4, its large automated storage capacity and its built-in security features which reduce operating costs.
- The NMSF would establish an intermediate to long-term storage facility at LANL, enabling the PF-4 working vault in TA-55 to be used as a working vault: the continued use of the PF-4 working vault for storage of material excess to current activities significantly contributes to radiation exposures among PF-4 vault operations personnel, which is significantly more than the proposed RADCON manual design limits.
- The NMSF provides enhanced safeguards and security for NM operations (fewer personnel with access to intermediate/long-term storage material, remote handling/access to stored material, SST garage for enclosed loading/unloading activities, a tunnel for material transport to/from TA-55 processing areas, located within an existing Category I Protected Area, etc.).
- Removal of much of the LANL inventory to this storage facility will result in reduced radiation exposure levels.
- Upgrade vault shielding to current radiological control standards.
- The NMSF provides LANL with the facilities to meet its current missions, support lead laboratory activities, and to support interim storage options for LANL (to address site facility/storage issues) and the DOE (for complex-wide issues).

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- will provide a complete facility.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- Includes Engineering Studies, thermodynamic modeling, radiation modeling and heat removal studies.
      (b) Conceptual design -- Includes Functional and Operational Requirements, Conceptual Design Reports, Construction Project Data Sheets and Value Engineering activities: Preliminary Safety Analysis Report, Safety Analysis Report, Operational Readiness Review and startup activities. Many activities included in this cost category were begun in FY 1994.
      (c) Decontamination and Decommissioning (D&D) -- None.
      (d) NEPA documentation -- None.
      (e) Other project related funding -- NEPA documentation, includes Sitewide EIS support.

b. Related annual costs

   1. Facility operating costs -- This activity covers all staffing activities.
   2. Facility maintenance and repair costs -- Approximately $1,276,000 per year for repair and replacement costs.
   3. Programmatic operating expenses directly related to the facility -- $0 per year.
   4. Capital equipment not related to construction but related to the programmatic effort of the facility -- None.
   5. GPP or other construction related to the programmatic effort -- None.
   6. Utility costs -- $320,000 per year.
   7. Other Costs -- $963,000 related to Environmental/Waste Management, Security/Safeguards.

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1997	$ 1,400	$ 0	$ 1,400	$ 600
1998	4,800	0	4,800	2,500
1999	6,400	0	6,400	4,100
2000	5,400	0	5,400	5,200
2001	0	0	0	2,500
2002	0	0	0	2,000
2003	0	0	0	1,100

8. Project Description, Justification and Scope

This project is required to correct structural overstress caused by gravity loads and will reinforce masonry walls to resist seismic loading within the DOE controlled portion of the Bannister Federal Complex to ensure life safety. The first part of this line item is required to provide structural overstress relief in accordance with current building code and DOE Order requirements to ensure life safety. This type of overstress is caused by gravity loads (dead loads, live load and snow load) and wind loading only. The structural evaluation is still on-going, however, the findings to date indicate that corrective actions are needed to ensure life safety. Overstressed locations will be repaired to reduce the possibility of structural failure and bring the structure into conformance with DOE Orders and codes.

The second part of this line item is required to reinforce masonry walls to resist seismic loading. Approximately 75 percent of the masonry walls in the DOE controlled part of the Federal Complex are not reinforced to resist seismic loading. Seismic codes were not in place when the Kansas City Plant was constructed. Potential seismic overstresses have been identified because of the presence of many unreinforced masonry walls added to the building for fire protection purposes. The structural capacity of these unreinforced walls falls below that of the remaining structure and would fail at an early stage of seismic activity.

1. Title and Location of Project: Structural Upgrades, Kansas City Plant, Kansas City, Kansas (Continued)	2a. Project No. 97-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Corrective activities will be performed in DOE controlled areas only, unless an item is identified through the engineering study that would affect both DOE and the General Services Administration. This project will include the following upgrades:

- Column ribs will be post tensioned on end bays to increase bending moment capacity. This will be done by tensioning two steel rods underneath the subject ribs. The rods will be anchored into the end bay roof beam and bolted through to the interior roof beam.
- Selected rib ends will be supported with steel suspenders and long threaded rods through the roof shell or saddles and fastened to the roof beams to increase rib shear capacity and overcome the member strength loss due to existing cracking caused by excessive shear loading.
- Roof shell openings will be reinforced with steel straps adjacent to openings and parallel to the barrel axis. This provides a means of externally reinforcing the thin concrete shell.
- The mezzanine roof slab will be reinforced with intermediate steel beams supported by the concrete roof support beams.
- Supplemental support will be provided to mezzanine concrete roof structure integrity. This would stop further deterioration of the shell.
- Roof shell cracks will be injected with epoxy to reestablish roof structure integrity. This would stop further deterioration of the shell.
- Structural steel blocking will be attached to the roof structure on each side of existing masonry walls. This will eliminate drift during seismic activity and ultimately failure of the walls independent of the remaining structure. This blocking would be spaced approximately 4 feet center to center. The blocking would consist of steel angles fastened to a horizontal surface with the vertical leg of the angle placed against the top of the masonry wall and flat plates fastened to vertical surfaces of the roof structure and lapped down over the top course of the masonry walls.
- Steel strong-backs will be installed adjacent to masonry walls. This strong-back will be a structural tube fixed to the building floor at the bottom of the wall and roof structure at the top. The wall would be bolted to the strong-backs at approximately 4 feet centers. The strong-backs themselves would be on 8 foot centers. This would prevent a tall wall from collapse during a seismic event that produced lateral movement normal to the wall.
- The top of free-standing masonry walls will be supported with roof structure mounted braces. These braces would then be mounted to a steel strut fastened to the roof.

On December 16, 1993, a Kansas City Susceptibility Review and Walkdown was held at the Kansas City Plant at Albuquerque Operations Office, and Headquarters offices including the Office of Engineering and Operations Support, Office of Facilities, and Office of Construction and Capital Projects. This review was initiated as a result of the September 1993 report by an outside structural consulting firm that documented two principal areas of concern: existing structural overstresses and numerous unreinforced interior masonry walls. It was determined during the review that the structural overstresses and unreinforced masonry walls findings were an immediate concern as follows:

"First and foremost are the areas of facility structural overstress which pose a failure hazard. Secondly, the extensive amount of unreinforced masonry walls which pose a significant employee (life safety) hazard at very low ground accelerations."

1. Title and Location of Project: Structural Upgrades, Kansas City Plant, Kansas City, Kansas (Continued)	2a. Project No. 97-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Consequent planning resulted in the incorporation of structural modifications in all ongoing projects which appreciably renovate affected areas to provide an immediate response to initiate risk reduction and potential loss of government assets. These project changes were approved through the baseline change control process. Deficiencies in the remainder of the plant not affected by on-going projects are being addressed in this line item submission.

Gravity overstresses throughout the Kansas City Plant are currently being evaluated. The project is currently scoped and estimated to allow 10 percent overstresses, as allowed per DOE/HQ direction. The data gathered to date reflect the following:

Main Manufacturing Building Overstresses Under Gravity Loading:

- Roof Ribs - 14 percent of the ribs are overstressed.
- Roof Beams - < 1 percent of the beams are overstressed.
- Roof Shell With Openings - 34 percent of the roof shells are overstressed.
- Roof Shell Without Openings - 0 percent.
- Columns - 4 percent of the columns are overstressed. Basement Level Supported Floor Slab - 5 percent of the floor slab is overstressed.
- 2nd Level Supported Floor Slab - 6 percent of the floor slab is overstressed.

Seismic events can be generated by two faults. The New Madrid Fault is approximately 250 miles east of the Kansas City Plant. The New Madrid fault system extends 120 miles from the area of Charleston, Missouri and Cario, Illinois through New Madrid, Missouri and to Marked Tree, Arkansas. It crosses five state lines and crosses the Mississippi River in three places and the Ohio River in two places. The fault is active, averaging more than 200 measured events per year (1.0 or more on the Richter scale), about 20 per month. Tremors large enough to be felt (2.5-3.0 on the Richter scale) are noted annually. Every 18 months the fault releases a shock of 4.0 or more capable of local minor damage. Magnitudes of 5.0 or greater occur about once per decade, can do significant damage, and be felt in several states. A damaging earthquake along the fault of 6.0 or greater reoccurs about every 80 years with the last one in 1895. A major earthquake along the fault of 7.5 of greater happens every 200-300 years, with the last one in 1812. A quake of this magnitude would be felt throughout half of the United States. This information is based on a document titled "About the New Madrid Fault" from Southeast Missouri State University Center for Earthquake Studies, David Stewart, Director. The document is undated.

The other fault that could affect the Kansas City Plant is the Humbolt Fault Zone (Nehemma Ridge) located approximately 80 miles west of Kansas City in the Manhattan-Wamego, Kansas area. The largest earthquake that has occurred in Kansas is a probable Richter magnitude of about 5.2-5.3, which occurred in 1867 and can be expected to occur every 100 years. An earthquake of Richter magnitude 6.0-6.5 at this fault is likely to occur on average once in about 1000 years. This information is based on a document titled "Kansas Geological Survey" from the University of Kansas on October 10, 1990 by Don W. Steeples, Ph.D., Seismologist and Deputy Director.

The structural studies now underway will evaluate the design of the current walls, determine what forces they can be withstand, and evaluate the seismic probabilities from the faults in the areas to determine the corrective actions required. The project is currently scoped to meet the Uniform Building Code. Studies for earthquake to date have shown that the existing masonry walls are inadequate to withstand a low to moderate seismic event and should be reinforced.

8. Project Description, Justification and Scope (Continued)

The applicable DOE Orders and Codes that apply to this project are as follows:

- DOE Order 5480.28 Natural Phenomena Hazards (NPH) Mitigation Section 10a.(1) Design and Evaluation, which states "An additional objective for selected structures, systems and components (SSC) or site activities is to prevent loss of capability to perform functions consistent with: (1) importance to safety for workers and the public; (2) impact on the environment; (3) repair/replacement costs; (4) programmatic mission. NPR design and evaluation criteria for SSCs for earthquake, wind, flood shall be used for DOE laboratories, reservations, and production facilities."

- Executive Order 12941 "Seismic Safety of Existing Federally Owned or Leased Buildings."

- The American Institute of Steel Construction (A.I.S.C.), American Concrete Institute (A.C.I.), and Uniform Building Code (UBC) define analysis and design requirements for corrective actions.

1. Title and Location of Project: Steam Plant Wastewater Treatment Facility Upgrade
Y-12 Plant, Oak Ridge, Tennessee

2a. Project No. 97-D-124
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1997

3b. A-E Work (Titles I & II) Duration: 12 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- None
Total Project Cost (TPC) -- None

4a. Date Physical Construction Starts: 3rd Qtr. FY 1998

4b. Date Construction Ends: 4th Qtr. FY 1999

6. Current Cost Estimate:
TEC -- $ 3,600
TPC -- $ 4,100

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1997	$ 600	$ 0	$ 600	$ 500
1998	1,900	0	1,900	800
1999	1,100	0	1,100	2,300

8. Project Description, Justification, and Scope

The purpose of the project is to upgrade the existing facility with the state-of-the-art equipment to treat the wastewaters from the Steam Plant and thereby meet the discharge limits of the National Pollutant Discharge Elimination System (NPDES) permit.

This project consists of installing equipment to improve the existing process and an expansion of Building 9616-9 to accommodate the equipment. The equipment to be installed is for aeration, final pH adjustment, and filtration. The aerator will be installed in the north basin. The final pH adjustment, and the filtration equipment, complete with pumps and piping will be installed in the expanded building. Some of the existing piping will be demolished. Field instrumentation will consist of flow meters, pressure gages, level indicators, and pH indicators. A Breakroom will also be provided on the second floor of the building expansion. The expanded section of the building will have fire protection, heating, ventilation, electrical service, telephone lines and Y-12 Plant paging system.

The discharge of treated wastewaters from the Y-12 Plant, into East Fork Popular Creek (EFPC) must comply with the NPDES permit issued by the Tennessee Department of Environment and Conservation (TDEC). The NPDES permit issued is good for a period of five years, and is expected that each new permit will be more stringent than the last one. A series of NPDES permit infractions have occurred over the last few years at the Steam Plant Wastewaters Treatment Facility (SPWTF). This project, when completed, will provide the SPWTF an increased capability to comply with the NPDES permit.

1. Title and Location of Project: Steam Plant Wastewater Treatment Facility Upgrade Y-12 Plant, Oak Ridge, Tennessee (Continued)	2a. Project No. 97-D-124 2b. Construction Funded

8. Project Description, Justification, and Scope (Continued)

If no remedial action is taken and violations continue, DOE and the Y-12 Plant could receive Notices of Violation (NOV) and be subject to criminal lawsuits. At present, a lawsuit initiated by the Friends-of-the-Earth, an environmentalist group, is in progress against DOE.

The FY 1997 funds will provide for Titles I and II engineering and associated project integration activities.

9. Details of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management Costs		$ 760
(1) Engineering design and inspection at approximately 23 percent of construction costs, (Item c (Design, Drawings, and Specifications: $140,000).	$ 480	
(2) Construction management costs	150	
(3) Project management at 6 percent of construction costs (Item c).	130	
b. Land and land rights		0
c. Construction costs		2,080
1. Improvements to land	0	
2. Buildings	960	
3. Special equipment	1,090	
4. Utilities	30	
5. Demolition	0	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		160
h. Subtotal (a through g)		$ 3,000
i. Contingencies at approximately 20 percent of above costs		600
j. Total line item cost (Section 11.a.1.(a)).		$ 3,600 b/
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 3,600

10. Method of Performance

Title I and II design will be performed by an A-E. Lockheed Martin Energy Systems (LMES) will review and approve the design documents prepared by the A-E and will provide Title III field inspection and final utility connections. Procurement and construction will be performed by a fixed price subcontractor, with construction management to be provided by MK-Ferguson of Oak Ridge Company.

a/ These estimates are based on a conceptual design issued in January 1995.

b/ Applicable escalation rates are taken from the DOE Oak Ridge Field Office escalation multipliers issued August 1994. The escalation rates were based on escalation of 3.3 percent in FY 1997, 3.3 percent in FY 1998, and 3.2 percent for FY 1999 as amended.

b. Related annual costs (estimated life of project--20 to 25 years)	
1. Facility operating costs	$ 20
2. Facility maintenance and repair costs	6
3. Programmatic operating expenses directly related to the facility	0
4. Capital equipment not related to construction but related to the programmatic effort in the facility	0
5. GPP or other construction related to the programmatic effort in the facility	0
6. Utility costs	15
7. Other costs	0
Total related annual costs	$ 41

240

1. Title and Location of Project: Steam Plant Wastewater Treatment Facility Upgrade Y-12 Plant, Oak Ridge, Tennessee (Continued)	2a. Project No. 97-D-124 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project costs

1. Total facility costs
   (a) Line item -- Construction line item costs for the engineering design, procurement, demolition, and construction are estimated to be $3,600,000.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- None.
   (d) Inventories -- None.

2. Other project costs
   (a) R&D necessary to complete construction -- None.
   (b) Conceptual design -- Approximately $160,000 was incurred to develop the scope of the project.
   (c) Decontamination and Decommissioning (D&D) -- None.
   (d) NEPA documentation -- Approximately $40,000 will be incurred for NEPA determination development cost.
   (e) Other project related funding -- Approximately $300,000 will be expended on other project related items broken out as follows: design criteria, $110,000, plant support for duration of project. $20,000; startup operations, $30,000; safety documentation, $100,000; and feasibility study, systems requirement, value engineering, $20,000; site characterization, $20,000.

b. Related annual costs

1. Facility operating costs -- The associated overhead for facility operating costs will cost approximately $20,000 annually.
2. Facility maintenance and repair costs -- The annual costs for direct labor, materials and supplies, and associated overhead for maintenance and repair activity are estimated to cost approximately $6,000.
3. Programmatic operating expenses directly related to the facility -- None.
4. Capital equipment not related to construction but related to the programmatic effort of the facility -- None.
5. GPP or other construction related to the programmatic effort -- None.
6. Utility costs -- None.
7. Other Costs -- None.

1. Title and Location of Project: Sewage Treatment Quality Upgrade (STQU), Pantex Plant, Amarillo, Texas

2a. Project No. 96-D-122
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 2nd Qtr. FY 1996

3b. A-E Work (Titles I & II) Duration: 25 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $11,300
Total Project Cost (TPC) -- $12,400

4a. Date Physical Construction Starts: 2nd Qtr. FY 1998

4b. Date Construction Ends: 2nd Qtr. FY 2001

6. Current Cost Estimate:
TEC -- $ 11,300
TPC -- $ 12,400

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1996	$ 600	$ 0	$ 600	$ 250
1997	100	0	100	300
1998	6,900	0	6,900	5,700
1999	3,700	0	3,700	4,400
2000	0	0	0	500
2001	0	0	0	150

8. Project Description, Justification and Scope

The Sewage Treatment Quality Upgrade project will control and process liquid from industrial processes, stormwater runoff, and sanitary wastewater.

FY 1997 funds will be used for design, procurement and construction activities.

Waste Water Treatment System

The Waste Water Treatment System will be upgraded to meet known and anticipated environmental regulations. New effluent mechanical bar screen, flow equalization, multi-channel oxidation ditch, secondary clarification, ultra-violet light disinfection and sludge holding/stabilization will be provided.

1. Title and Location of Project: Sewage Treatment Quality Upgrade (STQU), Pantex Plant, Amarillo, Texas	2a. Project No.: 96-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

- Treatment Plant discharge will be to a natural wetland.
- Revised Texas Natural Resource Conservation Commission (TNRCC) Discharge Permit will contain the following permit limits:

Biochemical Oxygen Demand (BOD)	≤ 5 mg/l
Total Suspended Solids (TSS)	≤ 5 mg/l
Ammonia Nitrogen (NH_3N)	≤ 2 mg/l
Phosphorous (P)	≤ 1 mg/l
Dissolved Oxygen (DO)	≤ 7 mg/l
Fecal Coliform	≤ 200 counts
Total Chlorine Residual (TCR)	≤ .5 mg/l

- Effluent waste water quality is:

Flow	.65 mgd average (5/9)
	.20 mgd average (2/7)
	1.00 mgd average (future)
BOD	54 mg/l average
	100 mg/l peak
COD	104 mg/l average
	NH_3N 15 mg/l

Upgrade of the Sanitary Sewer System in Zone 12.

This upgrade will provide for the replacement of between 5,000 to 6,000 linear feet of six, eight and twelve inch sanitary sewer pipe and 27 sanitary manholes in a portion of Zone 12 of the Pantex Plant. The existing sanitary sewer consists of vitrified clay pipe and brick manholes which are approximately 50 years old. The existing system is badly deteriorated and is allowing large amounts of infiltration and exfiltration to occur. Portions of the Zone 12 sewer system have already undergone recent repair and replacement.

a. The Sewer replacement and repair limits were outlined by Pantex personnel. A limited field investigation was conducted to verify existing conditions. A survey of the existing sewer system will be conducted as part of Title I Design to determine the final scope of work.

b. Sewer elevations and profiles determined by engineering judgment and information from a previous project similar to this one.

c. Solid Waste Management Units (SWMU) were determined from information provided by Pantex personnel. During Title I, additional field investigation will accurately determine the SWMU's.

d. The percent of pipe and manholes to be repaired or replaced was made by engineering judgment. The design engineers used as a basis the adjacent similar project for replacing sanitary sewer lines.

Elimination of Industrial Discharge to Surface Ditches.

The HE contaminated waste water treatment systems at Buildings 11-20 and 11-50 will be revised to add treated water holding sumps and piping to discharge treated water to the sanitary sewer rather than to grade. A treatment system of sumps, pumps, and filtering equipment will be provided for the HE contaminated waste water at Building 12-19. The treated water from Building 12-19 will be discharged to the sanitary sewer.

8. Project Description, Justification and Scope (Continued)

A scrubber water recirculation and filtering system will be provided for the rotoclones in Building 12-19 to improve equipment performance and reduce discharge of contaminated water.

a. Burning of HE contaminated particulate filters (string and cartridge) and carbon filter material will continue to be allowed.

b. Particulate filtering followed by carbon filtering is and will continue to be adequate as a treatment technique for HE contaminated waste water.

c. No other contaminants are in the waste water streams that would either prevent burning as a means of disposal nor require other means of treatment (such as heavy metals).

d. No provisions will be made to limit storm water infiltration into the system. (Capacities have been based on storm water infiltration.)

e. Direction from Pantex personnel that "double containment" is not required in the piping and sump systems is correct.

f. All cooling water from Building 12-19 is put into the trench system or the sanitary sewer. This includes the cooling water for the Bay 13 100 gallon kettle jacket cooling and for the Bay 15 300 gallon kettle jacket cooling.

g. Additional waste stream characterization will be conducted during Title I Design.

Modify Plant Storm Water System

This upgrade will provide best management practices to control storm water runoff from existing paved parking areas within the DOE Pantex Plant. The control of storm water will prevent erosion, inhibit sediment deposition in natural waterways, and prevent the migration of possible pollutants within the storm water runoff stream.

All equipment will consider seismic loading. Seismic Zone 1 will be used per Uniform Building Code (UBC) maps. Seismic loads will be calculated in accordance with University of California Research Lab (UCRL) 15910. UCRL 15910 specifies that Important or Low Hazard Facilities be designed according to the UBC procedure for equivalent static load. UCRL 15910 specifies that site specific values be used in the UBC equation. UCRL specifies an importance factor of 1.25. UCRL refers to UCRL 53582 Revision 1 for a site specific value of the factor C in the UBC equation.

The modifications to the Storm Water System at the Pantex Plant portion of the Conceptual Design Report (CDR) were prepared with the following assumptions:

a. National Pollution Discharge Elimination System (NPDES) permit limitations will be established for the Pantex Plant. A draft permit application has been submitted by the Pantex Plant, but as of this date, no effluent limitations have been set.

b. As part of the United States Environmental Protection Agency's (EPA) requirements to implement the Clean Water Act, the Pantex Plant will be required to implement Best Management Practices (BMP's) to control contaminants from entering the plant's storm water system.

c. The BMP's presented within the CDR are based on best engineering judgements for the various runoff situations present at the Pantex Plant. Actual runoff conditions, contaminants, and NPDES requirements will be based upon the final NPDES permit.

d. Various paved parking lots throughout the Pantex Plant were identified by Pantex personnel for inclusion in a Best Management Practices Plan. These parking lots were field inspected for existing drainage patterns and structures.

1. Title and Location of Project: Sewage Treatment Quality Upgrade (STQU), Pantex Plant, Amarillo, Texas	2a. Project No.: 96-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

e. The majority of the parking lots are for Privately Owned Vehicles (POV's). As such, the contaminants that can reasonably be expected as storm water runoff are traces of oil, grease, fuel, antifreeze, and sediment. The only parking lot with the potential for a larger contaminant concentration is at the Vehicle Maintenance Facility, Building 16-1.

f. The first fifteen minutes of storm water runoff will contain the bulk of the contaminants. As a minimum, this project will filter and briefly detain the storm water runoff from the parking lots by the use of aggregate filled basins.

g. Except for the plant parking lots, the CDR does not address storm water entering the existing five playas within the Pantex Plant. The issue of the playas being considered a wetland has not been addressed.

h. Waste streams characterization for the storm water flows associated with the various drainage areas will be conducted during Title I design. This will include sampling of rainwater within the playas and sampling of storm water during rainfall events.

Discharge volumes in 1992 suggest that we are at 78 percent capacity of TNRCC Permit No. 02296 flow limits; therefore, engineering and financial investigations must commence for expansion and/or upgrading of Waste Water Treatment Facility (WWTF) and/or collection facilities (31 TAC S 305.126a & b).

a. The current method of disinfection of the WWTF effluent must be modified to meet total toxicity testing requirements. The effluent will need to be dechlorinated subsequent to chlorination prior to discharge or an alternate method of disinfecting the effluent installed. An alternate method of disinfecting may be preferable in light of the formulation of trihalomethanes which result from the chlorination process.

b. Elimination of industrial discharges to the surface storm drainage system must be accomplished in order to comply with environmental statutes and regulations.

c. Sewer lines at the Pantex Plant have been identified in the past through spot television inspections as being in poor physical condition. The specific lines that have been so identified have been replaced by recent sewage system improvement projects. However, some of the sewer lines in the northern part of Zone 12 are of the same age and construction are assumed to also to be deteriorated and requiring replacement. This suggests that replacement of these lines is appropriate.

This project will be in compliance with the following regulations.

9. Details of Cost Estimate a/ b/

	Item Cost	Total Cost
a. Design and Management Costs		$ 1,700
(1) Engineering design and inspection at approximately 9.7 percent of construction costs (Item c) (Includes PSAR/FSAR)	$ 750	
(2) Construction management at 11 percent of construction costs (Item c)	820	
(3) Project management at 1.7 percent of construction costs	130	
b. Land and land rights		0
c. Construction costs		7,700
1. Improvements to land including grading, drainage, paving, parking, fencing, lighting, pedestrian access walks	1,110	
2. Buildings (Waste Water Treatment Plant Support Buildings, Addition to Building 12-19)	3,860	
3. Special equipment	0	
4. Utilities, including electrical power, water, sanitary sewer lines, compressed air, fuel oil, condensate return lines, etc.	2,710	
5. Demolition	0	
6. M&O contractor construction support	20	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		9,400
i. Contingencies at approximately 20.2 percent of above costs		1,900
j. Total line item cost (Section 11.a.1.(a))		$ 11,300
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 11,300

a/ This estimate is based on the Conceptual Design Report, which is 100 percent complete. Total costs have been rounded to the nearest hundred thousand.

b/ Costs have been escalated as follows for each portion of the project: Building ED&I 8.980 percent (December 1996); CM/PM 15.360 percent (September 1998); Construction 14.430 percent (June 1998), Equipment (not applicable). Escalation is based on ICE/CCMD/HQ Guidelines.

1. Title and Location of Project: Sewage Treatment Quality Upgrade (STQU), Pantex Plant, Amarillo, Texas

2a. Project No.: 96-D-122
2b. Construction Funded

10. Method of Performance

Contracting arrangements are as follows: design, procurement and construction - fixed-price contract awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

Total related annual costs.	$ 1,400

247

1. Title and Location of Project: Sewage Treatment Quality Upgrade (STQU), Pantex Plant, Amarillo, Texas	2a. Project No.: 96-D-122 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item -- Narrative not required.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- None.
   (d) Inventories -- None.

The facility cost is the only direct cost related to this project. There are no operating expense funded equipment and no inventories associated with the project.

2. Other project costs
   (a) R&D necessary to complete construction -- None.
   (b) Conceptual design -- $500,000.
   (c) Decontamination and Decommissioning (D&D) -- None.
   (d) NEPA documentation -- $100,000.
   (e) Other project related funding -- Costs are engineering support for preoperational test, checkout and startup--$500,000.

b. Related annual costs

It is estimated that the facility will be used 25 years for its programmatic purpose.

1. Facility operating costs -- The major elements comprising the annual operating costs are for energy costs, labor costs, and operating costs of mechanical equipment. To operate the facility, fourteen operators on a one shift rotation will be required.
2. Facility maintenance and repair costs -- Routine maintenance will be completed by the Pantex Plant craftsmen. Maintenance and repair costs have been included.
3. Programmatic operating expenses directly related to the facility -- None.
4. Capital equipment not related to construction but related to the programmatic effort in the facility -- None.
5. GPP or other construction related to programmatic effort -- None.
6. Utility costs -- Estimated as shown.
7. Other Costs -- None.

3a. Date A-E Work Initiated (Title I Design Start Scheduled): 1st Qtr. FY 1996

3b. A-E Work (Titles I and II) Duration: 8 months

4a. Date Physical Construction Starts: 1st Qtr. FY 1997

4b. Date Construction Ends: 4th Qtr. FY 1998

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $13,600
Total Project Cost (TPC) -- $14,500

6. Current Cost Estimate:
TEC -- $13,600
TPC -- $14,500

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1996	$ 3,100	$ 0	$ 3,100	$ 2,300
1997	7,000	0	7,000	5,200
1998	3,500	0	3,500	6,100

8. Project Description, Justification and Scope

This project will eliminate the use of "ozone depleting" chlorofluorocarbons (CFCs) currently used in the refrigeration and cooling systems at the Y-12 Plant, by replacing chillers and direct expansion (DX) air conditioners with new equipment and retrofitting existing chillers, DX units, and process coolers to operate on "ozone friendly" refrigerants. It will also upgrade the ventilation systems in chiller buildings and construct a small covered storage area to store CFC refrigerants removed from the affected chillers. This refrigerant will be stockpiled for future use.

FY 1997 funds will be used for design, procurement and construction activities.

After 1995 the refrigerant used in the existing chillers will not be manufactured. After refrigerant stockpiles are depleted, these chillers cannot operate, resulting in the loss of cooling in each and every building on the system. Government procurement guidelines prohibit stockpiling of refrigerant and caps are placed on the amount of refrigerant that can be procured.

The Retrofit HVAC and Chillers for Ozone Protection project will ensure that required comfort and process cooling continues in buildings at the Y-12 Plant. Most of the cooling in Y-12 is performed by central chilled water systems utilizing chillers that operate below atmospheric pressure. These chillers utilize automatic purge units to discharge moisture and air which enters the refrigerant circuit because of the low pressure. These purge units also discharge refrigerant while purging the moisture and air. Although these chillers will be retrofitted with new high-efficiency purge units that discharge less than one-half pound of refrigerant per pound of air (existing units purge 3 pounds of refrigerant per pound of air), they will still discharge refrigerant to the atmosphere during normal operation. This project is necessary to minimize atmospheric emissions and eliminate the use of ozone depleting CFCs to insure compliance with the EPA Stratospheric Ozone Protection Amendment of the Clean Air Act, the Montreal Protocol, the Department of Energy (DOE) Order 5400.1, General Environmental Protection Program, and Title 40 of the Federal

1. Title and Location of Project: Retrofit HVAC and Chillers for Ozone Protection, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee	2a. Project No.: 96-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Regulations. The project will also comply with the Presidential Executive Order 12856 for Federal Compliance with Right-to-Know Laws and Pollution Prevention Requirements of 1993, the National Pollution Prevention Act of 1990, and the National Energy Policy Act of 1992.

9. Detail of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management Costs		$ 2,160
(1) Engineering design and inspection costs at approximately 15 percent of construction (Item c)	$ 1,355	
(2) Construction management costs	320	
(3) Project management costs	485	
b. Land and land rights		0
c. Construction costs		9,125

j. Total line item cost (Section 11.a.1.(a))		$ 13,600 b/
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 13,600

10. Method of Performance

To the extent feasible engineering will be performed under a negotiated fixed-fee architect-engineer contract. To the extent feasible construction will be accomplished with a construction manager using fixed-price subcontractors. Advanced procurement of new chillers and air conditioners (long delivery items) will be by the construction manager.

a/ These estimates are based on a conceptual design completed November 1993.
b/ Applicable escalation rates are taken from the DOE Oak Ridge Operations escalation multipliers issued October 1993. The escalation rates were based on escalation of 3.4 percent in FY 1996 and 3.3 percent after FY 1996.

1. Title and Location of Project: Retrofit HVAC and Chillers for Ozone Protection, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee	2a. Project No.: 96-D-123 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- Costs for the design, procurement, and construction to retrofit HVAC systems and chillers for ozone protection are estimated to be $13,600,000.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- None.
      (b) Conceptual design -- The conceptual design was completed November 1993 at a cost of $195,000.
      (c) Decontamination & Decommissioning (D&D) -- None.
      (d) NEPA documentation -- Cost of 1994 categorical exclusion (CX) preparation $5,000.
      (e) Other project related costs -- Engineering and operational support activities for Y-12 Plant functions during design and construction will cost approximately $700,000.
      (f) Start-up costs -- None.

b. Related annual costs
   1. Facility operating costs -- Includes utilities personnel 3 shifts are approximately $500,000.
   2. Facility maintenance and repair costs -- Keep chillers and HVAC equipment operational are approximately $600,000.
   3. Programmatic operating expenses directly related to facility materials (Programmatic Support) -- None.
   4. Capital equipment not related to construction but related to the programmatic effort in the facility -- Capital equipment to install high efficiency purge units and prevac heaters on existing chiller units will cost approximately $950,000. This equipment will reduce refrigerant leakage from existing chillers are an interim corrective action until line item is funded.
   5. GPP or other construction related to the programmatic effort in the facility -- None.
   6. Utility costs -- Electricity costs approximately $4,600,000 to operate the chillers and HVAC equipment.
   7. Other costs -- None.

1998	6,900	0	6,900	8,600

8. Project Description, Justification and Scope

This project will address upgrades to the existing Oak Ridge Y-12 Plant sanitary sewer system. The objective of the project is to repair known system deficiencies, which have resulted in outages and stoppages, sanitary waste water pollution entering the storm sewer system and East Fork Poplar Creek (EFPC), and a steadily increasing amount of surface water and ground water entering the sanitary system by inflow and infiltration. This project is infrastructure related and will be required regardless of the future missions at the Y-12 Plant. Upgrades will be comprised of (1) relining cracked pipe sections and joints, (2) replacing sewer pipe and joints too damaged for relining, (3) replacing the existing 8-inch-diameter outfall line on the west end with a 12-inch-diameter line, (4) rehabilitating deteriorated manholes by extending sealing manhole walls or by use of other repair approaches, (5) constructing a new pump station to replace an existing undersized pump station adjacent to an Material Access Area (MAA), (6) decommissioning a second existing pump station and installing an 18-inch-diameter outfall line to gravity drain flow from the western portion of the plant to the municipal system, and (7) removing cross-connections between the sanitary sewer system and storm sewer system.

FY 1997 funds will be used for design, procurement and construction activities.

The project is needed for several reasons. First, as a result of the present sanitary sewer system deficiencies (particularly blocked piping and pump station breakdowns), overflows of waste water periodically occur into Y-12 Plant building plumbing services, causing disruptions of operations in both radiological and nonradiological areas. This project will correct these deficiencies, thereby preventing the overflows and subsequent disruptions. Second, due to piping and manhole deficiencies, surface water and ground water enter the sanitary sewer system and is conveyed to the City of Oak Ridge treatment system. The entry of such waters into the system represents a noncompliance with the city's sewer use ordinance, which prohibits such discharges into the system. This project will prevent surface water and ground water inflows into the

1. Title and Location of Project: Sanitary Sewer Upgrade Oak Ridge Y-12 Plant, Oak Ridge, Tennessee (Continued)	2a. Project No.: 95-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

system by performing piping and manhole repairs. Third, cross-connections exist between the sanitary sewage system and storm sewer system, which results in pollution from the sanitary sewage system entering the storm sewer system and into EFPC. This unauthorized bypass of the sewage system into EFPC, which is in violation of the CWA, will be addressed in the project by the elimination of the cross-connections. Fourth, sanitary sewer lines, particularly those in the western half of the Y-12 Plant, are operating at their capacity and, hence, are inadequate to handle expected additional sanitary waste water flows from ongoing facility construction. The proposed sewer upgrade project will replace affected lines with larger piping to support the ongoing facility construction.

The scope of the project consists of repairing approximately 300 manholes, lining over 3,400 linear feet of existing vitrified clay lines, replacing approximately 8,500 linear feet of existing pipe, including replacing approximately 6,000 linear feet of existing 8-inch-diameter outfall line in the west end with new 12-inch-diameter line, decommissioning one pump station and relocating a second pump station, installing approximately 2,900 linear feet of pipe for the 18-inch-diameter outfall line, and eliminating cross-connections between the sanitary sewer system and storm sewer system.

9. Detail of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management Costs		$ 4,700
(1) Engineering design and inspection at approximately 14 percent of construction costs, (Item c)	$ 2,300	
(2) Construction management costs at approximately 9 percent of construction costs	1,500	
(3) Project management at approximately 5 percent of construction costs	900	
b. Land and land rights		0
c. Construction costs		16,500
1. Improvements to land	0	
2. Buildings	0	
3. Special equipment	0	
4. Utilities	16,500	
5. Demolition	0	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		200
h. Subtotal (a through g)		$21,400
i. Contingencies at approximately 22.9 percent of above costs		4,900
j. Total line item cost (Section 11.a.1.(a))		$26,300 b/
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$26,300

a/ These estimates are based on a conceptual design completed in February 1993.
b/ Applicable escalation rates are taken from the DOE Oak Ridge Field Office escalation multipliers issued October 1993. The escalation rates were based on escalation of 3.3 percent in FY 1995, 3.4 percent in FY 1996, and 3.3 percent in FY 1997, and 3.3 percent in FY 1998.

10. Method of Performance

To the extent feasible, engineering will be performed under a negotiated architect-engineer contract. To the extent feasible, construction and procurement will be accomplished with a construction manager using fixed-price subcontractors.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	FY 1998	Total

12. Narrative Explanation of Total Project Funding and Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line Item -- Construction line item costs for the engineering design, procurement, demolition, and construction to replace the Y-12 sanitary sewer system are estimated to be $26,300,000.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- None.
   (d) Inventories -- None.

2. Other project costs
   (a) R&D necessary to complete construction -- None.
   (b) Conceptual design -- Approximately $480,000 were incurred to develop the scope of the project.
   (c) Decontamination and decommissioning (D&D) -- None.
   (d) NEPA documentation -- Approximately $25,000 were incurred to develop NEPA documentation.
   (e) Other project related funding -- Engineering and operational support activities for Y-12 Plant functions before and during design and construction of approximately $995,000.

b. Related annual costs

1. Facility operating costs -- Approximately $150,000 for facility operating costs.
2. Facility maintenance and repair costs -- Approximately $150,000 for maintenance and repair costs.
3. Programmatic operating expenses directly related to the facility -- None.
4. Capital equipment not related to construction but related to the programmatic effort in the facility -- None.
5. GPP or other construction related to the programmatic effort in the facility -- None.
6. Utility costs -- None.
7. Other costs -- None.

1. Title and Location of Project: Hydrogen Fluoride Supply System, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee	2a. Project No. 94-D-124 2b. Construction Funded

SIGNIFICANT CHANGES

- The construction start date was changed from 1st Qtr. FY 1995 to 4th Qtr. FY 1995 per BCP 64/HF-05. The reason for change is due to the delays in preparation and approval of the environmental documentation (Environmental Assessment and Finding of No Significant Impact) for the project.

1999	0	0	0	200

8. Project Description, Justification and Scope

The scope of this project is to provide replacement anhydrous fluoride (ANF) supply and fluidbeds facilities, both of which are part of the existing enriched uranium recycle and conversion facilities in the Oak Ridge Y-12 Plant. The hydrogen fluoride (HF) facility, fluidbeds, and reconfigured HF supply system will be located on the east side of 9212 building adjacent to the existing HF dock. This configuration will allow elimination of the documentation and demolition of existing 9812 building because of overlapping footprints between the proposed facility and the existing facility. The HF Facility will be enclosed in three process modules which will contain all potential HF releases. The replacement fluidbeds will be located in the east end of existing B-1 Wing of the 9212 building which will be remodeled for this function. The new HF supply system and the fluidbeds will be designed to be operated remotely as current technology permits.

The new HF system will include new hydrogen fluoride cylinder handling, vaporization and delivery piping systems, cylinder and vaporizer containment modules, automated control and leak detection system; and an HF pressure relief, fugitive emissions, and emergency release collection and treatment system module. ANF is one of the most acidic substances known and does not biodegrade when released in water, in air, or on land. It must be buffered, diluted, or reacted to reduce its acidity. Exposure to an air concentration of 30 parts per million can be immediately dangerous to life and health and, even in lower air concentration, can produce severe irritation to the eyes, skin, and respiratory system. HF will be received at the existing HF dock in vendor-owned cylinders and trucks. The fluidbeds facility, which converts

1. Title and Location of Project: Hydrogen Fluoride Supply System, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee (Continued)	2a. Project Number: 94-D-124 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

uranium oxide to fluoride, will include the installation of reduction and hydrofluorination fluidbed vessels, supporting facilities, vessel off-gas treatment system, transfer system, and process exhaust systems. The new HF supply system will utilize an existing dock on the east side of the existing enriched uranium recycle facility. This site is adjacent to the existing HF supply facility. The new facility will utilize existing HF treatment solution, (potassium hydroxide (KOH), storage tanks and their tanker stations. The new fluidbed system will be constructed in the east portion of building 9212 B-1 Wing. The project includes demolition of the existing area including a mezzanine, partitions, stairways, miscellaneous structures, and the resulting containerization and disposal of contaminated waste on a Y-12 Plant site interim waste storage pad.

Failure to complete this project will continue the risk of unacceptable HF exposures to the public, worker population, and the operators, with the latter bearing an additional risk of uranium particulate inhalation exposure. In addition, failure to fund this project would jeopardize continued operation of the HF supply and fluidbeds facilities, and, thereby, the only DOE complex highly enriched uranium conversion and recycle complex.

A major release of HF is the Y-12 Plant's greatest hazard, other than a nuclear criticality. The proposed new HF facility replaces an existing, essentially open-air cylinder unloading and vaporization dock which is operated in a "hands on" manner. The existing dock does not have fugitive and purging emission treatment capability, nor is it capable of dealing with a major release caused by a severe natural phenomena event. The new facility is required to sufficiently reduce the risk of an unacceptable exposure to the operator, the worker population, the public, and reduce the risk of an associated detrimental environmental impact.

The fluidbeds facility, where the HF is reacted with uranium oxide, was constructed more than 30 years ago. The age of this facility is making it increasingly difficult to maintain compliance with current and anticipated contamination control, safety, and regulatory requirements. The major improvements required can most efficiently be achieved by total replacement. Design features of the new facility will dramatically reduce the risk of HF and uranium particulate exposures to the operators. The proposed replacement facilities will assure the capability of highly enriched uranium metal production for the long term or until a totally new uranium weapons production capability (complex 21) can be constructed and is operable. (The replacement of these facilities would result in the entire uranium processing complex at Y-12 being for the most part either replaced or modernized.)

The highly enriched uranium chemical recovery and recycle process continues to be necessary and a unique Y-12 capacity to fulfill the following missions: (1) maintaining nuclear competence and providing requested specification grade uranium for weapons component fabrication and other special needs; (2) providing conversion capability of uranium salvage from retired weapons to alternate forms (such as metal or oxide) which are more readily accountable and allow safe storage from a health physics and criticality safety standpoint; (3) serving as a national repository for highly enriched uranium and, therefore, having the conversion capability to economic, safe, and accountable uranium forms for long-term storage.

FY 1997 funds will be used to complete the procurement of the modules, complete site preparation, demolition and modifications, and begin facility utility upgrades and support construction management and Title III inspection services.

1. Title and Location of Project: Hydrogen Fluoride Supply System, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee (Continued)

2a. Project Number: 94-D-124
2b. Construction Funded

9. Detail of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 5,360
(1) Engineering, design and inspection at approximately 30% of construction costs (Item c)	$ 4,870	
(2) Construction management costs	40	
(3) Project management at 3 percent of construction costs (Item c)	450	
b. Land and land rights		0
c. Construction costs		16,390
1. Improvements to land	$ 250	
2. Buildings	4,400	
3. Special equipment	11,380	
4. Utilities	0

6. Demolition	0	
d. Standard equipment	0	
e. Major computer items	0	
f. Removal cost less salvage	0	
g. Design and project liaison, testing, checkouts and acceptance		510
h. Subtotal (a through g)		$ 22,260
i. Contingencies at approximately 18.1 percent of above costs		4,040
j. Total line item cost (Section 11.a.1.(a))		$ 26,300
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 26,300

10. Method of Performance

Engineering will be performed under one negotiated architect-engineer contract (demolition and utilities and facility modifications) and Lockheed Martin Energy Systems (LMES) cost plus award fee (CPAF) contract for engineering of the special process flow sheets and module designs for the new systems. Construction of the new HF and fluidbed systems, including demolition activities, will be accomplished by the construction manager's direct-hire (CPAF) forces due to contamination and close proximity of fissile material access areas and ongoing operations. An interim storage pad for 8-25 boxes will be constructed by a fixed-price subcontractor.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line Item -- Costs for the Engineering Design, Procurement, Demolition, and Construction of the HF Supply System are Estimated at $26,300,000.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- Costs will not be required.
      (b) Conceptual design and Site characterization costs -- $375,000 have been incurred to develop the original scope of the project and to improve the project cost and schedule estimates.
      (c) Decontamination and Decommissioning (D&D) -- None.
      (d) Design criteria -- Approximately $170,000 will be expended.
      (e) Safety documentation costs -- Approximately $50,000 will be incurred to prepare safety analysis.
      (f) NEPA Documentation -- Approximately $50,000 will be expended.
      (g) Other project related funding -- Approximately $1,875,000 will be expended. It is broken out as follows: Plant Support for duration of project, $800,000; Startup Operations, $585,000; and Feasibility Study, Systems Requirement, Value Engineering, $445,000. Site Characterization, $45,000.

b. Related annual costs (estimated life of project--30 years)

   1. Facility operating costs -- The utilities, maintenance and materials, and associated overhead for facility operating costs will cost approximately $20,000 annually.
   2. Facility maintenance and repair costs -- The annual costs for direct labor, materials and supplies, and associated overhead for maintenance and repair activity are estimated to cost approximately $960,000.
   3. Programmatic operating expenses directly related to the facility -- None.
   4. Capital equipment not related to construction but related to the programmatic effort in the facility -- None.
   5. GPP or other construction related to the programmatic effort in the facility -- None.
   6. Utility costs -- None.
   7. Other Costs -- None.

6. Current Cost Estimate:
TEC -- $14,700
TPC -- $16,000

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1994	$ 1,000	$ 0	$ 1,000	$ 16
1995	1,000	0	1,000	813
1996	5,500	0	5,500	4,271
1997	5,200	0	5,200	6,600
1998	2,000	0	2,000	3,000

8. Project Description, Justification and Scope

The Main Manufacturing Building and the Electrical Products Manufacturing Building of the Kansas City Plant (KCP) include approximately 2.3 million square feet and have an occupancy of approximately 4,000 personnel. This project is necessary to meet the intent of DOE Order 5480.7A, "Fire Protection," DOE Order 6430.1B, "General Design Criteria," and National Fire Protection Association (NFPA) 101, "Life Safety Code" standards. Among the upgrades that this project will provide are fire-rated separations which create exit enclosures in the main manufacturing and office buildings to allow personnel to safely evacuate the premises in case of a fire or other emergency. Modifications to existing walls and penetrations are included to provide fire-rated separations between office floors. Construction of horizontal exits and protected paths of travel to meet the required number of exits for office and factory personnel, and construction of fire-rated enclosures through the front office building to the outside are included. The project also includes modifications and upgrades to air handling units and ducts that provide air to exit passageways for the factory floor and in the basement. Further, this project will provide the necessary construction to upgrade existing walls and penetrations to meet the required fire-resistance rating for horizontal exits.

FY 1997 funds will be used for design, procurement and construction activities.

1. Title and Location of Project, Upgrade Life Safety, Kansas City Plant, Kansas City, Missouri (Continued)	2a. Project No: 94-D-125 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The project will consist of the following work elements:

1. Direct Exterior Exits
2. Additional Exit Capacity
3. Exits Within 250 Feet Travel Distance
4. Second Exit
5. Upgrade Second Exit
6. Eliminate Dead End Corridors
7. Upgrade Existing Exit Enclosures
8. Exit Smoke Protection
9. Unobstructed Exit Access
10. Vertical Opening Protection
11. Upgrade Horizontal Exits
12. 50 percent Exits - First Floor Discharge
13. Redundant Sprinkler Supply
14. Plenum Sprinklers
15. Separate Hose Reels

Deficiencies in life safety enclosures, exits, and air handling systems have been identified within the KCP main offices, manufacturing plant, and basement areas during the past several years. The lack of fire-rated separations and excessive travel distance to an exit from areas in the main facility per NFPA 101, Life Safety Code, 1991 Edition, Section 5-6, have been identified. Many deficiencies have been corrected as individual construction projects were completed; however, some aisle separations, exits, and air handling upgrades still require completion in areas where construction projects are not anticipated; therefore, this stand-alone project has been identified to correct these deficiencies.

Fire-rated separation for aisles needed as exit enclosures is necessary to meet the intent of DOE Order 5480.7A, "Fire Protection," DOE Order 6430.1B, "General Design Criteria," NFPA 101, "Life Safety Code," and Uniform Building Code (Chapter 33). Presently, air conditioning systems in the basement utilize exit enclosures for air supply and exhaust. Under a fire condition, this arrangement would allow smoke to enter the exit enclosure and prevent the enclosure from being used as an exit. Exit enclosures from which escape is to be made must be provided with fire-resistance-rated walls, floors, doors, or other means to provide occupants a protected path to the exterior of the building. Exit enclosures are not to be used as part of an air supply, return, or exhaust system serving other areas of the building. NFPA 101 and OSHA (Title 29, Part 1910) requirements are not met by existing conditions. Loss of life could result without appropriate protection. This project will provide the necessary construction to meet the intent of DOE Orders 5480.7A and 6430.1B that no fire will result in threats to the public health or in undue exposure of personnel. The July 1991 Headquarters Life Safety Appraisal recommends completion of the improvements of this project.

This project is in accordance with current mission needs, and is being coordinated with the Nonnuclear Reconfiguration project.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
(a) Line item -- construction line item costs for design, procurement, and construction at approximately $14,700,000.
(b) PE&D -- None.
(c) Operating expense funded equipment -- None.
(d) Inventories -- None.

2. Other project costs
(a) R&D necessary to complete construction -- None.
(b) Conceptual design -- A conceptual design report was completed in October 1991 at an estimated preparation cost of $100,000.
(c) Decontamination & Decommissioning (D&D) -- No narrative required.
(d) NEPA documentation -- No narrative required.
(e) Other project related funding -- Approximately $1,200,000 will be expended to develop appropriate documentation.

1. Title and Location of Project: Emergency Notification System Pantex Plant, Amarillo, Texas	2a. Project No. 94-D-127 2b. Construction Funded

SIGNIFICANT CHANGES

- The pocket pagers were deleted from this project in BCP AL95001 because the requirement was met by other means at the site.
- The start and completion dates were changed by BCP AL95001 because of a delay in awarding the A/E contract. The A/E contractor took more time than scheduled to obtain appropriate security clearances for workers.
- There was no change to the TEC or TPC because of increased cost for ED&I.

4b. Date Construction Ends: 4th Qtr. FY 1998

6. Current cost estimate:
TEC -- $6,200
TPC -- $6,400

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1994	$ 1,000	$ 0	$ 1,000	$ 0
1995	1,000	0	1,000	302
1996	2,000	0	2,000	2,798
1997	2,200	0	2,200	2,400
1998	0	0	0	700

8. Project Description, Justification and Scope

This project consists of the design and installation of an Emergency Preparedness Notification System (EPNS) which replaces headend amplifiers and associated equipment, remote amplifiers and public address (PA) speakers located throughout the Pantex Plant, and upgrading of the audio integrity of the PA System throughout the Plant. EPNS will also upgrade the outdated Outdoor Warning System (OWS).

Both the primary and the backup frontend amplifiers will be replaced with state-of-the-art PA system amplifiers with the capability for voice, music or prerecorded message inputs and automatic switchover from one amplifier to the other in case of failure. The prerecorded emergency messages can then be transmitted to plant personnel in the event of an accident. The emergency prerecorded messages could also be utilized to provide emergency instructions and keep plant personnel informed while emergency personnel in the Emergency Operations Center (EOC) prepare to deal with the crisis.

The existing 10 power amplifiers located around the plant will be replaced and additional amplifiers are anticipated to power additional PA speakers. Additional PA speakers will be installed throughout the Plant and most of the existing speakers will be replaced to improve the tonal quality and area coverage. Much of the existing wiring will be replaced, both for the low level signal to the power amplifiers and from the power amplifiers to the speakers.

The audio integrity of the current PA system is substandard. If an announcement is made by a person who speaks softly into the telephone, the audio output to the speakers is low and may not be heard. On the other hand, if the announcer speaks loudly into the telephone, the speakers are driven hard and will either be too loud for the coverage area or garbled and not understandable. The new system will automatically adjust

1. Title and Location of Project: Emergency Notification System Pantex Plant, Amarillo, Texas (Continued)	2a. Project No: 94-D-127 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

and equalize the input level. Also, acoustical treatments may need to be installed in several areas of the operating facilities. Evaluation will be made during design to determine the extent of acoustical modifications to be performed.

The OWS currently consists of one centrally located siren which is not audible to all areas of the Plant. It will be replaced with omnidirectional sirens located throughout the Plant and will include the appropriate power, remote controllers and a central station controller.

There are no security and safeguards related items in this project; however, there would be direct benefits to security in a crisis.

The PA system is the only means of mass communications at the Pantex Plant and is essential to notify Plant employees and visiting personnel of impending and/or existing emergency situations. It is utilized to inform and distribute supplemental information after activation of the Plant's emergency evacuation alarms. Announcements made on the PA system include: suspension of assembly/disassembly operations involving static sensitive electro-explosive components during active lightning conditions or the threat of lightning; emergency announcements concerning explosions, fire, radiation release, and severe weather such as tornadoes, hail, high winds, blizzard conditions, etc.; building evacuations for fire and radiation drills; suspension of outside operations involving explosives such as the firing sites and burning grounds; security exercises and actual emergencies; and the Emergency Operation Center exercises. It is also used for signaling personnel to start and stop work. It is imperative that employees and visiting personnel be kept apprised of emergency conditions and that they are notified immediately of the need for evacuation and what Plant buildings/areas to avoid during the evacuation. A storm in 1989 removed the roof from one of the temporary office trailers resulting in damage to personal vehicles and the building's contents. One employee was in the trailer at the time and was unaware of the storm situation due to the inability to hear the emergency notification. The present system does not allow compliance with Pantex Emergency Preparedness Procedures (EPP) 1001 Manual "Pantex Plant Personal Accountability Procedures" for personnel accountability; or EPP 1002 Manual "Pantex Plant Emergency Notification Procedures, Vol 1, and EPP 1003 Manual "Pantex Plant Emergency Notification Procedures, Vol II, for recall of Emergency Cadre personnel, as directed by the DOE 5500 series of orders.

The PA system is the primary method of notification and serves as the "Employee Alarm System" as prescribed by the Occupational Safety and Health Act (OSHA).

The original PA system was installed in 1952 and upgraded in 1971 to a battery-operated remote power amplifier system. The PA system was upgraded again in 1983 to add zone paging, which was accomplish through the existing telephone exchange equipment. No additional remote power amplifiers were added with the installation of zone paging. The original headend amplifier and associated equipment will be over twenty years old in 1992. In addition, many of the parts for the original headend amplifier are obsolete and no longer available. This makes repair of the amplifier almost impossible. A backup headend amplifier is located in the Computer Center Building in another part of the Plant. In the event the main headend amplifier fails and cannot be repaired, the backup amplifier can be connected to the PA system, but even this addition does not guarantee the PA system will remain operational over the coming years. The new solid state headend amplifier will replace the original amplifiers. With the implementation of this project, automatic switchover equipment will be installed to switch from the main headend amplifier to the backup headend amplifier in the event the main amplifier should fail.

Replacement cabling is required between Zones 11 and 12, the Development and Production Zones, and some replacement cable is required within the operating buildings. In addition to the partial replacement of existing cabling, the existing cabling needs to be documented as to cable routing and cable pairs used to transmit the PA signal to the speakers.

The equipment to equalize the input level and compress the frequency of the input signal will give each amplifier the same input level and frequency range, so that the amplifiers will output the same audio level and frequency range to all the paging speakers. During the Plant-wide survey, acoustical evaluations will be necessary in some operating areas as well as the adjustment of individual speakers to an optimum

1. Title and Location of Project: Emergency Notification System Pantex Plant, Amarillo, Texas (Continued)	2a. Project No: 94-D-127 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

output level for the area served. The ability to understand announcements in some processing areas is greatly hampered by the high reverberation characteristics. An economic analysis will determine the optimum of acoustical treatments and speaker level/coverage.

The OWS primary use is for emergency notification of Plant personnel of severe weather warnings (tornado, thunderstorm) and civil defense occurrences such as attacks upon the USA. The existing single OWS siren was installed in the early 1950s and has outlived its useful life. The central wiring has experienced numerous faults which have caused false alerts and general disregard for its use. Due to facility expansions in the last 30 plus years and modern facility construction techniques utilizing earth covered, heavy concrete construction, and energy efficient materials, many areas of the Plant's production and outlying areas do not have adequate coverage or are not covered by the PA system.

The project is scoped to provide voice annunciation of emergency situations by PA for personnel in ramps, buildings, or offices. The OWS is to get the attention of all Plant personnel for weather, "civil defense" situations, or alert them to contact their supervisor.

The FY 1997 funding will be used for completion of Title III engineering services and construction.

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 1,115
(1) Engineering design and inspection at approximately 14.3 percent of construction costs, Item c (Design, Drawings, and Specifications)	$ 565	
(2) Construction management costs	110	
(3) Project management at 11 percent of construction costs	440	
b. Land and land rights		0
c. Construction costs		3,935
1. Improvements to land	$ 0	
2. Buildings	3,110	
3. Special equipment	330	
4. Utilities	495

j. Total line item cost (Section 11.a.1.(a))		$ 6,200
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 6,200

270

10. Method of Performance

The project is to be accomplished as follows:

a. The design services (Titles I, II, and partial Title III) will be accomplished by an outside A-E firm under a fixed-price, lump-sum contract that will be administered by the Department of Energy (DOE) or the Operating Contractor (Mason & Hanger-Silas Mason Co., Inc.).
b. The construction services of this project will be performed by a "Q" cleared outside construction contractor operating under a fixed-price, lump-sum contract to be awarded on the basis of competitive bids. This contract may be administered by DOE, Corps of Engineers (USACE) or the Operating Contractor.
c. Construction Management Services may be performed by the Corps of Engineers, DOE, Operating Contractor or by a construction management firm under contract to DOE or the Operating Contractor.
d. Final connections for specific communications equipment will be accomplished by the operating contractor. All equipment not specified to be procured and/or installed by the construction contractor will be procured and/or installed by the operating contractor (Mason & Hanger-Silas Mason Co., Inc.).

11. Schedule of Project Funding and Other Related Funding Requirements

Pantex Plant, Amarillo, Texas

2a. Project No.: 94-D-128
2b. Construction Funded

3a. Date A-E Work Initiated (Title I Design Start Scheduled): 2nd Qtr. FY 1994

3b. A-E Work (Titles I and II) Duration: 19 months

4a. Date Physical Construction Starts: 1st Qtr. FY 1996

4b. Date Construction Ends: TBD

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $8,800
Total Project Cost (TPC) -- $9,250

6. Current Cost Estimate:
TEC -- $8,800
TPC -- $9,250

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1994	$ 800	$ 0	$ 800	$ 4
1995	1,000	0	1,000	548
1996	4,000	0	4,000	0
1997	0	0	0	3,748
1998	3,000	0	3,000	4,500

8. Project Description, Justification and Scope

This project provides for the design and construction of a new Environmental Safety and Health Analytical Laboratory (ESHAL). The proposed facility will replace and upgrade the capabilities of the existing chemistry laboratory which is outdated and ill-equipped to serve the needs and responsibilities of chemical analysis for plant materials. The facility will: (a) provide chemical analysis of plant materials and conduct surveillance evaluations on commercially procured weapons materials; and (b) provide environmental testing laboratories which will allow for the onsite testing of environmental samples applicable to the Resource Conservation and Recovery Act (RCRA) and the Environmental Protection Agency (EPA). Instrumentation and equipment will be provided to maintain and extend plant capabilities with respect to expected future accuracies and precision.

FY 1997 funding is not requested because the project is on hold pending the results of an ongoing Inspector General (IG) audit. If the project is cancelled as a result of the IG audit, the project will be closed out and all remaining funds deobligated. If the project is approved for continuation, funding will be requested for FY 1998. In either case, a Baseline Change Proposal (BCP) will be prepared to document the changes.

The site for the new facility is in the explosive development Zone 11 of the Pantex Plant and has been coordinated with the Pantex Site Development Plan. The building will be located northeast of and adjacent to the existing Weapons Material Development Analytical Laboratory in an effort to consolidate laboratory functions at Pantex Plant. An enclosed connecting ramp will tie this new facility to the existing laboratory. This will allow for shared access, including access to new analytical equipment and utilization of common areas such as the shower/change rooms.

1. Title and Location of Project: Environmental Safety and Health Analytical Laboratory
Pantex Plant, Amarillo, Texas (Continued)

2a. Project No.: 94-D-128
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The ESHAL will be a single story structure with approximately 16,400 gross square feet (13,000 net square feet). The facility will be configured into operational areas and support areas based on function and relationship of activities. Separate interior rooms will be provided for mechanical equipment and electrical equipment. All operational areas of the laboratory will have an overall positive pressure provided by the mechanical systems.

The design of this facility will be in accordance with the DOE Explosives Safety Manual (DOE/EV/06194-4) and DOE Order 6430.1A for Class II operations and laboratory scale explosive operations (less than 500 grams). High explosives design load limits will be 25 pounds hardened area, but handling of individual containers will be limited to less than 500 grams.

The ESHAL is projected to have a full-time staff of 20, working a straight daytime shift, Monday through Friday.

A major portion of the site work will consist of grading, paving (roads and parking), utility and storm drainage work. Utilities to be connected to this facility include water (fire and domestic), steam, sewer and electricity. Fire alarm, communication, mechanical and electrical systems will also be provided for building operations. Conditioned electrical power will be supplied for designated analytical equipment. Special ventilation will be provided for the chemical staging area and dust collectors will be supplied for the ventilation system in the explosives area. Each laboratory will have individual temperature control.

An area is provided in the facility for the staging of chemicals to be used throughout the facility. This area will contain ventilation systems, fire protection systems, secondary containment systems and emergency shower and eyewash in accordance with applicable provisions of DOE Order 6430.1A, National Fire Protection Act 30 (NFPA), and the Occupational Safety and Health Act (OSHA)/Texas Administrative code.

Environmental Considerations: All emissions from this facility will meet the requirements of the State of Texas, the Clean Air Act, Clean Water Act and the RCRA. The project will be managed to ensure continued compliance with the provisions and requirements of the Texas Air Control Board and the Texas Water Commission (TWC). Accommodation sites for laboratory generated contaminated waste will be designed in accordance with TWC and EPA requirements. Equipment installation will comply with all required operational safety requirements.

Safety Considerations: The building will be sited a distance greater than or equal to a minimum inhabited building distance from other explosive buildings in accordance with DOE Explosive Safety Manual DOE/EV/06194-4. Fire protection will be provided by a wet-pipe automatic sprinkler system throughout the building. Automatic and manual fire alarms will transmit digital electronic coded signals to the fire station via the Plant Fire Alarm System.

Security Considerations: Protection of classified matter in the facility will comply with DOE Order 5632.5. Unclassified computer systems will comply with DOE Order 1360.2B and classified computer systems will comply with DOE Order 5639.6.

Demolition of the existing laboratory facility, three support facilities and two connecting ramps are included in this project. (Buildings 12-8, 12-38, 12-59, 12-59E, 12-R-8, and 12-R-59). A Solid Waste Management Unit (SWMU) has been identified next to the existing laboratory, but does not impact construction of the ESHAL. An identified SWMU in the vicinity of the proposed site for the new laboratory should be a sufficient distance from the site so as not to impact construction of the ESHAL. However, the Corps of Engineers will continue an assessment of the area and any environmental issues which may evolve will be addressed.

Between April 1988 and October 1989, four audits were performed on the existing laboratory facility. These audits consisted of a Pantex Industrial Safety Department audit, a Pantex Fire Department audit, Pantex's Environmental Safety and Health Staff audit, and the DOE/HQ Tiger Team Environmental Safety and Health Assessment. The major finding was several instances of incompatible chemical staging. Presently, crowding in the chemical staging area of the current laboratory precludes adequate segregation recommended for laboratories and is not in conformance with 40 CFR 264.175.

275

1. Title and Location of Project: Environmental Safety and Health Analytical Laboratory Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 94-D-128 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Additional liquid-effluent sampling was initiated as a result of draft Section 3008(h) of the Administrative Order of Consent to Pantex Plant, issued by EPA Region 6 on September 7, 1989. One of the interim measures contained within the final terms of the Order drives the sampling of discharges from three operating buildings. The effluent sampling program has been expanded beyond the regulatory requirements under DOE Order 5400.1 which requires the following:

- verification of compliance with Federal, State and local effluent regulations and DOE Orders
- determination of compliance with commitments
- evaluation of the effectiveness of effluent treatment and control
- identification of potential environmental problems
- support of permit revision and/or reissuance
- detection, characterization, and reporting unplanned releases

The DOE Amarillo Area Office Notice AAO-93-1 (dated 10-14-92) re: "Protection of Plant Employees, the Public, and Environment" defines the policies and expectations for Environmental Protection where the operating contractor is expected to conduct a comprehensive environmental monitoring program that will provide early warning of any environmental upset condition. This program must also provide high quality, validated environmental data to meet reporting and assessment needs of the DOE, the Environmental Protection Agency (EPA), State regulatory agencies, and the public."

The present chemical laboratory performs some analyses for the current environmental monitoring plan, but does not have enough work space or sufficient sample staging areas to serve the needs for today or the increasing needs of the future. In recent years, a combination of new instrumentation and increased workload has had several impacts on the effectiveness of the current laboratory. First, the increased equipment has reduced the bench space by over 70 percent from 1400 square fee to 400 square feet. This reduction has forced crowding on the remaining bench space. In addition, the increased equipment has created problems with temperature and environmental controls in the laboratories which make it impossible in some cases to meet the rigid specifications called out by the design laboratories.

In addition to environmental monitoring, containerized hazardous waste must be analyzed for "knowledge of its contents" and for documentation on the transportation manifest in accordance with 40 CFR 262. Offsite laboratories are presently used to analyze most environmental and waste samples. However, these laboratories cannot respond quickly to our needs since up to thirty days are normally required for analytical results.

Onsite analytical capability will allow a rapid turn-around time for waste, soil, and water samples. Also, Pantex procedural and quality assurance recommendations have been made and accepted by the Texas Air Control Board. Additionally, an offsite laboratory which can analyze water or soil for the most common explosive used at the plant does not exist. The Pantex Plant has eighty waste streams which are characterized completely once a year in an effort to reclassify streams which may have a reduced number of cumulative wastes. This waste management activity is in addition to the analyses required for each containerized waste shipment that is tested for the specific hazard(s) at hand. Finally, stringent DOE auditing criteria are in place on site but limited at offsite laboratories.

The scope of the project includes the current analytical chemistry support for weapons and plant activities and the testing of facility discharges, playas, ground water, and ditches. The scope also includes analytical chemistry support for containerized waste and annual characterization of waste streams. Analyses in support of environmental monitoring and waste management will be conducted in the ESH&L in addition to analytical work currently performed in the chemical laboratory.

As a consequence of the proposed laboratory, all chemical functions (including quality control, compatibility, and process labs) will be consolidated to one location at the plant site.

9. Detail of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 1,855
1. Engineering design and inspection at approximately 24.0 percent of construction (Item c)	$ 959	
2. Construction management	391	
3. Project management	505	
b. Land and land rights		0
c. Construction costs		3,930
1. Improvements to land	135	
2. Buildings ($212/square foot)	3,490	
3. Special equipment	0	
4. Utilities	305	
5. Demolition	0	
d. Standard Equipment		1,480
e. Major computer items		0
f. Removal cost less salvage		355
g. Design and project liaison, testing, checkout, and acceptance		0
h. Subtotal (a through g)		$ 7,620
i. Contingency at approximately 15.5 percent of above costs.		1,180
j. Total line item cost (Section 11.a.1.(a))		$ 8,800
k. LESS: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 8,800

10. Method of Performance

The design services (Titles I, II, and partial Title III) will be accomplished by an outside A-E firm and will be administered by DOE or the Operating Contractor (Mason & Hanger-Silas Co., Inc.).

The construction services of this project will be performed by an outside construction contractor operating under a fixed-price, lump-sum contract to be awarded on the basis of competitive bids. This contract will be administered by DOE, Corps of Engineers (COE) or the Operating Contractor.

Construction Management Services will be performed by the COE, DOE, Operating Contractor or by a construction management firm under contract to DOE or the Operating Contractor.

Final connections for new fire alarms and specific communication equipment will be accomplished by the Operating Contractor.

Furniture and non-engineered equipment will be procured separate from the building construction activities.

1997	7,200	0	7,200	5,800
1998	2,100	0	2,100	5,000

8. Project Description, Justification and Scope

The purpose of this project is to begin to bring the Y-12 Plant into compliance with NFPA codes, as required by OSHA and by DOE orders such as 5480.7. The project is part of a program to bring the plant into compliance. The items to be corrected by this project have been identified by internal audits, technical safety appraisals, and tiger team audits. Additional items identified but not included in this project will be prioritized, estimated, and (1) included in a future project or (2) added to this project in a future year if adequate funds are available.

This project will provide upgrading and modernization of fire protection systems, electrical equipment, mechanical systems, and emergency electrical generators which provide power for critical life safety systems. This project is part of a program which is intended to upgrade the Y-12 Plant's compliance with National Fire Protection Association (NFPA) codes relating to life safety. The extent of this project will address in excess of 200 buildings at the Y-12 plant.

The project will provide improvements to life safety in a number of areas, such as fire protection sprinklers, fire doors and walls, smoke detectors, fire alarms, emergency electrical generators, and mechanical systems. The fire protection sprinkler improvements will involve the addition of sprinklers to areas which are not covered or modifications to existing sprinkler systems to correct conditions which are in conflict with national codes. The project will install fire doors and install or upgrade fire walls to provide adequate fire separation of emergency egress paths. Smoke detection systems will be provided for life safety exits. The existing fire alarm systems will be upgraded or replaced to comply fully with current codes. Approximately 16 existing emergency generators and their controls, which supply power to life safety systems such as evacuation alarms, criticality alarms, and fire alarms, will be replaced with modern equipment.

1. Title and Location of Project: Life Safety Upgrades, Y-12 Plant, Oak Ridge, Tennessee (Continued)	2a. Project No.: 93-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

FY 1997 funding is for construction and construction management.

9. Detail of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 6,850
(1) Engineering, design and inspection at approximately 25 percent of construction costs, Item c	$ 4,050	
(2) Construction management costs	1,300	
(3) Project management at approximately 9 percent of construction costs (Item c)	1,500	
b. Land and Land Rights		0
c. Construction Costs		16,400
1. Improvement to land	0	
2. Building	13,650	
3. Special equipment	1,300	
4. Utilities	1,450	
5. Demolition	0	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		100
Subtotal (a through g)		$ 23,350
h. Contingencies at approximately 25 percent of above costs		5,850
i. Total line item cost (Section 11.a.1.(a))		$ 29,200
j. LESS: Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$ 29,200

10. Method of Performance

Facility Manager will provide engineering and procurement services for the new fire alarm and detection system. Engineering on the remaining subprojects will be performed under a negotiated fixed-price architect-engineer contract. To the extent feasible construction and procurement will be accomplished with a construction manager using fixed-price subcontractors.

1999	0	0	0	6,248

a/ Reflects the sequestration of funds for FY 1990 (-$1,246,000) and the FY 1990 omnibus reprogramming approved by appropriations subcommittee ($12,365,000).

b/ FY 1992 reprogramming, approved in FY 1993, provided funding $5,000,000 for subproject 92-32. $68,967,000 was withdrawn from FCAP for the FY 1994 budget reduction and reprogrammed to Reconfiguration. This resulted in a net adjustment of $63,967,000.

c/ The FY 1994 appropriation request has been reduced from $27,100,000 to $21,100,000 reflecting the expected reapplication of prior year funds ($6,000,000) from GPD-121. $23,903,000 of prior year appropriation credit transferred to EM in FY 1994 with the four Rocky Flats subprojects. Also cancellation of 90-17 and 91-23 for FY 1995 Amendment of $24,118,000, reduction of 89-12 of $244,000 and 91-27 of $653,000, and addition to 91-30 of $1,300,000.

d/ Cancellation of subprojects 91-23, $1,100,000 and 92-32, $4,900,000 provided funding for the FY 1996 Amendment for project 92-D-126, Tritium Loading Modifications, SR.

e/ Cancellation of subproject 90-17, $2,699,100; downscoped subproject 94-37, $1,000,000; and subproject 93-35 delayed and under review, $2,370,000; provided funding for FY 1996 offset.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope

The TEC for this project decreased from $424,253,000 to $405,174,000 and TPC decreased from $472,653,000 to $452,074,000 which is a compilation of subtracting the TEC and TPC of completed, canceled, scope changes, reprogramming actions.

The downscoping, cancellation and the disposition of funds withdrawn from several subprojects are detailed in the narrative of each subproject within this data sheet. In accordance with the FCAP plan/charter part of the uncommitted funds from completed and canceled projects have been reconciled and applied to other ongoing FCAP subprojects to reduce out-year mortgages. These actions have been accomplished utilizing the baseline change control process.

The Facilities Capability Assurance Program (FCAP) is a continuing initiative of the Nuclear Weapons Stockpile Support Complex (NWSSC) intended to actively address and manage the continuing deterioration of the Complex's aging infrastructure. The Complex has in excess of 14.3 million square feet in buildings, of which 8.97 million square feet were built in the 1940s and 1950s (56.1 percent). The primary utility systems were designed and built during these same time frames. The estimated value of these facilities (buildings and utilities) in FY 1988 dollars exceeds $8.2 billion (based on parametric evaluation escalated to FY 1988 dollars which is significantly less than actual replacement costs). An overall "investment strategy" has been developed through this line item to assure that current and future requirements and capabilities of the Department of Energy to meet national security missions does not erode as the Complexes' infrastructure continues to age and deteriorate from use. FCAP utilities an objective process to identify each project for inclusion into the line item and prioritized each project to optimize the allocation of limited capital resources. Each project is further reviewed, approved, and prioritized by the Capital Assets Management Program (CAMP).

The infrastructure deterioration problem was first addressed in the Restoration Program for production equipment, facilities, and utilities. FCAP has been developed as a follow-on program after Restoration by addressing long term solutions for: (a) correcting aging and failed utility systems; (b) correcting energy inefficiencies; (c) reduce high maintenance facilities costs; (d) improving and correcting safety and health conditions in work places; and (e) adjustment of facilities to meet current and future mission needs within the DOE complex.

FCAP was designed to maintain, repair, or replace aging and deteriorated facilities within the DOE Weapons Complex to meet current and future mission requirements with an ongoing program and maintain programmatic continuity. FCAP uses several lessons learned from Restoration as its basis, such as identifying problems through appraisals, then managing resources and priorities based on a projectable level of funding, and using those funds for a defined list of projects. These features have been adapted to the larger, more complex arena of facilities renovation, modernization, and replacement.

Key elements of FCAP as a program are as follows:

- Periodic appraisals are required for all facilities on each site. The appraisals identify deficiencies related to poor physical condition or to the facility's functional inadequacy to meet current program requirements. Deficiencies found are segregated into categories depending on the size of the problem, the most appropriate funding source, and their relative priorities. Subprojects are then scoped for budget consideration.

- Subprojects proposed for FCAP must meet certain guidelines before being included in the FCAP line item. They are included only if (a) they meet the FCAP poor-condition/functionally-inadequate criteria; (b) the Weapons Complex has a projected long term need for that facility in order to meet mission requirements; and (c) the justification is primarily based on current known mission requirements (as opposed to new initiatives or capabilities that should stand on their own).

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

- Each subproject included in FCAP's line item will be managed separately within the bounds specified in the construction project data sheet. As such, the construction project data sheet will constitute FCAP's "control list" of subprojects and FCAP's funding request will include funds necessary for both prior year mortgages and budget year new start requirements.

FCAP's purpose is to maintain the infrastructure within the weapons complex and meet current and projected mission needs in support of DOE objectives outlined by the President. FCAP does this by replacing obsolete and inadequate facilities as required to maintain programmatic continuity. All subprojects are justified and prioritized based on these long term programmatic impacts. Many secondary benefits are also gained from these replacements; especially, ES&H, Safeguards and Security, and DOE Order Compliance.

Attaining proper funding levels (originally targeted for $150 million per year) is essential to FCAP's success. When FCAP is adequately funded, replacements will be done in programmatic priority order, with additional benefits going to the ES&H areas. If FCAP is not adequately funded, work-arounds will have to be found for the facilities impacted, postponing both the programmatic and the ES&H gains until the ES&H concerns become the prime driver and the project becomes an urgently needed ES&H line item. This defeats the purpose of FCAP and doe snot enhance the long range goals of DOE's overall program objectives.

The following is a brief description and justification for each of the subprojects proposed for FY 1996 FCAP funding. Each subproject has gone through a validation and mission justification process and is included here because it is needed in order to maintain the Complex's capability to meet its current mission. FY 1997 funding requirements are noted in each subprojects funding profile.

FY 1988 Projects

Subproject 88-01: Weapons Special Purpose Bay Replacement Complex, Pantex Plant, Amarillo, Texas

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$30,000	$30,000	$0	$0	$0	$0	Subproject Completed

Subproject 88-02: Weapons Production Primary Standards Lab, Sandia National Laboratory, Albuquerque, New Mexico

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$17,700	$17,700	$0	$0	$0	$0	Subproject Completed

Contractor claims are currently being resolved. A Baseline Change Control will be processed and the schedule will be adjusted accordingly.

8. Project Description, Justification and Scope (Continued)

Subproject 88-03: Electrical Distribution System Replacement and Upgrade, Rocky Flats Plant, Golden Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Transferred to EM

Subproject 88-04: Replace Wooden Buildings, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$10,750	$10,750	$0	$0	$0	$0	Subproject Completed

Final closeout procedures have been initiated.

Subproject 88-05: Renovate Power Supply Distribution System, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$7,458	$7,458	$0	$0	$0	$0	Subproject Completed

Subproject 88-06: Restore Condensed Water System, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$1,722	$1,722	$0	$0	$0	$0	Subproject Completed

Subproject 88-07: Roof Replacements, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$5,840	$5,840	$0	$0	$0	$0	Subproject Completed

Subproject 88-08: Replace HVAC and Process Cooling System, Mound Plant, Miamisburg, Ohio

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$7,083	$7,083	$0	$0	$0	$0	Subproject Completed

Subproject 88-09: HVAC Replacements, Pinellas Plant, Clearwater, Florida

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,930	$2,932	$-2	$0	$0	$0	Subproject Completed

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Subproject 88-10: Replace Air Handling Unit and HVAC, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$3,080	$3,080	$0	$0	$0	$0	Subproject Completed

FY 1989 Projects

Subproject 89-11: Lithium Process Replacement, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$54,533	$54,533	$0	$0	$0	$0	1st Qtr FY 1989 - 3rd Qtr FY 1996

Subproject 89-12: Nuclear Facilities Modernization, Mound Plant, Miamisburg, Ohio

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$7,056	$7,056	$0	$0	$0	$0	1st Qtr FY 1989 - 3rd Qtr FY 1996

This subproject was directed to be canceled and closed-out by ASDP in February, 1992, in response to the Nuclear Weapons Reduction Initiative. Two sub-tasks within this project, "Hot Side Chilled Water System" and "Replacement of two PCB Transformers" were approved for completion because these two sub-tasks are required regardless of the completion of the major subproject.

Subproject 89-13: Replace Microminiature Electronics, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$29,100	$29,100	$0	$0	$0	$0	1st Qtr FY 1989 - 1st Qtr FY 1997

This subproject will replace the existing microminiature electronics assembly facility at the Kansas City Plant (KCP) by constructing new facilities within the main manufacturing building and relocating current operations. The new facility will total approximately 31,000 square feet of usable production area on the factory floor plus approximately 23,500 square feet of equipment platforms and utility tunnels (basement). The new facility will provide capability and capacity for the development and production of thin-film and thick-film networks for hybrid microcircuits (HMC); this HMC production facility is the only one of its type within the nuclear weapons production complex. The existing cleanroom facility has exceeded its normal life expectancy, is losing its capability to maintain cleanliness at the Class 10,000 control level, and is several generations behind modern cleanroom technology making it technologically obsolete. Existing manufacturing processes used in the production of thin-film and thick-film electronics requires Class 100 cleanliness, 5 to 50 Hertz vibration control, and more stringent control of temperature and humidity. Currently, when the dust count exceeds the maximum allowed, production operations are suspended until control is regained by repairing equipment and manual wipe-down of cleanroom surfaces. Production interruption times range from a few hours to several days, during which production material and assemblies must be stored in closed containers and nitrogen pressurized storage cabinets.

8. Project Description, Justification and Scope (Continued)

Subproject 89-14: Replace Deionized Water System, Pinellas Plant, Clearwater, Florida

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$8,271	$8,271	$0	$0	$0	$0	Subproject Completed

Subproject 89-15: Change House Replacement, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$13,500	$13,500	$0	$0	$0	$0	Subproject Completed

The purpose of this subproject is to replace or refurbish functionally and physically inadequate change house facilities. Implementation of this project will reduce operating costs by demolishing high maintenance, obsolete facilities; by providing cost effective contamination control design; and by consolidation of smaller change houses.

Approximately 45,000 square feet of new facilities will be constructed of structural steel framing and reinforced concrete with the exterior skin consisting of prefinished metal panels and masonry. Mechanical heating and ventilating systems will also be provided. In addition, 11,000 square feet of existing change house space will be renovated to meet current regulations. This will allow the demolition of 66,000 square feet of wooden buildings (9723-1, 9723-18, 9723-19, and 9723-21) and the decommissioning of 17,000 square feet of change house space.

The existing wooden change houses to be replaced by this project were built in 1943/1944. While routine maintenance has kept them marginally acceptable, it is uneconomical to modernize or otherwise restore these buildings. Building structural and framing systems have deteriorated due to termite infestation. Mechanical and electrical systems are inadequate and out of compliance with various codes and standards.

FY 1990 Projects

Subproject 90-16: Building Electrical Rehabilitation, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Transferred to EM

Subproject 90-17: Production Plating Shop Replacement, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$9,660	$22,400	$-6,000	$-8,740	$0	$0	Subproject Canceled

Final closeout and paperwork has been initiated.

290

8. Project Description, Justification and Scope (Continued)

This subproject has been canceled as a result of new mission requirements. The changes to the TEC and funding profile were accomplished through the Baseline Change Control process. FY 1995 reduction of $4,000 was used to reduce outyear mortgage on project 92-31.

Subproject 90-18: In-Process Plutonium Staging Vault, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,070	$2,070	$0	$0	$0	$0	Subproject Canceled

This project has been canceled in response to the Nuclear Weapons Reduction Initiative.

Subproject 90-19: Support Office Building, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$3	$3	$0	$0	$0	$0	Subproject Canceled

This project has been canceled in response to the Nuclear Weapons Reduction Initiative.

Subproject 90-20: West Area Expansion, Rock Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Subproject Canceled

This project has been canceled in response to the Nuclear Weapons Reduction Initiative.

Subproject 90-21: Contractor Support Facility, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Subproject Canceled

This project has been canceled in response to the Nuclear Weapons Reduction Initiative.

FY 1991 Projects

Subproject 91-22: Replace Electrical System Components, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$12,700	$12,700	$0	$0	$0	$0	1st Qtr FY 1991 - 3rd Qtr FY 1996

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations

2a. Project No. 88-D-122
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

This subproject will replace significant portions of the 40+ year old electrical power distribution system in the Kansas City Plant. Major portions of the existing electrical power distribution system were installed in 1942 and have reached the end of their design lives. The current electrical system's reliability is deteriorating due to its age and replacement is essential to continued production at this plant.

This distribution system provides electrical service to over 2,000,000 square feet of the plant's 3,200,000 square feet of floor space. Also, the obsolete design of the existing electrical substations includes integral transformers and switch units; system reliability is greatly reduced by this design because any switch or transformer malfunction could require the entire unit be removed and replaced, an operation which requires approximately six months. This would require costly and cumbersome work-arounds to maintain production in the affected areas.

The major portion of this subproject will replace components in substations ranging in size from 200 to 2,500 KVA. Specific components to be replaced include approximately 44 integral transformer and primary switch units and approximately 18 switchgear units. The power feeder cable, which will also be replaced, includes approximately 17,000 ft. of 15 KV cable and approximately 12,000 ft. of associated cable tray. The existing oil-filled transformers will be replaced with dry type transformers. All switchgear units will have electronic controls with fault detection to allow precise clearing of electrical faults which are the major cause of electrical fires. Existing non-fused cable selector air switches and oil switches will be replaced with new fusible, single cable air switches with current limiting fuses to provide short circuit protection. The existing wooden cable tray will be replaced with a metal tray, eliminating a potential fire hazard.

Other replacements include approximately 600 feet of bus duct, approximately 48 lighting and power panels, circuit breakers in approximately 120 panel boards, two outside overhead power lines, and two 28 year old emergency generators.

Subproject 91-23: High Explosive Formulation Facility, Pantex Plant, Amarillo, Texas

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$1,963	$3,920	$-1,957	$0	$0	$0	Subproject Canceled

This subproject has been canceled as a result of new mission requirements. Closeout procedures are underway to determine final funds expended. The $1,100,000 was withdrawn per the FY 1996 amendment and $857,000 transferred to subproject 94-38.

Subproject 91-24: Renovate Water Supply System, Pantex Plant, Amarillo, Texas

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$9,500	$9,500	$0	$0	$0	$0	1st Qtr FY 1991 - 1st Qtr FY 1996

This subproject will replace the primary water storage reservoir facility, substantially renovate the Zone 11 and 12 fire protection water system, and replace four inadequate wells. The present system does not provide adequate fire protection water supplies to 68 buildings in Pantex's Production and Development Zones (Zones 11 and 12, respectively) due to age of the key components and present system configuration. These areas deal extensively with high explosives and the fire protection supplies must be able to provide deluge water to any fire, quick, to protect critical production buildings.

292

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Subproject 91-25: Central Steam Plant Renovation, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Transferred to EM

Subproject 91-26: Replace Graphite Dust Collection System, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$361	$361	$0	$0	$0	$0	Subproject Canceled

This project has been canceled in response to the Nuclear Weapons Reduction Initiative.

Subproject 91-27: Refurbishment Power Supply/Distribution System, Phase II, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$54,597	$33,947	$5,400	$1,100	$2,950	$11,200	1st Qtr FY 1991 - 4th Qtr FY 1999

This project will refurbish the Y-12 electrical power supply/distribution system by: (1) restoring Elza I switchyard (the primary 161-Kv switchyard for Y-12 Plant); (2) refurbish electrical power control system (161-and 13.8-Kv); and (3) refurbish the secondary distribution system. These refurbishments must be done to provide the necessary reliability and maintainability required for weapons production at the Y-12 Plant and (4) consolidate switchgear from Building 9201.4.

FY 1997 funds ($2,950) will be used for Title I and Title II design for the electrical switch gear consolidation.

Subproject 91-28: Site Electrical Replacements and Substation, Mound Plant, Miamisburg, Ohio

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$770	$770	$0	$0	$0	$0	Subproject Canceled

This project has been canceled in response to the Nuclear Weapons Reduction Initiative.

Subproject 91-29: Replace Temperature and Humidity Conditioning Systems, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$27,927	$32,477	$-4,550	$0	$0	$0	1st Qtr FY 1991 - 4th Qtr FY 1996

A Baseline Change Control was approved to reduce the TEC by $4,550,000. The $4,550,000 was transferred to project 95-40 to fully fund the project. The $4,550,000 was made available by value engineering studies and favorable bids.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

This subproject will replace or restore the temperature and humidity control utility systems at the Kansas City Plant (KCP). Manufacturing operations at KCP rely heavily on stringent temperature and humidity controls to maintain close tolerances in mechanical and electronic weapons components. Approximately 90 percent of KCP's 3.2 million sq. ft. of floor space is temperature controlled at 74 degrees Fahrenheit +/- 7 degrees, and approximately 20 percent of KCP's floor space is humidity controlled to 50 percent relative humidity maximum. The systems being replaced and upgraded have exceeded their useful life expectancies and are no longer functionally adequate to maintain these internal environment requirements during normal external winter (i.e., 2 degrees F) and summer conditions (i.e., 99+ degrees F with 70+ percent RH).

Subproject 91-30: Central Fire Station Emergency Operations Center, Pantex Plant, Amarillo, Texas

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$8,000	$8,000	$0	$0	$0	$0	2nd Qtr FY 1994 - 2nd Qtr FY 1996

This subproject will design and construct a new Central Fire Station to replace inadequate, overcrowded facilities for the fire department's present operations. It will also replace current Emergency Operations Center (EOC) facilities with adequate facilities that comply with current DOE requirements. Since many of the support facilities for the EOC (e.g., kitchen, sleeping area, exercise area, showers, and emergency communication and power) are basic requirements for the fire department, it is cost effective to combine these two functions into a common facility.

The building will be a single story structure of approximately 25,300 gross square feet. The EOC and joint use areas, approximately 12,400 square feet, will be hardened for security and tornado protection. The fire station area, approximately 12,900 square feet, will be conventional construction. This building will be located inside the security area of the north end of Zone 12 at Pantex Plant, Amarillo, Texas. Parking and staging areas for emergency vehicles and road access will be provided.

FY 1992 Projects

Subproject 92-31: Replace/Refurbish Deteriorated Elevators, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$10,920	$2,220	$4,000	$2,200	$2,500	$0	1st Qtr FY 1992 - 2nd Qtr FY 1998

A Baseline Change Control was approved to transfer $4,000,000 of FY 1995 funds from canceled subproject 90-17 to this subproject. The FY 1997 requirement was reduced by the same amount to leave the TEC the same. This internal FCAP transfer of funds is within the FCAP charter and does not effect the overall FCAP TEC.

This subproject will replace or refurbish elevators in the production/production support buildings. These elevators are a primary and necessary means for transporting weapons-related materials and assemblies from one manufacturing area to another within the production/production support buildings. These 1940 vintage elevators are presently unreliable and interrupt the flow of manufactured components when inoperative. Significant maintenance and the fabrication of unavailable, obsolete parts are required to keep the elevators operational.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations

2a. Project No. 88-D-122
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The elevators in the Y-12 Plant have been in service since the 1940's and 1950's and are deteriorating with age and use. This project will replace elevators which are physically deteriorated and functionally inadequate to move weapons components within the production buildings. These elevators require extensive repair and preventative maintenance and pose a potential safety threat to personnel. Many of the older elevators do not meet current elevator standards, and the capacity of some of the elevators have been downgraded for safety reasons. The reduction in load capacity requires "work arounds" to maintain production which, in turn, delays production and introduces additional safety problems.

This subproject is a phase repair/replacement effort. As guidance is received at Oak Ridge from DOE/HQ for downsizing activities, Oak Ridge evaluates the Y-12 site requirements and determines which facilities will remain active and that in turn determines which elevators require refurbishment. This course of action reduces the possibility of refurbishing an elevator in a facility determined to be decommissioned.

The alternative to upgrading and/or replacing the existing elevators as proposed is to continue maintaining and repairing the elevators until they have to be shut down. This is unacceptable due to the increased safety and security risk incurred to move weapon parts and production personnel between floors.

The FY 1997 funds ($2,500,000) will be used to continue the repairing/replacement of elevators determined to be required to meet current mission requirements.

Subproject 92-32: Tritium Shipping Container Facility, Savannah River Site, Aiken, South Carolina

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$100	$5,000	$-4,900	$0	$0	$0	Subproject Canceled

This subproject has been canceled because of mission changes. The appropriated amount of $4,900,000 was removed from this project and placed in the FY 1996 amendment, for Project 96-D-126, Tritium Loading Line Modifications, SR.

FY 1993 Projects

Subproject 93-33: Plutonium Facilities HVAC Restoration, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Transferred to EM

Subproject 93-34: Replace Deteriorated Facilities, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$0	$0	$0	$0	$0	$0	Subproject Canceled

This subproject has been canceled in response to the Nuclear Weapons Reduction Initiative.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Subproject 93-35: Upgrade Materials Engineering Laboratory, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$13,200	$5,200	$160	$0	$2,470	$5,370	1st Qtr FY 1996 - 4th Qtr FY 1997

This subproject will upgrade the Materials Engineering Laboratory capabilities at the Kansas City Plant (KCP). Based on a Value Engineering Study, current mission guidance, and downsizing activities at KCP the location of this project is recommended to be changed from renovating and adding a 2-story prefabricated building at the North Wing Laboratory Building 86 to renovating space within the Manufacturing Support Building (MSB), Building 13. The mission and requirements for this project have been revalidated and rejustified and are required for current mission activities. A Baseline Change Control was approved which changed the subprojects location and schedule.

The new Materials Engineering Laboratory will be constructed in approximately 24,500 square feet of existing space in the Manufacturing Support Building (MSB), Building 13. This location will co-locate the laboratory with the existing Analytical Science Laboratory in the MSB, offering efficiencies and synergy through common staffing and equipment. Upon completion of the new laboratory in the MSB, the existing laboratory in Building 86 will be vacated, returning Building 86 to an open high bay space available for other uses. Contaminated exhaust ductwork and fans, asbestos, containing materials and excess equipment, furnishings, and associated utilities in the old laboratory area will be removed following the laboratory relocation to the new facility location.

The new laboratory facility will be designed to meet the requirements of the National Fire Protection Association (NFPA) 45 - Fire Protection for Laboratories Using Chemicals and will combine the two laboratory office areas and rearrange the existing materials engineering laboratory into separate areas by type and function. A new chemical storage room with perimeter exhaust and curbing is included. Interior structures, and systems/components will be installed in accordance with the latest DOE orders, Uniform Building Code, and the Sheet Metal and Air Conditioning Contractors National Association (SMANCNA) recommendations for general use facilities.

The Materials Engineering Laboratory is needed to evaluate material properties and to develop material fabrication processes. These activities are necessary to solve production process problems, certify production materials, evaluate the hazardous properties of materials for possible personnel safety or environmental pollution effects, and develop new materials and processes for weapon production. The existing laboratories have been in use since 1964 with few improvements and many added processes. The laboratories suffer from severe overcrowding as the result of continued expansion and addition of evaluation processes without additional space. Many process and material evaluations cannot be done simultaneously because the close proximity of areas and the incompatibility of process activities and/or materials. This upgrading must be accomplished to meet current safety (OSHA) regulations on a fixed basis instead of the current administrative control arrangement.

Subproject on hold pending Programmatic Environmental Impact Statement decision and the FY 1996 funding used for the FY 1996 budget offset.

Subproject 93-36: Investment Casting Furnace Facility, Sandia National Laboratories, Albuquerque, New Mexico

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$3,660	$3,660	$0	$0	$0	$0	4th Qtr FY 1994 - 4th Qtr FY 1995

The facility will add approximately 6,000 sq.ft.of high bay space to the Liquid Metal Processing Laboratory of Building 6630 within the AREA III perimeter security. The high bay will provide space for a new casting furnace and its ancillary equipment, a closed-loop cooling system and a motor control center, relocated existing equipment, and a bridge crane. Environmental and electrical control systems will be provided to meet laboratory requirements.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

This subproject will provide safe, efficient investment casting processing and significantly reduce the congestion of the remainder of the melting and solidification laboratory. Over the past several years, the need for supporting the DOE Weapons Complex by the development of investment casting and the preparation of prototype investment castings has increased markedly, due, in part, to the reduced cost of cast component housings (50% to 90% reduction). Recently, all of the development fireset housings for the W89 were cast in this laboratory. Downsizing of the weapons complex increases the need for a cost-effective, rapid-prototyping method of producing investment castings for current and future weapons systems. Sandia has been identified as the probable source of investment castings to the weapons complex. This new facility will provide vital technology toward production of these castings on a timely basis.

FY 1994 Projects

Subproject 94-37: Chilled Water System Replacement, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$9,600	$3,200	$5,500	$-2,000	$0	$2,900	2nd Qtr FY 1995 - 3rd Qtr FY 1996

This subproject will provide a new Central Chilled Water Plant in an existing building centrally located on the north wall of the Main Manufacturing Building. Two chillers currently located in the East Boilerhouse and two chillers currently located in the West Boilerhouse will be removed and replaced with five new 1,200-ton chillers and associated pumps, piping, and controls installed in the new Chilled Water Plant. The new Central Chilled Water plant will include space for one additional 1,200-ton chiller. Cooling towers, condenser water pumps and electrical substations will be installed outside, adjacent to the building. A direct digital control system will be installed and connected to the East and West Boilerhouse for monitoring and coordination with the plant's chilled water system.Additionally, this project will replace six 20-ton, two 10-ton, and one 15-ton direct expansion (DX) air conditioning units with four new air handling units and one 15-ton DX unit with a new DX unit. The new air handling units will occupy the same locations as the old units, where possible, or will be installed on roof-mounted platforms requiring new chilled water and steam utility piping and duct modifications. Existing control systems will be replaced with direct digital control systems.

Chilled water is the only source of cooling for the plant's air conditioning system. Chilled water is used extensively to maintain temperature and humidity conditions in production areas having precise control requirements and also in all other factory and office space. Chilled water is currently generated in the East and West Boilerhouses and distributed throughout the plant. Both boilerhouses are fully occupied by chillers and other equipment supplying utility services such as steam and compressed air to the plant with no available space for additional chillers, or any other boilerhouse equipment additions.

Subproject downscoped.

Subproject 94-38 Roads and Parking Area Upgrades, Pantex Plant, Amarillo, Texas

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$13,300	$1,400	$3,859	$8,041	$0	$0	3rd Qtr FY 1995 - 1st Qtr. FY 1998

This subproject is to repair, replace, and upgrade approximately 25 miles of roads, approximately 36,500 square yards of parking areas and associated equipment at the Pantex Plant. These roads and equipment have exceeded their expected serviceable life by up to 25 years, and are significantly deteriorated.

8. Project Description, Justification and Scope (Continued)

Transportation requirements at Pantex Plant have altered significantly in the 45 years since the Plant was constructed. Many of the existing roads were constructed with 18-foot pavement width or less to carry two-way traffic, which is much too narrow by today's standards. Changing production, security and fire protection requirements, increased volume of traffic, and increased size and weight of vehicles since the plant was constructed have all contributed to the inadequacy of existing roads at the Pantex Plant. Now that many of the roads have surpassed their serviceable lives and must be reconstructed, the road and parking areas should be located so as to optimize plant operations. This project will provide a long range traffic plan as a necessary part of the design. Signage and pavement marking on Pantex Plant roads and parking areas are not consistent. Part of the design process for this project will be to adapt the recommendations and requirements of the Department of Transportation "Manual on Uniform Traffic Control Devices" to the requirements of the Plant.

Normal bituminous concrete pavings are designed for a finite structural design period, normally 20 years for highway class pavings or something less for light duty pavings such as some access roads and parking lots. The structural design period is the estimated number of years that a paving is expected to carry the design traffic volume before reaching the minimum serviceability level. Surface maintenance and/or overlays may be required for a pavement to achieve this serviceable life, but any benefit from pavement overlays or surface treatments applied after a pavement has reached its serviceable life will be of very short duration (estimated 3 to 9 months) and futile for long-term use. Many of the roads proposed for reconstruction in this project were initially constructed either during the construction of the plant in the early 1940s or during the conversion of the plant to an AEC plant in the mid-1950s. While the service life of these roads is not specifically known, it would not have been more than 20 years, which has been exceeded by 100% on many pavements.

Maintaining a good surface course on pavements at Pantex is especially critical due to poor drainage caused by the extremely flat terrain at the plant. Water from heavy snow storms and rains must be kept away from the pavement base and sub-base courses if the pavement is not to fail prematurely.

FY 1995 Projects

Subproject 95-39: Replacement of Compressed Air System, Pantex Plant, Amarillo, Texas

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$3,900	$0	$410	$420	$3,070	$0	1st Qtr FY 1997 - 2nd Qtr FY 1998

The Pantex Plant was built in the early 1940s and modified in 1951 to produce nuclear weapons. The existing compressed air piping system in both Zone 11 and 12 is undersized due to changes in building function and plant expansion over the past several years. Satellite (back-up) compressor stations are presently being used to provide good quality (dry, oil free) compressed air to buildings. There are currently 15 satellite compressors in Zone 11 and 88 in Zone 12. An estimated 25% reduction in maintenance costs will be realized when this project is completed.

The mission and programmatic objectives of the entire plant rely upon dependable and consistent supply of high quality compressed air. This project will provide that necessary utility. Compressed air is used extensively at the plant to operate hoists and tools used in the assembly/disassembly of weapons. Specially designed machine used to machine high explosive have special air bearings that require clean, dry air. Contamination of these bearings can cause failure with catastrophic results. Compressed air assists in the opening of heavy blast doors in the bays and cells. Compressed air is used in the control and actuation of vital fire protection systems in the bays and cells and heating, ventilation, and air conditioning controls throughout the plant.

FY 1997 funds ($3,070,000) will be used to complete construction activities.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Subproject 95-40: Replace Firemains, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$4,900	$0	$4,900	$0	$0	$0	3rd Qtr FY 1996 - 4th Qtr FY 1998

$4,550 moved from project 91-29 to project 95-40 to fully fund project.

Sections of the existing fire protection sprinkler supply mains, some exterior underground and some interior overhead, will be replaced with new cement lined pipe to prevent corrosion, tuberlucation which has developed in the existing unlined pipe. The fire main to be replaced inside the main manufacturing building includes approximately 2,300 feet of 10-inch diameter, schedule 40 steel pipe. The underground cross main include includes approximately 400 feet of 8-inch diameter ductile iron pipe. All of this firemain replacement will be with cement lined pipe and will include replacement of appropriate valves and fittings. The underground piping for the four (4) sprinkler lead-ins involves approximately 300 feet of 10-inch diameter pipe and 400 feet of 8-inch diameter pipe.

FY 1996 Projects

Subproject 96-41: Replace Cooling Tower, East, Kansas City Plant, Kansas City, Missouri

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$5,020	$0	$0	$1,570	$3,450	$0	3rd Qtr FY 1997 - 3rd Qtr FY 1998

This subproject will combine and upgrade two of the separate and deteriorated condenser water systems at the East Boilerhouse. This will be accomplished by replacing the existing 5-cell center and 2-cell west cooling towers, six condenser water pumps, five variable speed pump drives, related electrical equipment and circuitry, two basin dewatering pumps, and the direct digital control (DDC) system for the condenser water; and by interconnecting the west and center cooling tower cold water basins and the condenser water piping. This will allow operation of combinations of chiller(s), tower(s), and pump(s). The new DDC system will control the tower fans, riser valves, pumps and monitors the performance of the condenser water systems.

The existing systems at the East Boilerhouse consist of:

1. West 2-cell cooling tower (CT-W) with three condenser water pumps, two with variable speed drives, and one constant speed pump, which is a backup.

2. Center 5-cell cooling tower (CT-C) with three condenser water pumps, all with variable speed drives, one of which is a backup.

3. East 2-cell cooling tower (CT-E) with two condenser water pumps, with no backup, and no variable speed drives. This system will not be modified.

The west and center towers are partially connected in the condenser water piping arrangement, but the tower basins are not connected. The east system is totally independent of the west and center. The three systems were installed in four stages at different times (1974 to 1984) to serve specific chillers/loads.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

This project will interconnect the piping, basins, and controls of the west and center towers to allow any combinations of two towers (six cells) and five pumps to serve any combination of the projected load with ten chillers in the East Boilerhouse to produce 6750 tons.

The NWSSC within the DOE is comprised of seven weapons production plants at seven locations across the country. The NWSSC, through the Department, is responsible for the production and lifetime surveillance of safe and reliable nuclear weapons in support of the United States national security. The NWSSC's mission requires that it maintain the ability to (1) produce nuclear warheads, projectiles, and bombs as approved by the President as required to maintain and enhance our nation's nuclear deterrent; (2) maintain surveillance and certification of the technical quality of nuclear weapons in the existing stockpile; (3) supply and provision of the associated limited life components necessary to keep the stockpile in a War Readiness condition; and (4) disassemble and retire nuclear weapons and their components when they are removed from the stockpile. In this context, the NWSSC's role is an ongoing one until such time as all nuclear weapons are no longer needed and have been successfully retired from the stockpile.

The issue of maintaining the NWSSC's long-term ability to perform its mission was first addressed through the Utilities and Equipment Restoration, Replacement and Upgrade Program in the late seventies. This was a multi-year program encompassing the seven NWSSC sites as well as the three weapons laboratories and the Nevada Test site. Items of equipment and utility components were identified for possible replacement or upgrading when appraisals found them in poor physical condition and/or inadequate in terms of technology. Replacements and upgrade were accomplished in priority order using "control lists" at each site to assure allocation of funds to the highest need at that site. Thanks to Restoration making inroads against the deterioration identified in the appraisals and to somewhat increased levels of Capital Equipment funding received, the NWSSC has been able to meet workload delivery schedules and objectives during the early eighties. If those sources of funds had not been available, the deteriorated conditions would have severely jeopardized the meeting of those schedules. However, large problems continue to arise in its aging facilities (buildings, utilities, and other real property improvements). Reasons behind this are several:

- The NWSSC's buildings and the primary utilities supporting them are reaching critical points in their useful life-spans. Most of the current structures were designed for a 40 year life and were of commensurate construction. Many of the structures are now reaching 40 to 50 years of age, a point at which items such as interior utilities become critical problem areas and structural problems begin to surface. Roof life spans range from 15 to 30 years, depending on construction and roofing materials used, but cannot be expected to last beyond this age with reasonable integrity. HVAC systems, with a typical life of 15-20 years, need to be replaced or upgraded one or more times during a building's life-span. The primary utilities need sizable renovations typically after only 30 to 40 years, less in some areas with extreme weather or service conditions. On any utility equipment, spares are discontinued after approximately 25 years, making maintaining systems of NWSSC age increasingly difficult. These kinds of problems are routine for facilities the age of those in the NWSSC and require routine large-scale renovations, repairs and replacements to maintain the facility infrastructure. Such a maintenance program for an infrastructure of the NWSSC's size and complexity cannot be accomplished within existing GPP or operating funding limitations, yet must be ongoing to sustain the capability to perform the required functions.

- The NWSSC is going through a technological transition of immense proportions in order to keep pace with tight tolerance and new process demands imposed by the latest generation of weapon systems. Weapons systems now in Phase 4 are significantly more sophisticated and complex than their predecessors and are being built to much tighter tolerances than in the earlier decades. This, in turn, requires more controlled environments and closer tolerance support systems to sustain the new state-of-the-art production equipment and processes that are required. Environmental problems include tighter temperature and humidity requirements, dust control specifications, electrical power cleanliness and reliability, and higher floor and foundation resistance to vibration. Many of the current structures, utilities and other facilities cannot reliably support these high-tech demands in a long-term fashion as they continue to age and undergo continued upgrades.

300

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

In the past, large facility "fixes," such as those described above, have been budgeted for on a case-by-case, stand-alone basis, often being deferred several years until the problem compounds to the point of near-urgency priority before being funded. When there were few such problems to contend with, this was an acceptable practice. To continue it causes concern about maintaining the NWSSC's ability to perform its mission over the long term.

Since FCAP began in FY 1988, many new ES&H issues have surfaced revolving around the age and condition of the NWSSC and DOE's other related facilities. The subject headings include "Waste Treatment," "Radiation Contamination and Control," and "Technical Safety Appraisals" to name a few. Each has dealt in some way with problems caused by aging facilities and the need for a systematic replacement program, such as FCAP.

Most subprojects now in FCAP provide strong, though ancillary gains in environmental, safety or health areas (e.g., Change House Replacement, Y-12; In-Process Plutonium Vault, RF; and High Explosives Formulation Facility, Pantex). Increased, strong levels of support for FCAP as a program are necessary in order to maintain this orderly prioritized system. If support is not increased to the required levels, probabilities are very high that any subprojects slipped will become urgently needed ES&H stand-alones and will amplify concerns about the NWSSC's long term future.

A continuing, systematic replacement program supported at the proper funding level is essential.

FY 1997 Projects

Subproject 97-42: Hydraulic Press, Y-12 Plant, Oak Ridge, Tennessee

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$14,000	$0	$0	$0	$7,500	$6,500	1st Qtr FY 1998 - 4th Qtr FY 1999

This subproject will procure and install a new 3,500 ton press to forge billets and form machine blanks and will replace the 1,000, 1,500, and 7,500 ton presses in Building 9204-4. The press will be located in F-Area of Building 9998. Building 9998 will need extensive modifications to accommodate the new press. The equipment exhaust will be connected to the existing High Efficiency Particulate Air (HEPA) filter system. The floor will be modified to incorporate a pit and the building height will be increased. The building steel will be reinforced to facilitate press loading and utility services will be extended from existing headers in the area.

The FY 1997 obligations will provide for Titles I and II engineering, initiating construction and the procurement of the new press.

This subproject is required to support Defense Programs consolidation by completion of the equipment requirements for the depleted Uranium and Uranium alloy capabilities. This project will ensure the requirement to maintain nuclear competence. It is required to fully realize annual operating cost reductions. The project supports expected enhancements in worker health and safety by reducing potential exposure to airborne radioactive material, elimination of point of operation risks (OSHA), and elimination of administrative controls by installation of physically engineered controls to prevent worker exposure to hazardous operations and materials.

1. Title and Location of Project: Facilities Capability Assurance Program (FCAP), Various Locations	2a. Project No. 88-D-122 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs

This represents normal engineering design, procurement, construction, and inspection of utility and construction projects of this size, range, and complexity.

2. Other project costs

(a) Conceptual design report (CDR) costs are included for 41 ongoing subprojects. CDR costs are not included for subprojects being developed but not in this data sheet. CDR preparation is averaging one percent (1%) of the total estimated construction cost (TEC); follow-on studies and site characterization activities that must be accomplished during Title I & II design average an additional one percent (1%) of the TEC.

(b) ES&H documentation and reporting has become more intense; this includes environmental documentation (EA's or EIS's) and health and safety documentation (SA's, PSAR's, SAR's, et al) which usually must be completed before construction can be started. These activities average from one to five percent (1% - 5%) of the subproject TEC.

Start-up documentation and reporting requirements have increased significantly. These include operational readiness reviews, operating procedure reports, operating safety reviews, et al; these costs are as much as 25% of the subproject TEC for complex, specialized facilities and processes, both nuclear and non-nuclear, and the action must be completed before the facilities can be placed in operation.

b. Related annual costs

Estimated programmatic lives of these facilities vary by site and by subproject. The other related funding requirements for these facilities are not considered to be significantly different from those of the facilities being replaced by this program. Therefore, no costs are shown.

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas	2a. Project No.: 88-D-123 2b. Construction Funded

SIGNIFICANT CHANGES

- Subproject 01a - SNM Component Staging Facility Backfits--added to address Building 12-116 deficiencies tied to design, construction, and current DOE design/operating criteria, for a Hazard Category 2 (moderate hazard) nuclear facility. Additional funding will come from current SEP contingency resources.
- Subproject TEC increases are due to prior year funding reductions and escalation cost increases due to subproject start delays.
- Subproject TEC decreases reflect fixed priced contract awards and estimates at completion (EAC).
- Related annual costs changed to reflect total cost. Previous estimate of $2 million reflects incremental costs.

Stockpile Management

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas

2a. Project No.: 88-D-123
2b. Construction Funded

3a. Date A-E Work Initiated (Title I Design Start Scheduled): 3rd Qtr. FY 1988

3b. A-E Work (Titles I & II) Duration: 3rd Qtr. FY 1988 - 2nd Qtr. FY 1994

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $125,000
Total Project Cost (TPC) -- $130,000

4a. Date Physical Construction Starts: 3rd Qtr. FY 1990

4b. Date Construction Ends: 4th Qtr. FY 1997

6. Current Cost Estimate:
TEC -- $125,000
TPC -- $130,000

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1988	$ 5,700	$ 0	$ 5,700	$ 69
1989	7,500	0	3,500	2,586
1990	5,500	(83)a/	2,417	3,514
1991	18,244	0	23,701	8,407
1992	30,000	0	30,692	15,042
1993	0	0	372	9,700
1994	20,000	0	20,000	13,235
1995	15,000	0	14,937	34,754
1996	13,400	0	12,463	18,239
1997	9,739	0	9,740	16,454
1998	0	0	1,478	3,000

8. Project Description, Justification and Scope

This project identifies subprojects required to enhance the Pantex security posture.

Because of the high target attractiveness inherent in its mission, and the ever-increasing concern for stronger, more effective protection programs, the Pantex Plant has implemented, over the years, a steady stream of security and safeguards-related upgrades/enhancement projects. These improvements have made the Pantex protection system strong, but the issuance of revised threat guidance and evolving changes in philosophy have imposed stringent expanded requirements on acceptable levels of security and safeguards protection programs. As a result, an

a/ Reflects the Sequestration of funds for FY 1990.

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

in-depth analysis has been performed of Pantex and its current ability to counter all adversary threats enumerated in the "Generic Threats to DOE Nuclear Programs and Facilities Statement," dated January 1983, with emphasis placed on the insider threat.

The in-depth analysis includes detailed vulnerability studies and credible scenarios. As a result, the security upgrades proposed in this project are necessary to improve the ability of Pantex to defeat potential adverse actions as described in the latest DOE threat guidance.

These subprojects reflect the best security enhancement from information and emphasis known to date. The scope and priority of each subproject is subject to subsequent revision to reflect the results of further vulnerability assessments, field exercises, and inspections and management direction. This is required to assure that the results of further threat scenario analysis are considered in the actual implementation of the subprojects. The project costs reflect this.

The Production Zone (Zone 12 South), the Special Nuclear Material (SNM) Isolation Area, the Staging Area (Zone 4 West), and the general site include projects which enhance Pantex physical protection, detection alarm assessment, SNM facilities, safeguards of SNM, access control, and security training.

Each subproject includes associated site work for drainage, roads, parking, and utilities. Also included are foundations, walls, roofs, doors, windows, water, sewer, HVAC mechanical equipment, fire protection, alarms, lights, and electrical power to make it functional and satisfy general facility design requirements.

a. Subproject 01 - SNM Component Staging Facility b/

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$22,300	$22,300	$0	$0	$0	$0	1st Qtr. FY 1991 - Completed

There are six objectives that this subproject will accomplish. These objectives are:

- Enhance the plant's security and safeguards postures by constructing a 46,000 square foot facility that will provide the highest amount of physical protection for Special Nuclear Material (SNM).
- Reduce personnel radiation exposure from SNM to the lowest possible level in the most efficient manner.
- Enhance the overall fire safety for the receiving, storage, and inspection of SNM by obtaining a new noncombustible fire-resistant facility which will have operations separate from other warehousing and plant operations.
- Consolidate the staging and support operations in order to achieve a more efficient operation.
- Eliminate crowded conditions in the operational areas which create operational inefficiencies.
- Reinstitute an assembly cell for production use currently being used as an interim SNM staging area.

b/ This subproject is currently being evaluated to determine the extent of design deficiencies to be corrected before facility operation is approved. Total estimated cost for this retrofiting will be completed by the end of the 3rd Qtr. FY 1996. Increased costs will be absorbed by project contingency.

8. Project Description, Justification and Scope (Continued)

a. Subproject 01a - SNM Component Staging Facility Backfit

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,500	$0	$2,500	$0	$0	$0	4th Qtr. FY 1995 - 4th Qtr. FY 1996

The purpose of this subproject is to modify the facility to comply with applicable portions of DOE Order 6430.1A. These modifications will be necessary to comply with new safety regulations adopted since the initiation of the design of the facility.

The TEC of $2,500,000 is to fund initial analysis, design and construction costs for modifications to insure that the facility meets DOE Order 6438.1a requirements. It is presently forecasted that further funds will be required once the analysis is completed.

b. Subproject 02 - Protected Area Enhancements

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,850	$4,600	$(1,750)	$0	$0	$0	3rd Qtr. FY 1990 - 4th Qtr. FY 1996

This subproject provided for construction of guard stations and will provide for equipment procurement to upgrade security stations at the entrances to protected areas of the Pantex Plant. This subproject includes a protected area guard station upgrade, vehicle barriers and gamma detectors, x-ray, and metal detectors. Equipment procurement and installation has been combined under Electronic Enhancements - Argus, per Baseline Change Proposal 04.

The security stations involved, locations, and work performed follows:

- Building 11-40, Station 3, entrance on east side of Zone 11. Install detectors with audible and visual alarms for pedestrian and vehicular traffic.

- Building 16-3, Station 7, entrance near Vehicle Maintenance Facility, Building 16-1. Install detectors with audible and visual alarms for pedestrian and vehicular traffic.

- Building 12-54, Station 20, personnel entrance at south end of Zone 12 South provided by FY 1984 line item, Weapons Assembly Bays Changehouse and Guard Station. This subproject is complete.

- Personnel entrance in ramp near Building 12-1, Changehouse, Station 24. Install detector with visual and audible alarms for pedestrian traffic.

- Building 12-90, Station 26, personnel entrance at north end of Zone 12 South in ramp near Building 12-33, Subassembly. This subproject is complete.

- Building 12-77, Station 28, vehicle entrance at north end of Zone 12 South. Install access control equipment and vehicle barriers in the Zone 12 South Vehicle Entrance Guard Station provided by the FY 1986 line item project, Safeguards and Site Security Upgrade, Phase II. The access control equipment to be installed includes PPIV, metal detectors, gamma radiation, and package search.

- Building 4-145, Station 30, entrance on south side of Zone 4. This subproject is complete.

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

- Entrance for construction workers and material on west side of Zone 12 South at Station 88. Relocate an existing hardened security station such that it is outside the Perimeter Intrusion Detection and Assessment System (PIDAS) area. This subproject is complete.

- Building 12-114, Station 8, personnel and vehicular entrance on the south side of the Material Access Area (MAA). Provide six PPIV booths.

c. Subproject 03 - Electronic Enhancements c/

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$73,520	$42,631	$14,250	$6,900	$9,739	$0	4th Qtr. FY 1993 - 4th Qtr. FY 1997

This subproject is for the replacement and enhancement of electronic security systems at the Pantex Plant.

Upgrading and enhancing the security systems include the responsibility to integrate as well as to modernize. Secured radio broadcasts will add to the security effectiveness at Pantex. Following are the detailed descriptions:

- PIDAS: The existing PIDAS in Zones 4 and 12 have been in place for several years. Both systems have aged and are increasingly difficult to maintain. As a first line of defense against intruders into SNM areas and as a means of detecting insiders attempting to escape with stolen material, it is important for PIDAS to perform as well as possible.

- ISAS: The Interior Security Alarm Systems (ISAS) are also several years old and are of many incompatible varieties. The ISAS will be replaced with a single integrated system providing a composite risk reduction of 2-3 orders of magnitude, a single-man-machine interface, a single maintenance program and the reliability of a redundant system.

- ADS: The Aircraft Detection System (ADS) is required in order to detect the intrusion of rotary or fixed wing aircraft into the plant. The topographical features of the Pantex Plant include flat, treeless terrain with no tall buildings. Such terrain does not inhibit low flying or landing aircraft.

- Radio Communications: With the standard radio equipment currently in use by the Security Division at Pantex, transmissions can be received by anyone using a scanning radio receiver and they may make unauthorized use of information from such reception. Broadcasting by unauthorized persons and/or frequency jamming using Pantex frequency assignments could, at a minimum, inconvenience security operations. If done so as a diversionary maneuver by a hostile threat, serious damage could result. Installation of the new radio equipment and new procedures would greatly reduce the ability to disrupt radio communication operations. Radio communications for Special Response Team members will be Data Encrypted Signal (DES).

- Compartmentation: Compartmentation provides additional protection against the outsider and reduces the risk against the insider. To the outside, Compartmentation offers another obstacle and at the very least an additional delay because each work area becomes a vault which is in a locked condition. To the insider, Compartmentation is a deterrent that makes it harder to accomplish his goal. To security, Compartmentation increases the delay time for the outsider and reduces the number of potential insiders possible in a particular area. Compartmentation also raises the number of insiders needed to accomplish successfully their goal, thus making detection of the insider easier. Compartmentation is an effective method of reducing the risks associated with the insider threat by

c/ The Weapons Material Tracking System (WMTS) was deleted from the scope of work for Electronic Enhancements. Remaining WMTS funds were allocated to Electronic Enhancements contingency to cover increases in design and construction.

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

limiting the number of personnel with access to production work areas. Independent, as well as "in-house," security analysis initiated Compartmentation, based on assessments of targets, insider vulnerability, and procedural noncompliance.

d. Subproject 04 - Central Shipping and Receiving Facility

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$5,930	$5,930	$0	$0	$0	$0	3rd Qtr. 1992 - Completed

This subproject provided design and construction for a Central Shipping/Receiving Facility (CSRF) at the Pantex Plant.

Construction of this subproject was completed during the first quarter of FY 1994.

e. Subproject 05 - Perimeter Lighting System

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$350	$350	$0	$0	$0	$0	3rd Qtr. FY 1993 - Completed

Construction of this subproject was completed during the 4th quarter of FY 1995.

f. Subproject 06 - Weapons Tactics and Training Facility

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$5,500	$1,000	$0	$4,500	$0	$0	1st Qtr. FY 1996 - 2nd Qtr. FY 1997

The principle purpose of this subproject is to provide centralized arms training and qualification capabilities for the Pantex Security force and the DOE/Albuquerque Operations Office Transportation Safeguards Division. The WTTF will also provide the capability for implementation of advanced live-fire training concepts, neutralization of hostile forces tactics, stress/decision shooting, and night-fire training. In addition, both organizations will use the WTTF for research, development, and evaluation purposes.

The existing firing range facilities are undersized and cannot adequately accommodate the growth that has been experienced by the Security force. Also, the current facilities do not provide the capability to train guards in "shoot-don't-shoot" and tactical situations. This type of training is presently done in the production area.

The WTTF shall consist mainly of the following subprojects:

- M-16 Rifle Range
- Practical Pistol Course 2 (PPC)
- Training/Support Facility
- One Tactical Firing Range
- Shooting House

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The approximate size of the WITF's support buildings are:

	Net Square Feet
Training/Support Facility	8,600
Shooting House (No Roof)	2,400
Approximate Total	11,000

The remaining subprojects are nonstructural firing range areas that are enclosed on three sides by earth berms.

g. Subproject 07 - Physical Training Facility

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,500	$500	$0	$2,000	$0	$0	1st Qtr. FY 1996 - 1st Qtr. FY 1997

The purpose of this subproject is to provide a centralized, permanent facility for the physical training of the Pantex Security Force. Three mobile trailers are currently being used for interim physical training to meet the requirements established by the DOE. However, these facilities were not designed for this purpose. Consequently, the physical training program must be limited to that which can be housed in such structures. A permanent structure is needed to provide adequate facilities for a physical training program.

This subproject provides for the design and construction of the Physical Training Facility (PTF). The upgrade of the existing running track a subproject of the PTF was completed during the fourth quarter of FY 1993. The approximate size of this PTF facility will be 11,000 gross square feet. The proposed site for the PTF is located in Zone 12, northwest of the Security Command Center (Building 1275) and north of the existing running track.

h. Subproject 08 - Alternate Command Posts (ACP)

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$3,100	$3,100	$0	$0	$0	$0	2nd Qtr. FY 1994 - 4th Qtr. FY 1995

At the present time, Plant security operations are monitored through the Security Command Center. All alarms and calls are fed to the Communications Room, the situation is evaluated, and security personnel are dispatched as necessary. The armory for the protective force is also in the Security Command Center.

The primary purpose of this subproject is to provide an alternate alarm gathering and communications center. These alternative alarm annunciation point will be provided in the production area, Zone 12 South, and will be continuously manned by security personnel. An alarm shall sound in the SCC, with a backup alarm sounding in the ACP, this, providing a redundant alarm annunciation system. This will reduce the vulnerability of the Security Command Center and enhance Plant Security.

The ACP shall be a hardened concrete structure. The ACP shall be approximately 2,900 gross square feet in area with parking for 15 vehicles. The alarm collection building in Zone 4 will be approximately 300 gross square feet.

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

i. Subproject 09 - Upgrade Staging Magazine Headwalls

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$86	$86	$0	$0	$0	$0	3rd Qtr. FY 1992 - 3rd Qtr. FY 1992

This subproject provided for the procurement and installation of concrete headwall barriers at 22 staging magazines in Zone 4 West.

This project was completed during the 3rd Qtr. FY 1992.

j. Subproject 10 - Isolation Area Fence Enhancement

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,337	$2,337	$0	$0	$0	$0	3rd Qtr. FY 1994 - 4th Qtr. FY 1995

This subproject consists of the installation of paved roads adjacent to the isolation area security fence in Zone 12 South. Roads will be provided on both sides of the fence to allow security vehicles to patrol the entire perimeter of the isolation area in a continuous circuit. Existing plant roads will be used where they provide unobstructed travel and are in close proximity to the fence. Paved shoulders and drainage ditches will be provided on each side of the road. Rolling doors will be installed at all ramp crossings. Some sections of ramp and security fence will be relocated to provide sufficient space to construct the roads.

k. Subproject 11 - Protected Area Guard Towers

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$1,994	$1,994	$0	$0	$0	$0	4th Qtr. FY 1994 - 4th Qtr. FY 1995

This subproject consists of the design and construction of four reinforced concrete guard towers, access roads, and associated site work. Two towers will be located in the Pantex Plant's production area, Zone 12 South, and two in the staging area, Zone 4 West.

The station (top) level of the towers will have a floor elevation of approximately 34 feet above the natural grade. Floor area of the station will be approximately 130 square feet enclosed by reinforced concrete walls and roof and bullet-resistant window assemblies. Access to the station level will be through an enclosed stairwell consisting of four levels. Gunports will be provided on all sides at each level. The station level will be equipped with a combination electric heating and cooling unit to maintain an acceptable working environment. Each tower will be equipped with monitoring equipment integrated with the existing PIDAS to provide alarm information to security personnel. A communication system will be provided to allow contact with the Security Command Center and other guard towers.

l. Subproject 12 - Security Command Center Expansion

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$2,033	$2,033	$0	$0	$0	$0	3rd Qtr. FY 1994 - 4th Qtr. FY 1995

The purpose of this subproject is to provide the Security organization with an expanded communication/computer room in order to house the ADP equipment associated with the Electronic Enhancements Subproject.

8. Project Description, Justification and Scope (Continued)

The site selected for the expansion is the north area of the existing command center. The addition will be constructed adjacent to the existing Communication Room and Computer Room. Existing utilities include electrical power, domestic water, fire protection/water, sewer and gas.

This addition will consist of a one room addition, approximately 2,340 gross square feet to be utilized for computer equipment. The room will include a raised computer floor integrated into the existing rooms, electrical power, fire protection (wet pipe and Halon 1301), and emergency air supply and power for computer equipment.

This addition will be constructed of precast concrete panels and will be tornado resistant.

Some of the general types of equipment which will be housed in this additional 2,340 gross square feet are:

- Computers and peripherals
- Uninterruptable power supply (UPS)
- Consoles
- Closed circuit television (CCTV) switches, recorders, and monitors
- Radio gear.

9. Details of Cost Estimate

SUBPROJECTS	ED&I	CONST	STD EQUIP	CONTINGENCY	TEC
a. SNM Component Staging Facility	$ 3,346	$ 17,600	$ 700	$ 654	$ 22,300
a1. SNM Component Staging Facility Backfit	0	2,500	0	0	2,500
b. Protected Area Enhancement	898	1,935	0	17	2,850
c. Electronic Enhancements	15,334	49,631	1,500	7,055	73,520

i. Upgrade Staging Magazine Headwalls	7	79	0	0	86
j. Isolation Area Fence Enhancement	226	1,993	0	118	2,337
k. Protected Area Guard Towers (4 towers)	198	1,679	0	117	1,994
l. Command Center Expansion	298	1,542	0	233	2,033
m. Total project cost	$ 22,490	$ 89,268	$ 3,470	$ 9,772	$125,000

The December 1986 Data Sheet submission of Security Enhancement project consisted of 34 subprojects. Subsequent to the FY 1988 submission, a reassessment of security needs was performed. A number of the smaller subprojects were accomplished by other means, some were combined, and some were no longer required. The number of subprojects has been reduced to 12. The FY 1986 submission with a cost estimate of $127 million included $17.3 million for uncertainties. Subsequent cost estimates have not provided for uncertainties.

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

10. Method of Performance

The design services (Studies, Title I, Title II, and partial Title III) will be accomplished by outside A-E firms and will be administered by the Department of Energy or the Operating Contractor (Mason & Hanger-Silas Mason Co., Inc.).

The construction services of this project will be performed by outside construction contractors operating under fixed-price, lump-sum contracts to be awarded on the basis of competitive bids. These contracts will be administered by DOE, Corps of Engineers and/or the Operating Contractor. The construction contractors will perform all work in accordance with the construction documents.

All equipment not specified to be procured and/or installed by the construction contractors will be procured and/or installed by the operating contractor (Mason & Hanger-Silas Mason Co., Inc.).

Construction Management Services will be performed by the Corps of Engineers, DOE, Operating Contractor, and/or by a construction management firm under contract to DOE or the Operating Contractor.

Final connections for new security alarms, fire alarms and specific communications equipment will be accomplished by the Operating Contractor.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	FY 1998	Total
a. Total project costs						
1. Total facility costs						
(a) Line item (Section 9.m.)	$ 52,553	$ 34,754	$ 18,239	$ 16,454	$ 3,000	$ 125,000
(b) Plant, Engineering and Design (PE&D)	0	0	0	0	0	0
(c) Operating expense funded equipment	0	0	0	0	0	0
(d) Inventories	0	0	0	0	0	0
(e) Total facility costs (Federal and Non-Federal)	$ 52,553	$ 34,754	$ 18,239	$ 16,454	$ 3,000	$ 125,000
2. Other project costs						
(a) R&D necessary to complete construction	$ 0	$ 0	$ 0	$ 0	$ 0	$ 0
(b) Conceptual design costs	250	0	0	0	0	250
(c) Decontamination and Decommissioning (D&D)	0	0	0	0	0	0
(d) NEPA documentation costs	0	0	0	0	0	0
(e) Other project related costs	4,110	200	250	190	0	4,750
(f) Total other project costs	$ 4,360	$ 200	$ 250	$ 190	$ 0	$ 5,000
(g) Total project costs	$ 56,913	$ 34,954	$ 18,489	$ 16,644	$ 3,000	$ 130,000
(h) LESS: Non-Federal contribution	0	0	0	0	0	0
(i) Net Federal total project cost (TPC)	$ 56,913	$ 34,954	$ 18,489	$ 16,644	$ 3,000	$ 130,000

b. Related annual costs (estimated life of project--30 years)	
1. Facility operating costs	$14,437
2. Facility maintenance and repair costs	6,000
3. Programmatic operating expenses directly related to the facility	375
4. Capital equipment not related to construction but related to the programmatic efforts in the facility	0
5. GPP or other construction related to programmatic effort in the facility	0
6. Utility costs	200
7. Other costs	0
Total related annual costs	$21,012

1. Title and Location of Project: Security Enhancement, Pantex Plant, Amarillo, Texas (Continued)	2a. Project No.: 88-D-123 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item -- Narrative not required.
   (b) PE&D -- None.
   (c) Operating expense funded equipment -- None.
   (d) Inventories -- None.

2. Other project costs
   (a) R&D necessary to complete construction -- None.
   (b) Conceptual design -- Includes conceptual budget estimate, development of design criteria, conceptual designs, preparation of Conceptual Design Report, and current conceptual cost estimate.
   (c) Decontamination and Decommissioning -- None.
   (d) NEPA documentation -- None.
   (e) Other project related funding -- Startup, etc.

b. Related annual costs

Annual costs began with operation of subproject 04 in FY 1992. Total annual costs as shown will begin in FY 1998 when the project is scheduled to be complete. The estimated useful life of the project is 30 years, with regular software maintenance of the security alarm system.

1. Facility operating costs -- Approximately 85 M&O and 3 DOE FTEs are required to operate all facilities, which replace other facilities and equipment.
2. Facility maintenance and repair costs -- Approximately 32 FTEs are required to maintain the facilities and equipment.
3. Programmatic operating expenses directly related to the facility -- The programmatic effort required consists of software updates and related application revisions.
4. Capital equipment not related to construction but related to the programmatic efforts in the facility -- None.
5. GPP or other construction related to programmatic effort in the facility -- Narrative not required.
6. Utility costs -- Narrative not required.
7. Other costs -- None.

Weapons Stockpile Management
Radiological\Nuclear Accident Response Program

The Radiological\Nuclear Accident Program provides the capability to immediately respond to radiological accidents/incidents worldwide. The assets providing this capability include the: 1) Aerial Measuring System (AMS), 2) Atmospheric Release Advisory Capability (ARAC), 3) Accident Response Group (ARG), 4) Federal Radiological Monitoring and Assessment Center (FRMAC), 5) Nuclear Emergency Search Team (NEST), 6) Radiological Assistance Program (RAP), and 7) Radiation Emergency Assistance Center/Training Site (REAC/TS). The funding for this Program is allocated to fifteen nation-wide Department locations with the Nevada and Albuquerque Operations Offices, and the Los Alamos, Lawrence Livermore, Sandia National Laboratories receiving the majority of the funding.

PROGRAM GOALS:

- Ensure the maintenance of DOE's technical and operational capabilities for responding to radiological accidents/incidents worldwide
- Monitor environmental impacts of radiation at major DOE and other Federal agency facilities
- Support DOE's resolution of accidents and significant incidents worldwide involving nuclear weapons in DOE and DoD custody
- Support DOE's lead role for establishing and managing the FRMAC
- Support the operations, exercise, and maintenance of associates who provide technical assistance in responding to a threat by an individual or group to detonate a nuclear explosive or scatter nuclear material
- Provide for DOE's first responder assistance for initially addressing an accident or incident involving radiological materials
- Provide DOE's medical and health physics support to radiological accidents and incidents resolution

CHANGE FROM FY 1996:

FY 1997 program increase is due to the Office of Emergency Response activities to plan, conduct, and participate in the FY 1997 DOE Lead Federal Agency (LFA) full-field Nuclear Weapon Accident Exercise, and to conduct validation of operational readiness by participating in two interagency overseas deployment exercises.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Participated in a continental United States (CONUS) full-field nuclear incident response exercise - Participated in 3 no-notice outside continental United States (OCONUS) interagency field exercises - Continued to develop and improve equipment to provide successful resolution to a nuclear incident - Hosted the U.S./Canadian Emergency Response Workshop - Participated in the DoD-sponsored weapons accident exercise	- Participate in 4 exercises to maintain and validate operational readiness of the emergency response assets - Complete the design, development, and utilization of specific unique equipment to perform assessments and evaluations of damaged nuclear components - Maintain and operate the DOE/DP aviation assets as FY 1995 - Participate in FY 1996 OCONUS exercise	- Sponsor and participate in the DOE Lead Federal Agency Weapons Accident exercise - Continue to evaluate and validate mission and operational readiness of the DOE emergency response assets - Participate in no-notice call-outs/emergency deployment readiness evaluations and Laboratory specific readiness drills - Complete development of disablement and diagnostic equipment

FY 1995 Continued - Rad\Nuc Accident Response	FY 1996 Continued - Rad\Nuc Accident Response	FY 1997 Continued - Rad\Nuc Accident Response
- Maintained and operated emergency response aviation assets - Maintained 24-hour emergency response capabilities for medical management of radiation accidents	- Complete development and training program for DOE personnel to assume role as LFA	- Continue mission critical projects to provide assessment and containment of damaged weapons and improvised nuclear devices

FUNDING LEVELS:

$60,954	$61,910	$68,800

CAPITAL EQUIPMENTis required to support the Radiological/Nuclear Accident Program. The following are examples of equipment which is needed to support the program: Portable Integrated Video Systems, Mobile Remote Systems, Satellite Communication Systems, Geographic Positioning Systems, Damaged Weapons Containers, Remote Air Samplers, Neutron Radiography, and Gamma Ray Imaging Systems.

CHANGE FROM FY 1996:
The reduced funding level from FY 1996 results from the need for additional operating expenses to support the DOE Lead Federal Agency Weapons Accident Response exercise.

FUNDING LEVELS:

FY 1995	FY 1996	FY 1997
$8,100	$8,100	$7,000

CONSTRUCTION LINE ITEM:

CHANGE FROM FY 1996:
The increase in funding is planned design, procurement, and construction activities for Project **96-D-125, Washington Measurements Operations (WAMO) Facility, Andrews Air Force Base, Camp Springs, Maryland** (TEC $4,725).

FUNDING LEVELS:

FY 1995	FY 1996	FY 1997
$ 0	$ 900	$ 3,825

1. Title and Location of Project: Washington Aerial Measurements Operations (WAMO) Facility
Andrews Air Force Base (AAFB), Camp Springs, Maryland

2a. Project No. 96-D-125
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1996

3b. A-E Work (Titles I & II) Duration: 15 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $ 4,725
Total Project Cost (TPC) -- $ 4,784

4a. Date Physical Construction Starts: 2nd Qtr. FY 1996

4b. Date Construction Ends: 2nd Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $ 4,725
TPC -- $ 4,784

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1996	$ 900	$ 0	$ 900	$ 600
1997	3,825	0	3,825	3,775
1998	0	0	0	350

8. Project Description, Justification and Scope

Construct a secure, two-story building west of Building 1792 at Andrews Air Force Base (AAFB), Camp Springs, Maryland. The first floor of this approximately 22,000-square-foot building will contain alarmed office areas, secure Technical Surveillance Counter Measures (TSCM) working areas, a TSCM training room, a shipping and receiving area, a CRYPTO vault, a secretary/receptionist area, and administrative offices. The upper level will contain a general office area, scientific offices, an emergency response center, a secure conference room, a scientific laboratory, a data-reduction center, and storage areas. This project will also provide the necessary power, water, and sever hookups. The facility will contain heating, ventilation, and air conditioning (HVAC) units; telecommunications hardware; fire and security alarm systems; and an approved fire-control system for both levels. Work includes relocation and installation of an existing nearby 20-foot by 20-foot pre-engineered relocatable building.

FY 1997 funds will be used for design, procurement and construction activities.

Current space is inadequate to meet programmatic requirements assigned. The Washington Aerial Measurements Operators (WAMO) Facility is an emergency response organization with a real response time of two hours. This organization is the initial DOE on-scene response for over 40 percent of the United States (where 84 percent of the nation's nuclear facilities are located) and for Off-Continent United States (OCONUS). Required resources are inadequately postured for rapid deployment due to space limitations and inadequate facilities. Desired personnel and equipment cannot be added due to a lack of space. Equipment clutter creates daily safety risks, and time is lost because frequently used equipment and tools cannot be readily accessed.

1. Title and Location of Project: Washington Aerial Measurements Operations (WAMO) Facility Andrews Air Force Base (AAFB), Camp Springs, Maryland (Continued)	2a. Project No. 96-D-125 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Although the WAMO Facility has had a net increase of 23 personnel, 1 aircraft, 4 vehicles, and over 600 items of accountable equipment, there has been no accompanying increase in space nor major facility modifications. Professional personnel are working in 50-square-foot cubicles. Because equipment must be stacked and randomly stored as unoccupied space permits, organized rapid emergency deployment is both extremely difficult and frequently hazardous. Only 25 percent of the WAMO Facility personnel can occupy the one existing conference room simultaneously; consequently, mandatory training must be repeated four and five times. Functional integrity of the organization has become haphazard because common functions cannot be grouped together due to space limitations.

WAMO is an organization created and strategically positioned to provide DOE with timely and effective emergency response in the eastern USA and overseas. If this initiative is deferred or delayed, the desired emergency response service will not be possible. The sole limiting factor to attaining the essential response time is the inadequacies and inefficiencies of the existing facility. All other avenues for acquiring space have been explored and rejected.

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 537
(1) Engineering design and inspection at approximately 12.2 percent of construction costs	$ 416	
(2) Construction management costs	0	
(3) Project management at 3.5 percent of construction costs	121

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- will provide sufficient funds to construct this facility.
      (b) PE&D -- None.
      (c) Operating expense funded equipment -- None.
      (d) Inventories -- None.

   2. Other project costs
      (a) R&D necessary to complete construction -- None.
      (b) Conceptual design -- A conceptual design cost of $40,000 was necessary to develop a budget-quality cost estimate and construction schedule in FY 1990; an additional cost of $5,000 was necessary in FY 1992 to update and reissue the previous conceptual design report; $5,000 was necessary for miscellaneous budget documents.
      (c) Decontamination and Decommissioning (D&D) -- None.
      (d) NEPA documentation -- $8,700 for Environmental Evaluation.
      (e) Other project related costs -- None.

b. Related annual costs
   1. Facility operating costs -- This activity covers all staffing activities.
   2. Facility maintenance and repair costs -- $0 per year.
   3. Programmatic operating expenses directly related to the facility -- $0 per year.
   4. Capital equipment not related to construction but related to the programmatic effort in the facility -- $0 per year.
   5. GPP or other construction related to the programmatic effort in the facility -- None.
   6. Utility costs -- None.
   7. Other costs -- None.

FY 1997 CONGRESSIONAL BUDGET REQUEST
WEAPONS STOCKPILE MANAGEMENT

RECONFIGURATION

Weapons Stockpile Management
Reconfiguration Program

The Reconfiguration Program (Nonnuclear) supports the transfer and consolidation of 25 activities from the Mound, Pinellas, and Rocky Flats Plants to the Kansas City Plant, Savannah River Site, LANL, and SNL. This includes the transfer and the requalification of 25 technologies and processes at the various receiver sites.

PROGRAM GOALS:
- Modify or upgrade existing facilities at the Receiver Sites
-Transfer or procure capital equipment for the Receiver Sites
-Requalify Activities at the Receiver Sites

CHANGE FROM FY 1996:
FY 1997 program decrease is due to program progression and the completion of the majority of the transfer activities required to reconfigure the weapons complex.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Supported the transfer of remaining activities and the requalification of production capability at the receiver sites. - Initiated requalification activities for the following technology transfers: mechanical assemblies at KC; neutron generators at SNL; and gas transfer systems, nonnuclear acorn and reservoir surveillance operations at SR. - Completed construction activities for lightning arrestor connectors, nonnuclear acorn, and reservoir fabrication at KC; and miliwatt generator heat sources at SNL.	- Support the transfer of remaining activities and the requalification of production capability at the receiver sites. - Completed requalification activities for lightning arrestor connectors at KC and miliwatt generator heat sources at SNL. Initiated requalification activities for thermal batteries at SNL. - Completed construction activities for neutron detectors, nuclear grade steel , optoelectronics, safe secure trailers, support pads, and transducers at KC; and neutron generators and thermal batteries at SNL.	- Support the transfer of remaining activities and the requalification of production capability at the sites. - Initiate requalification for flats cable products at KC and complete requalification activities for neutron detectors, nonnuclear acorn and support pads at KC. - Complete construction activities for flat cable products, mechanical assemblies and roundwire detonators at KC; beryllium technology and pit support at LANL; and gas transfer systems and reservoirs surveillance operations at SR.

FUNDING LEVELS:

$94,271	$80,000	$25,000

CONSTRUCTION LINE ITEM:

CHANGE FROM FY 1996:
The change from FY 1996 under Project **93-D-123, Nonnuclear Reconfiguration, Complex 21, Various Locations** (TEC:$163,860) results from program progression and the completion of the majority of construction activities required to reconfigure the weapons complex.

The FY 1997 funding will be used to support the following subprojects: ICF Target Loading, Neutron Tube Target Loading and Beryllium Technology at the Los Alamos National Laboratory, and Gas Transfer Systems and Reservoir Surveillance Operations at the Savannah River Site.

FUNDING LEVELS:

FY 1995	FY 1996	FY 1997
$58,000	$41,065	$14,487

WEAPONS ACTIVITIES
(Tabular dollars in thousands. Narrative material in whole dollars.)

Stockpile Management

1. Title and Location of Project: Nonnuclear Reconfiguration, Complex-21, Various Locations	2a. Project No.: 93-D-123 2b. Construction Funded

SIGNIFICANT CHANGES

- TEC changed from $166,552,000 to $163,860,000 resulting from the use of $2,692,000 in prior year balances to offset the FY 1996 Weapons Activities appropriation.
- Construction end date changed from 1st Qtr. FY 2001 to 3rd Qtr. FY 1998.
- Neutron Tube Target Loading: TEC increased from $4,115,000 to $12,799,000. Initial plans called for relocation and reestablishment of this activity at TA-21. Since that time, DOE has directed that all tritium related work be phased out of TA-21 due to operational and safety concerns. Subsequently, an interim plan, proposed consolidation of the NTTL activities in the Weapon Engineering Tritium Facility (WETF) at TA-16, which also supports tritium operations. This plan has now been fully documented and will require additional ES&H upgrades to existing TA-16 facilities. The TEC increase incorporates the change in location and required upgrades to assure appropriate ES&H safeguards.
- Pit Support Function: TEC decreased from $4,233,000 to $2,145,000. TEC decrease due to a reassessment of donor and receiver site capital equipment transfer costs and requirements.
- Beryllium Technology: TEC increased from $10,836,000 to $12,125,000. TEC increase due to reassessment of cost estimate.
- Gas Transfer Systems and Reservoir Surveillance Operations: TEC decreased from $42,905,000 (cumulative) to $36,950,000. TEC decrease due to DOE Independent Cost Review; realignment of costs to conform with AL project WBS elements; better utilization of existing facilities; reduction in number of Bell Jars; deletion of mezzanine and mods to HVAC and other support systems in RTF; developmental Tritium loading to be accomplished by modifying existing loading line rather than upgrading Loading Line 6; and deletion of the Component Development Lab (735-11A).
- High Power Detonators: SNL/N.M. TEC decreased from $849,000 to $649,000; LANL TEC decreased from $4,750,000 to $3,320,000, and LLNL TEC decreased from $450,000 to $150,000. TEC decrease results from mission requirement and estimate refinement.

WEAPONS ACTIVITIES
(Tabular dollars in thousands. Narrative material in whole dollars.)

Stockpile Management

1. Title and Location of Project: Nonnuclear Reconfiguration, Complex-21, Various Locations

2a. Project No.: 93-D-123
2b. Construction Funded

3a. Date A-E Work Initiated: 3rd Qtr. FY 1993

3b. A-E Work (Title I & II) Duration: Ongoing

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $166,552
Total Project Cost (TPC) -- $200,755

4a. Date Physical Construction Starts: 2nd Qtr. FY 1994

4b. Date Construction Ends: 3rd Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $163,860
TPC -- $198,063

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs a/
1993	$ 26,000	$ 0	$ 26,000	$ 171
1994	25,000	0	25,000	12,309
1995	58,000	0	58,000	39,599
1996	41,065	(2,692) b/	38,373	61,154
1997	14,487	0	14,487	48,627
1998	2,000	0	2,000	2,000

a/ Utilization of FY 1993 and FY 1994 funds was impeded due to unexpected events dramatically affecting project execution and, thereby, resulting in significant carryover and reutilization of FY 1993 appropriations in FY 1994 and FY 1995. Planned activities were significantly delayed and altered due to delays in finalizing the NEPA FONSI, mission changes due to the June 1992 Bush-Yeltsin Agreement (START II Treaty of 1/93), as well as supplemental Congressional studies, requested prior to utilization of funds and associated with dual need equipment.

b/ $2,692,000 used for FY 96 budget reduction.

1. Title and Location of Project: Nonnuclear Reconfiguration, Complex-21, Various Locations	2a. Project No.: 93-D-123 2b. Construction Funded

8. Project Description, Justification, and Scope

As a result of new mission requirements, the Nuclear Reconfiguration activities have been deleted from this project.

Due to mission downsizing, the construction end date changed from 1st Qtr FY 2001 to 3rd Qtr FY 1998.

"Complex-21" is the Department of Energy's designation for a reconfigured nuclear weapons complex which will provide the nuclear weapons to support the Nation's nuclear deterrent policy through the middle of the next century. The mission of the Nuclear Weapons Complex is now focused on ensuring the viability of the enduring nuclear weapons stockpile. This requires the DOE to support four major activities: (1) limited life component exchanges; (2) the Stockpile Evaluation Program: (3) repairing or replacing weapons components as needed; and (4) upgrading to improve stockpile safety, security, and reliability.

The Nonnuclear Reconfiguration Project involves consolidating the activities from three donor sites, the Mound, Pinellas, and Rocky Flats plants, into five receiver sites; the Kansas City Plant, the Sandia National Laboratories/New Mexico, the Los Alamos National Laboratory, Lawrence Livermore National Laboratory, and the Savannah River Site.

The current Complex comprises 11 government-owned, contractor-operated major facilities, distributed over 10 states. Many of them were constructed 30-40 years ago, were sized to meet programmatic workloads substantially larger and more diverse than those expected in the future, and were designed and built to standards and regulations very different and less stringent than those of today.

In January 1991, the then Secretary of Energy announced that the Department would prepare a programmatic environmental impact statement (PEIS) examining alternatives for the reconfiguration of the nuclear weapons complex (the Complex). The framework for the Reconfiguration PEIS was described in the January 1991 Nuclear Weapons Complex Reconfiguration Study, a detailed examination of alternatives for the future Complex. Because of the significant changes in the world since January 1991, especially with regard to projected future requirements for the United States' nuclear weapons stockpile, the Department has concluded that the framework described in the Reconfiguration Study does not exist today. Contributing factors to this conclusion include public comment at the September-October 1993 PEIS scoping meetings, the fact that no new nuclear weapons production is required for the foreseeable future, budget constraints, and the Department's decision to prepare a separate PEIS on Storage and Disposition of Weapons-Usable Fissile Nuclear Materials. As a result of these changed circumstances, the Department separated the Reconfiguration PEIS into two separate PEIS documents: a Tritium Supply and Recycling PEIS which was completed in October 1995, and a Stockpile Stewardship and Management PEIS to be completed in December 1996.

Consistent with the Secretary of Energy's Record of Decision (ROD), announced on December 6, 1995, the Department is proceeding with a dual-track strategy to assure a future tritium source. One track will explore the purchase of an operating or partially complete Commerical Light Water Reactor (CLWR). The second track will be to design, build, and test critical components of an accelerator system for production of tritium (APT). Both the CLWR and APT options will be developed through 1998 before a down-selection of the preferred technology is undertaken. As part of the ROD, if an APT facility is built, it will be located at the Savannah River Site (SRS), and an extraction facility for CLWR targets would also be built at SRS.

Consolidation of the nonnuclear manufacturing is separate from the above PEIS efforts and was evaluated separately utilizing an Environmental Assessment which resulted in a Finding of No Significant Impact (FONSI) in September 1993.

The Nonnuclear Reconfiguration project will consolidate the nonnuclear portion of the nuclear weapons production complex.

1. Title and Location of Project: Nonnuclear Reconfiguration, Complex-21, Various Locations	2a. Project No.: 93-D-123 2b. Construction Funded

8. Project Description, Justification, and Scope (continued)

An Environmental Assessment (EA) for reconfiguration of the nonnuclear manufacturing facilities was developed separately from the PEIS. It was distributed to the affected states and Indian Tribes for pre-approval review and comment in December 1992. In early 1993, the Cost Effectiveness Report on nonnuclear reconfiguration was submitted to Congress in response to the requirement contained in the Energy and Water Development Appropriations Act for FY 1993 and the National Defense Authorization Act for FY 1993. Three independent consultants were appointed by Secretary O'Leary to evaluate the findings and analysis that supported the cost effectiveness certifications. Their reports were delivered to the Secretary on May 24, 1993, and concluded that the proposed reconfiguration was cost effective and reasonable and that it would not increase the technological environmental, safety, or health risks associated with Departmental facilities. On May 27, 1993, the Secretary announced her decision to proceed with the Environmental Assessment and to publish a proposed Finding of No Significant Impact (FONSI) in the Federal Register, with implementation of the preferred plan to occur after the two events had taken place. A FONSI was issued for the project on September 8, 1993. The plan calls for the consolidation of most nonnuclear activities at the KCP with a few activities assigned to the weapons laboratories to preserve technology. Tritium work presently done at the Mound Plant would be relocated to the Savannah River Site. Reconfiguration of the nonnuclear weapons manufacturing activities is needed to maintain key technologies associated with the design and manufacture of nonnuclear weapons components required to support the enduring stockpile. The collocation of these technologies provides the mechanism to exercise and retain the special skill base necessary to produce and test replacement components.

The Nonnuclear Reconfiguration Project will transfer production operations from Mound Plant (MD), Pinellas Plant (PP), and Rocky Flats Plant (RF) to Kansas City Plant (KCP), Sandia National Laboratories (SNL), Savannah River Site (SR), and Los Alamos National Laboratories (LANL).

SNL will be receiving the following product lines: Neutron Generators Assembly, Milliwatt Heat Source Surveillance (MWHS), High Power Detonators, and Thermal Battery Technologies). SNL will assume surveillance activities for 28 SNL designed components.

KC will be receiving the following product lines: Flat Cable Products, Mechanical Assemblies, Roundwire Detonator Cables/Plastic Headers, Nonnuclear ACORN, Support Pads, Optoelectronics Assemblies, Neutron Detectors, Lightning Arrestor Connectors, Transducers, Reservoir Assemblies and Testing, Nuclear Grade Steel, Safe Secure Trailers, Metrology Services, Sitewide Tasks/Miscellaneous Equipment and Document Storage.

LANL will be receiving the following product lines: Beryllium Technology, Pit Support, Neutron Tube Target Loading, High Power Detonators, Flat Cable Products, and ICF Target Loading. LANL will assume surveillance activities for 13 LANL designed components.

LLNL will assume surveillance activities for 12 LLNL designed components.

SR will receive the following product lines: Gas Transfer Systems, and Reservoir Surveillance Operations.

Incorporation of these product lines intu KC, SNL, LANL, LLNL, and SR facilities will be accomplished by rearranging and upgrading space within existing buildings, transferring equipment from the donor sites, purchasing new product equipment, installation of some of the transferred and new equipment and associated support systems (record storage, etc.). Due to production schedules and other time constraints interim equipment staging and testing may precede final equipment placement and the capital interim activities associated with final placement.

The availability of adequate facilities, the ability to rearrange the existing manufacturing buildings, experience in a variety of product and procurement activities, minimal environmental concerns, and an excellent technical personnel base positions the complex to fulfill their role in nonnuclear manufacturing. To consolidate nonnuclear manufacturing at these locations, funding is required to support construction, rearrangements, procurement, transfer of existing equipment, and installation, as required to accommodate transferred product.

8. Project Description, Justification, and Scope (Continued)

Technology Total Cost includes "donor" and "receiver" capitalized cost at all locations discussed below.

SANDIA NATIONAL LABORATORIES - PRODUCTS TRANSFERRED FROM PINELLAS AND MOUND PLANT: TEC - $54,119,000

Subproject 01: Neutron Generators Facilities (NGF): TEC - $49,591,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 49,591	$ 6,176	$ 29,573	$ 13,842	$ 0	$ 0	3rd Qtr. FY 1994 - 2nd Qtr. FY 1996

TEC decreased from $51,731,000 to $49,591,000. TEC decrease results from mission requirement and estimate refinement.

NGF will have a prototyping, production, and delivery capability for neutron generators with initial shipments beginning in FY 1999. The facility will be sized to meet current Planning and Production Directive schedules with a single shift.

The design strategy is to use and renovate existing buildings to accommodate the functional requirements of the NGF. Eight existing Buildings (870, 842, 860, 878, 882, 891, 6730, and 905) have been identified as part of the NGF. All buildings are located in Tech Area 1, except 6730 and 905; and all buildings are located within a "limited access" area. The primary building for NGF (Building 870) will be renovated and utilized to satisfy the NGF design and prototyping requirements. The scope of work for Building 870 includes demolition and reconstruction of the entire north wing. Portions of the other existing buildings identified above will also be utilized by the NGF although only minor construction and equipment relocations will be necessary.

Subproject 02: Cap Assemblies: TEC - $1,353,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 1,353	$ 1,353	$ 0	$ 0	$ 0	$ 0	Project terminated

Subproject 03: Milliwatt Heat Source Surveillance and Thermal Battery Technologies: TEC - $2,526,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 2,526	$ 611	$ 1,732	$ 183	$ 0	$ 0	3rd Qtr. FY 1995 - 3rd Qtr. FY 1996

TEC decreased from $3,078,000 to $2,526,000. TEC decrease results from mission requirement and estimate refinement.

The design strategy is to use and renovate a portion of Building 894, to accommodate the functional requirements of the Power Sources (PS) Facility. A portion of Building 894 is currently being used for the thermal battery facility. Approximately 6,125 square feet of floor space adjacent to the existing PS Facility will undergo a complete renovation. Total building square footage required is approximately 9,200 square feet, of which 8,975 square feet is existing.

8. Project Description, Justification, and Scope (continued)

Site work will include the removal of the large argon and nitrogen tanks and associated concrete equipment pads, concrete steps and landings, gas bottle storage area, and vacuum pump. A new gas bottle storage facility will be constructed along with a new concrete loading dock and stairs, concrete ramps, and hazardous materials storage room. Building will be designed with all applicable codes and standards.

Subproject 04: High Power Detonators: SNL/N.M.: TEC - $649,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 649	$ 0	$ 649	$ 0	$ 0	$ 0	4th Qtr. FY 1995 - 4th Qtr. FY 1996

TEC decreased from $849,000 to $649,000. TEC decrease results from mission requirement and estimate refinement.

The transfer of HE Component Surveillance activities from Mound is documented in the High Power Detonator Activity Transfer Plan. The SNL/N.M.-specific HE Component Surveillance activities are directly linked to the LANL High Power Detonator activity transfer. Surveillance activities involve twenty-eight SNL/N.M. components. A HQ programmatic decision has been made to have the surveillance activities reside at the design laboratory responsible for each specific component. Incorporation of this product line will be accomplished by rearranging and upgrading space within existing facilities, and purchasing new product equipment.

LAWRENCE LIVERMORE NATIONAL LABORATORY - PRODUCTS FROM MOUND: TEC - $150,000

Subproject 05: High Power Detonators: LLNL: TEC - $150,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 150	$ 100	$ 50	$ 0	$ 0	$ 0	4th Qtr. FY 1995 - 4th Qtr. FY 1996

TEC decreased from $450,000 to $150,000. TEC decrease results from mission requirement and estimate refinemnent.

The transfer of HE Component Surveillance activities from Mound is documented in the High Power Detonator Activity Transfer Plan. The LLNL-specific HE Component Surveillance activities are directly linked to the LANL High Power Detonator activity transfer. Surveillance activities involve twelve LLNL components. A HQ programmatic decision has been made to have the surveillance activities reside at the design laboratory responsible for each specific component. Incorporation of this product line will be accomplished by rearranging and upgrading space within existing facilities, and purchasing new product equipment.

KANSAS CITY PLANT - PRODUCTS TRANSFERRED FROM MOUND PLANT: TEC - $6,945,000

Subproject 06: Flat Cable Products: TEC - $555,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 555	$ 555	$ 0	$ 0	$ 0	$ 0	4th Qtr. FY 1994 - 2nd Qtr. FY 1996

An approximate 1,000 square feet of space is required for the Flat Cable technology that will be located within the Main Manufacturing

8. Project Description, Justification, and Scope (continued)

Building. The Project rearranges an existing department and builds a new wall to separate this department from the Flat Cables area. Intermediate partitions, some lights, sprinkler heads, utility piping and duct-work will be relocated or added. Procurement will consist of the transfer of donor site equipment.

Facility space will be provided in vacant areas to allow initiation of development work and staging of equipment prior to the preparation of final facility space. This is required to move the technology prior to the cessation of donor site activities. The KCP will be responsible for cable production and PVD bridge.

Subproject 07: Mechanical Assemblies: TEC - $1,195,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 1,195	$ 460	$ 735	$ 0	$ 0	$ 0	2nd Qtr. FY 1994 - 4th Qtr. FY 1995

An approximate 2,200 square foot area is required for this technology. Modification to an existing Class 100,000, clean room is required to provide space for some of the transferred MD equipment. Procurement consists of deionization grids which will be installed on existing clean benches. Rearrangements are also required within the existing Class 100,000, clean room and a laser welder room to establish this capability. The rearrangements consist of relocating existing equipment and modification of utilities.

Subproject 08: Roundwire Detonator Cables/Plastic Headers: TEC - $655,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 655	$ 655	$ 0	$ 0	$ 0	$ 0	4th Qtr. FY 1994 - 2nd Qtr. FY 1996

An approximate area of 1,000 square feet is required for this technology. There is no construction required to establish this capability. Procurement consists of shape and slot machines, resistance welder, ultrasonic welder, vacuum oven, and portable desiccator chamber. Minor rearrangements are required to establish transferred equipment on existing workbenches with existing departments at KC.

Subproject 09: Nonnuclear ACORN: TEC - $4,540,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 4,540	$ 2,045	$ 2,495	$ 0	$ 0	$ 0	2nd Qtr. FY 1994 - 4th Qtr. FY 1995

An approximate area of 1,500 square feet is required for this technology. Facility space will be provided in vacant factory areas to allow initiation of development work and staging of equipment prior to the preparation of final facility space. This is required to move the technology prior to the cessation of donor site activities. Equipment to be procured includes: assembly equipment, glove boxes, ultrasonic cleaner, vacuum bake station, welder, flow tester, and lab equipment. Area rearrangement consists primarily of relocation of equipment, and modification to utilities.

8. Project Description, Justification, and Scope (continued)

KANSAS CITY PLANT - PRODUCTS TRANSFERRED FROM PINELLAS PLANT: TEC - $1,587,000

Subproject 10: Lithium Ambient Batteries (LAMB): TEC - $0

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 0	$ 0	$ 0	$ 0	$ 0	$ 0	Deleted from KC Mission

Subproject 11: Support Pads: TEC - $320,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 320	$ 105	$ 215	$ 0	$ 0	$ 0	1st Qtr. FY 1995 - 3rd Qtr. FY 1995

An approximate area of 460 square feet is required for this technology. There will be no construction activity or procurement of new capital equipment required to establish this capability at KC. The Support Pads will be molded/foamed within the existing foam molding department. Minor rearrangement will be required within an existing welding department to transfer the flame spray process.

Subproject 12: Optoelectronics Assemblies: TEC - $180,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 180	$ 0	$ 180	$ 0	$ 0	$ 0	3rd Qtr. FY 1995 - 2nd Qtr. FY 1996

An approximate area of 800 square feet is required for this technology. Work will consist of only obtaining from the donor site and storing the transferred equipment at the Kansas City Plant.

Subproject 13: Neutron Detectors: TEC - $57,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 57	$ 27	$ 30	$ 0	$ 0	$ 0	2nd Qtr. FY 1994 - 1st Qtr. FY 1996

An approximate area of 700 square feet is required for this technology. Transferred equipment and utilities will be rearranged as required to install transferred equipment.

8. Project Description, Justification, and Scope (continued)

Subproject 14: Lightning Arrestor Connectors; TEC - $940,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 940	$ 685	$ 255	$ 0	$ 0	$ 0	4th Qtr. FY 1994 - 3rd Qtr. FY 1995

An approximate area of 3,300 square feet is required for this technology. Construction includes building a 300 square foot Lead Titinate room for the handling of lead in the Materials Engineering Laboratory. A 250 square foot Class 100 clean room will be purchased and installed to support LAC production equipment located in the Electrical Products Manufacturing Building (EPMB). Lead Titinate equipment will not be transferred to KC due to lead contamination. New equipment will be procured for Lead Titinate including a flammable cabinet, rolling machine, hooded sink, shelves, ovens, benches and hoods. Equipment presently occupying the project locations will be moved or excessed.

Subproject 15: Transducers; TEC - $90,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 90	$ 90	$ 0	$ 0	$ 0	$ 0	1st Qtr. FY 1995 - 3rd Qtr. FY 1995

An approximate area of 500 square feet is required for this technology. There will be no construction activity required to establish this capability at KC. A rearrangement of an existing KC 3-bay tester, a 2-bay tester, two single bay testers, one desk, and existing sputtering equipment will be required to provide space for the equipment relocated from PP and equipment being purchased.

KANSAS CITY PLANT - PRODUCTS TRANSFERRED FROM ROCKY FLATS PLANT: TEC - $29,271,000

Subproject 16; Reservoir Assemblies and Testing; TEC - $17,163,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 17,163	$ 13,549	$ 2,189	$ 1,425	$ 0	$ 0	2nd Qtr. FY 1994 - 2nd Qtr. FY 1997

An approximate area of 29,700 square feet is required for this technology. Approximately 1,600 square feet containing wood block flooring will be removed and treated as hazardous waste. The site preparation work for this facility will include the demolition and removal of metal clad gypsum board and coreboard partitions and removal of steel mesh crib security fencing. The concrete factory floor in the Heavy Machining Department will also be removed and replaced. New construction will include installation of metal stud and gypsum board partitions and enclosures, acoustical ceilings, resilient flooring, and hollow metal doors and frames. The new construction will also include a 12-inch thick reinforced concrete factory floor in part of the area, structural steel framing for equipment platforms, bridge cranes, and reinforced concrete containment sumps to capture effluent from cleaning lines.

The metal stud and gypsum board construction will provide rooms and partition walls to house coordinate measuring machines, general inspection area, cleaning lines, ancillary machining equipment, a metallurgical lab, and a swaging operation. Procurement will consist of a laser marker, engine lathe, tool presetter, crush grinder, rotary swager, tube bender, electro-chemical marker, pinch welder, heat oven, vacuum braze furnace, ultrasonic testing equipment, machining accessories, X-ray system, tube testers, leak testers, and miscellaneous equipment.

8. Project Description, Justification, and Scope (continued)

Facility space will be provided in vacant factory areas to allow initiation of development work and staging of equipment prior to the preparation of final facility space. This is required to move the technology prior to the cessation of donor site activities.

Subproject 17: Nuclear Grade Steel/Oxnard; TEC - $1,159,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 1,159	$ 540	$ 619	$ 0	$ 0	$ 0	3rd Qtr. FY 1994 - 1st Qtr. FY 1996

An approximate area of 8,800 square feet is required for this technology. Installation of a bridge crane is required. Site work involved will require removal and replacement of the factory floor to accommodate the capability. Excavation and compaction of the footing sub-grade will also be required. Procurement will consist of a band saw, tube scanner, bar tester, and storage racks. Rearrangement within the existing vacant area will consist of modifications to existing utility systems. Facility space will be provided in vacant areas to allow for interim storage of steel because of earlier closure date at the donor site.

Subproject 18: Safe Secure Trailers; TEC - $10,949,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 10,949	$ 9,428	$ 1,521	$ 0	$ 0	$ 0	3rd Qtr. FY 1994 - 4th Qtr. FY 1996

An approximate area of 29,400 square feet is required for this technology. The Forge and Casting building will be modified to accommodate trailer production. An existing concrete masonry unit wall will be demolished. Five ton capacity bridge cranes with supporting steel structures will be installed. Paint booth and other processes will require new exhaust systems. An office and a foam/lytherm application area will be constructed. A basement area will be renovated to provide restrooms, break area, and locker room. An 8 foot partitioned area will be constructed for handling explosives. The area will be provided with the necessary alarms and hardware for a limited access area. Equipment to be procured includes welders, lifts, cutting equipment, sheet metal equipment, miscellaneous small tools for trailer work, office furniture and locker room accessories. Approximately 13,000 square feet of storage racks and contents will be relocated to provide space for Safe Secure Trailers.

Subproject 19: Weapon Trainer Shop; TEC - $0

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 0	$ 0	$ 0	$ 0	$ 0	$ 0	Deleted from KC Mission

8. Project Description, Justification, and Scope (continued)

Subproject 20: Metrology Services: TEC - $0

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 0	$ 0	$ 0	$ 0	$ 0	$ 0	Existing facilities and equipment at KC will be used.

There are no facilities or equipment required to transfer Metrology Services to KC. Existing facilities and equipment at KC will be used. There are no costs associated with the transfer of this technology.

KANSAS CITY PLANT - SITEWIDE TASKS: TEC - $3,249,000

Subproject 21: Sitewide Tasks/Miscellaneous Equipment and Document Stores: TEC - $3,249,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 3,249	$ 293	$ 851	$ 2,105	$ 0	$ 0	4th Qtr. FY 1994 - 3rd Qtr. FY 1997

Miscellaneous Equipment: In addition to the items identified for each technology to be transferred to the KCP, there are many items of miscellaneous equipment required. These multiple use items are required to produce the additional products transferred to the KCP but cannot be identified against a specific technology.

Document Storage: Documentation on existing products at donor sites will be relocated to the KCP and may require the preparation of suitable space.

LOS ALAMOS NATIONAL LABORATORY - PRODUCTS TRANSFERRED FROM MOUND PLANT: TEC - $4,520,000

Subproject 22: High Power Detonators and Flat Cable Products: TEC - $3,320,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 3,320	$ 1,850	$ 1,139	$ 331	$ 0	$ 0	4th Qtr. FY 1994 - 4th Qtr. FY 1999

TEC decreased from $4,750,000 to $3,320,000. TEC decrease results form mission requirement and estimate refinement.

To support the transfer of High Power Detonator activities to LANL, minor modifications to Building 16-340 and an explosive storage magazine will be made. The required process equipment will be relocated from MD where practical and the balance will be acquired through new procurement.

LANL will be responsible for fabricating stated bridges, bonding of bridges and cables, and test fire. No additional floor space will be required, only minor modifications to existing facilities is required. These mission assignments were transferred from the KC Flat Cable Products mission scope.

1. Title and Location of Project: Nonnuclear Reconfiguration, Complex-21, Various Locations	2a. Project No.: 93-D-123 2b. Construction Funded

8. Project Description, Justification, and Scope (continued)

Existing space at TA-16 will be utilized to receive the transfer of the technology from Mound.

Subproject 23: ICF Target Loading; TEC - $1,200,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 1,200	$ 0	$ 300	$ 500	$ 400	$ 0	3rd Qtr. FY 1995 - 4th Qtr. FY 1997

LOS ALAMOS NATIONAL LABORATORY - PRODUCTS TRANSFERRED FROM PINELLAS PLANT: TEC - $12,799,000

Subproject 24: Neutron Tube Target Loading; TEC - $12,799,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 12,799	$ 2,713	$ 5,239	$ 2,847	$ 2,000	$ 0	2nd Qtr. FY 1994 - 1st Qtr. FY 1997

TEC increased from $4,115,000 to $12,799,000. Initial plans called for relocation and reestablishment of this activity at TA-21. Since that time, DOE has directed that all tritium related work be phased out of TA-21 due to operational and safety concerns. Subsequently, an interim plan, proposed consolidation of the NTTL activities in the Weapon Engineering Tritium Facility (WETF) at TA-16, which also supports tritium operations. This plan has now been fully documented and will require additional ES&H upgrades to existing TA-16 facilities. The TEC increase incorporates the change in location and required upgrades to assure appropriate ES&H safeguards.

Building 209 at TA-21 will be used as the location of the interim facility for the Neutron Tube Target Loading technology program at the LANL. Existing space at TA-16 will be utilized as the permanent location for the NTTL technology. The interim facility is required to move the technology prior to the cessation of donor site activities. The consolidation activities include Tritium Target Loading and Target Loading Verification. The loading of neutron tube targets will be accomplished by installing a glovebox line in Building 209. A small portion of an existing concrete frame structure will be modified to accept this glovebox line. The glovebox line will house a target loader, vacuum pump for the loader, and will have ancillary equipment consisting of a mass spectrometer, calorimeter, film dissolution station, thermal desorption with fume hood, and related piping, power, instrumentation, controls, etc.

FY 1997 funds will be used to complete construction and installation.

LOS ALAMOS NATIONAL LABORATORY - PRODUCTS TRANSFERRED FROM ROCKY FLATS PLANT: TEC - $14,270,000

Subproject 25: Pit Support Function; TEC - $2,145,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 2,145	$ 995	$ 1,150	$ 0	$ 0	$ 0	2nd Qtr. FY 1996 - 3rd Qtr. FY 1997

TEC decreased from $4,233,000 to $2,145,000. TEC decrease due to a reassessment of donor and receiver site capital equipment transfer costs and requirements.

Building 66 at the TA-3/SIGMA site will be upgraded to accommodate the consolidation of the Pit Support technology maintenance program to be transferred from RF to LANL. Relocation of some equipment and pertinent records to continue to support the Pit Support mission is required.

8. Project Description, Justification, and Scope (continued)

Subproject 26: Beryllium Technology: TEC - $12,125,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 12,125	$ 815	$ 1,773	$ 3,840	$ 5,697	$ 0	3rd Qtr. FY 1997 - 3rd Qtr. FY 1997

TEC increased from $10,836,000 to $12,125,000. TEC increase due to reassessment of cost estimate.

Building 141 at the TA-3 will be upgraded to accommodate the consolidation of the Beryllium Technology maintenance program to be transferred from RF to LANL. It is necessary to provide for continued vendor support and back-up capability to maintain small lot fabrication capability after the planned closure of RF. Relocation of some equipment and pertinent records to continue to support the Beryllium Technology mission is required.

FY 1997 funds will be used to complete construction and installation.

SAVANNAH RIVER SITE - PRODUCTS TRANSFERRED FROM MOUND PLANT: TEC - $36,950,000

Subproject 27: Gas Transfer Systems and Reservoir Surveillance Operations: TEC - $36,950,000

TEC	Previous	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
$ 36,950	$ 7,955	$ 7,305	$ 13,300	$ 6,390	$ 2,000	1st Qtr. FY 1995 - 3rd Qtr. FY 1998

TEC decreased from $42,905,000 (cumulative) to $36,950,000. TEC decrease due to DOE Independent Cost Review; realignment of costs to conform with AL project WBS elements; better utilization of existing facilities; reduction in number of Bell Jars; deletion of mezzanine and mods to HVAC and other support systems in RIF; developmental Tritium loading to be accomplished by modifying existing loading line rather than upgrading Loading Line 6; and deletion of the Component Development Lab (735-11A).

At the Savannah River Site, this project provides funds for the location of new operations in an expansion area of Building 233-H and renovated areas of Building 232-H, Building 735-11A. A Reservoir Surveillance Operations (RSO) facility, to be located in 233-H, provides equipment to subject stockpile tritium reservoirs to a variety of environmental conditions such as thermal and mechanical shock, vibration, and centrifugal forces, and then function test them to verify adequate performance. This equipment will be located in isolated, sealed rooms tied into tritium stripper systems. A variety of other analytical capabilities are needed to perform gas analyses, calorimetry, leak and flow tests, and destructive examination to support both pre and post function activities. In addition, tritium loading for commercial sales and inertial confinement fusion microspheres will be performed in Building 233-H. New verification and service systems for Buildings 232-H and 233-H will be sized for economical expansion.

Facility space will be provided in vacant factory areas to allow initiation of development work and staging of equipment prior to the preparation of final facility space. This is required to move the technology prior to the cessation of donor site activities and required production schedules.

One area will be renovated to accommodate additional shelf storage and environmental chambers to conduct storage studies needed for support of Acorn Reservoir Programs. A second area in 232-H to be renovated will house equipment for hydrostatic burst testing. Space within an existing building will be used for a helium purification system.

In a third building, 735-11A, one area will be renovated to establish process development capabilities for support of Acorn reservoir prototype fabrication.

FY 1997 funding will be used to conduct design and construction.

10. Method of Performance

Design and inspection will be performed under negotiated architect-engineer contracts or by operational contractor. Construction will be by fixed price contracts awarded after competitive proposals and administered by the DOE and Contractor staff. However, operating contractor personnel may perform design and construction roles for activities determined to be cost effective. Procurement of standard equipment will be administered by the DOE and Contractor staff on the basis of competitive proposals.

Weapons Stockpile Management
Tritium Source

The Tritium Source Program will assure the availability of adequate supplies of tritium to meet the requirements of the enduring stockpile. In keeping with the Secretarial Record of Decision announced in December 1995, over the next three years, the Department will pursue a dual-track strategy for a new, assured source of tritium. One track will explore the purchase of an operating or partially complete commercial light-water reactor or the purchase of irradiation services from such a reactor. The second track will be to design, build, and test critical components of an accelerator system for production of tritium and prepare a design for the actual facility. The Department will select one of the alternatives at a later date to serve as the primary source of tritium for the nuclear weapons stockpile. The other alternative would be developed as a back-up source.

The Department's Savannah River Site has been selected as the location for an accelerator, should one be built. The tritium recycling facilities at the Site will be upgraded and consolidated to support either of the dual-track options. A tritium extraction facility will also be constructed at the Site.

PROGRAM GOALS:
- Acquire an assured source of tritium
- Implement Record of Decision for dual-track until 1998
- Support project office activities to manage implementation of the Secretarial Record of Decision

CHANGE FROM FY 1996:
FY 1997 program for Tritium Source is increased over FY 1996 due to increased activities in support of project initiation.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Published a draft Programmatic Environmental Impact Statement for Tritium Supply and Recycling for public review and comment - Conducted pre-conceptual design activities - These activities were funded under the Reconfiguration Program	- Secretarial Record of Decision announced in December 1995 - Establish a Project Office to manage implementation of the Secretarial Record of Decision APT Project ($62 million) - Initiate accelerator production of tritium demonstration - Initiate conceptual design - Initiate site-specific NEPA & Environmental Assessment activities - Procure services of prime engineering contractor CLWR Project ($13 million) - Initiate commercial light water reactor project including CLWR target development, extraction capability, and reactor acquisition/initial tritium operation activities	- Support Project Office activities to manage implementation of the Secretarial Record of Decision APT Project ($85 million) - Continue accelerator production of tritium demonstration CLWR Project ($15 million) - Continue commercial light water reactor project including: CLWR target development, extraction capability, and reactor acquisition/initial tritium operation activities. - Make conditional selection of reactor(s) for purchase and/or providing irradiation services

Weapons Stockpile Management
Materials Surveillance

The Materials Surveillance Program (formerly the Materials Surveillance and Technical Support Program) funds the storage, handling, shipping, safeguarding, control and accountability, and disposition for Defense Programs (DP) nuclear materials located at facilities and former DP facilities that have been transferred to Environmental Management at the Rocky Flats, Fernald, Hanford, Idaho, and Savannah River sites. This program also supports programmatic activities that include: the operation of Bldg 9206 at Y-12 Plant until phaseout and transfer to Bldg 9212; decontaminate and refine surplus precious metals; operation of U-233 Storage and Distribution Center; coordination with U.S. Enrichment Corporation for sale of excess low enriched uranium; safeguards and security protection for, and disposition of DP-owned special nuclear materials (SNM) at Rocky Flats, Fernald, Idaho, Hanford, and Savannah River.

PROGRAM GOALS:

- Provide for safeguards and surveillance of DP plutonium; monitoring & storage of depleted, normal, low and highly enriched uranium; plan for disposition (transfer, sale, discard) of depleted, normal & low enriched uranium.
- Oversight/Operation of Central Scrap Management Office for uranium scrap consolidation & closure of Building 9206 at Y-12 Plant.
- Consolidation of surplus precious metals into DOE precious metals pool.
- Continued safe operation of the U-233 Storage and Distribution Center in Building 3019 at the Oak Ridge National Laboratory.
- Manage processing of irradiated Mark 42 targets for weapons R&D and manage sale & loan program for Californium-252.
- Oversee LANL program to receive and process excess plutonium-beryllium sources from universities, etc.
- Continue implementation of lithium sales at the OR K-25 Plant and the Portsmouth Gaseous Diffusion Plant.

CHANGE FROM FY 1996:

FY 1997 program for Materials Surveillance is essentially level with FY 1996.

MEASURABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Consolidation of surplus precious metals into DOE precious metals pool - Began planning to ship 64 metric tons of Hanford uranium (MTU) and 212 MTU of Fernald uranium to Allied Signal Inc., and 706 MTU of Hanford uranium to United Kingdom - Continued shipment of 200 MTU of Fernald uranium to Manufacturing Sciences Corp	- Began shipment of 706 MTU of excess uranium billets to the United Kingdom - Begin to relocate/consolidate remaining excess uranium out of surplus facilities to a centralized storage location - Complete shipment of 200 MTU of Fernald uranium to Manufacturing Sciences Corp - Began transfer of 212 MTU of Fernald normal uranium to Allied Signal - Began shipment of surplus lithium hydroxide to buyers	- Complete shipment of 706 MTU of excess uranium billets to the United Kingdom - Continue to relocate/consolidate any remaining excess uranium out of surplus facilities to a centralized storage location - Complete shipment of 212 MTU of Fernald normal uranium to Allied Signal - Continue shipment of surplus lithium hydroxide to buyers

PROGRAM DIRECTION

PROGRAM MISSION

[NOTE: Detailed site funding by object class for FY 1995, FY 1996, and FY 1997 is provided in Defense Programs Executive Budget Summary.]

Program Direction provides funds for all personnel-related expenses, capital equipment, and contractual services for Defense Programs offices at the Department of Energy Headquarters and the Albuquerque, Nevada, Oak Ridge, Oakland, and Savannah River Operations Offices. The departmental Working Capital Fund, established to fund business-type activities traditionally financed in the Departmental Administration account, is funded from this decision unit. The statutory Community Assistance Program at Los Alamos, New Mexico, is also funded from Program Direction.

The *GOAL* of Program Direction is to provide oversight of Defense Programs changing mission which has shifted from weapons and materials design, testing, and production to stockpile stewardship, maintenance, weapons dismantlement and the transition of unneeded facilities. These ongoing responsibilities will be accomplished by streamlining and strengthening the management, organization, performance, and oversight of the Defense Programs national security activities by providing competent and sufficient staff and support services to carry out successfully assigned activities.

The *OBJECTIVES* related to this goal are:

- Provide management and oversight of the $1.6 billion Stockpile Stewardship program and $1.8 billion Stockpile Management program.

- Provide Federal couriers and personnel-related costs for the Transportation Safeguards Program at Albuquerque.

- Assure that business services, including phones and automated office support systems, copiers and office supplies, are available to Defense Programs staff.

- Provide for statutory requirements, including the Los Alamos Community Assistance Program.

PROGRAM DIRECTION - PROGRAM MISSION (Continued)

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS

- Since FY 1992, streamlined Defense Programs by reducing the FY 1992 full-time equivalents (FTEs) level of 495 at Headquarters to 366 through FY 1995, redeploying staff to meet evolving needs.

- Since FY 1993, Defense Programs has reduced organizational elements at Headquarters from 71 to 24, a reduction of 47 components, about 66 percent, and eliminated all Division (third-tier) components, resulting in a reduction of managers/supervisors from 89 to 28. The current ratio of supervisors to employees is 1:12.

- Quality training for all Defense Programs employees completed, as well as numerous other technical and professional courses attended by Defense Programs employees.

- Achieved Defense Programs Strategic Alignment Initiative reduction in support services contracting and travel at Headquarters and field locations.

- Safeguards and Security investigations at the Oakland Operations Office were reduced to adhere to new guidance, thereby realizing a reduction in the amount of clearances required and the associated cost.

- Established the National Ignition Facility Project Office at the Oakland Operations Office/Lawrence Livermore National Laboratory by redeploying existing staff and funding resources.

- Eliminated internal and external appraisals of the Lawrence Livermore National Laboratory where the University of California/Lawrence Livermore National Laboratory self-assessments are validated as accurate by Oakland.

- At Albuquerque, Information Management Strategic Alignment Initiative realized approximately $2 million savings in the following areas: applications development, fewer repair calls, and reduced training courses.

- The IBM mainframe equipment maintenance contracts at Albuquerque were combined into one, resulting in a savings of approximately $100,000 per year.

- Continued implementation of the Chief Financial Officers Act of 1990 and the Federal Managers' Financial Integrity Act process to promote improved financial and business practices at the Department of Energy contractor facilities.

BUDGET STRUCTURE CHANGES

In accordance with guidance contained in H.R. 104-293, FY 1996 Energy and Water Development Appropriations Conference Report, Defense Programs Federal staff and supporting contractual services funding has been transferred from the Stockpile Stewardship and Stockpile Management decision units to the Program Direction decision unit. The Department's Working Capital Fund, established to fund business-type activities, is transferred from the Departmental Administration account. These transfers to the Program Direction decision unit are reflected in Table 1-A and Table 1-B.

The **Defense Nuclear Facilities Safety Board** is funded in the Other Defense Activities Appropriation in FY 1997.

b/ Includes $11,290,000 for the Los Alamos Community Assistance Program.

TABLE I-B

BUDGET STRUCTURE

FEDERAL AND CONTRACTUAL SUPPORT provides funds for general management, executive direction, and general supervision of program operations, negotiations and administration of contracts, and other administrative activities in support of Defense Programs mission at Headquarters and the Albuquerque, Nevada, Oak Ridge, Oakland, and Savannah River Operations Offices. Supports Defense Programs requirements for Automated Office Support Systems, Local Area Network (LAN), communication and video equipment, and other miscellaneous contractual support activities to support Defense Programs operations.

TRANSPORTATION SAFEGUARDS PROGRAM provides funding for Federal FTEs and related contractual support to assure the safe, secure movement of nuclear weapons, strategic quantities of Special Nuclear Material, nuclear test devices, selected nonnuclear weapon components, and limited-life components to and from military locations and between nuclear complex facilities within the continental United States. Operational vehicles and the communications maintenance program is funded in the Stockpile Management Decision Unit.

WORKING CAPITAL FUND provides for activities such as automated office support, telephone services, postage, printing and graphics, supplies, copiers, building occupancy, contract closeouts, contract audits and Senior Executive Service awards and workman's compensation for Defense Programs employees, historically funded in the Departmental Administration account. Responsibility for funding of these activities has been transferred to the Department's program offices; however, management of thse activities still remains with Departmental Administration.

LOS ALAMOS COMMUNITY ASSISTANCE PROGRAM is administered by the Department under Section 91 of Public Law 94-187, the Atomic Energy Community Act of 1955, as amended, to provide assistance to specified units of local government in the Los Alamos community associated with the Los Alamos National Laboratory.

FOOTNOTES:

a/ Use of prior-year balances.

b/ FY 1995 Appropriation: $159,852,000. Adjustments as follows: Travel rescission -$444,000; transfer of $17,336,000 from Weapons Program Direction to the Office of Emergency Management and transfer of $551,000 to the Office of the Assistant Secretary for Environment, Safety, and Health for the Defense Nuclear Facilities Safety Board within the Other Defense Activities Appropriation; transfers to Weapons Program Direction for Federal and Contractual Support as directed in Conference Report 104-293 accompanying the FY 1996 Energy and Water Development Appropriations Bill dated October 26, 1995, as follows: $49,373,000 from Stockpile Stewardship and $167,822,000 from Stockpile Management; and $6,526,000 from Departmental Administration for the Working Capital Fund. New Obligational Authority reduced by $15,299,000 to be applied against use of prior-year balances. Comparable Appropriation $349,943,000.

c/ FY 1996 Appropriation: $115,000,000. Adjustments as follows: Transfer to Weapons Program Direction for Federal and Contractual Support as directed in Conference Report 104-293 accompanying the FY 1996 Energy and Water Development Appropriations Bill dated October 26, 1995, as follows: $47,106,000 from Stockpile Stewardship and $159,215,000 from Stockpile Management. Reflects transfer of $6,612,000 from Departmental Administration for the Working Capital Fund. Reflects transfer of $1,000,000 to the Office of the Assistant Secretary for Environment, Safety and Health for the Defense Nuclear Facilities Safety Board within the Other Defense Activities Appropriation. New obligational authority reduced by $13,400,000 to be applied against use of prior-year balances. Comparable Appropriation: $313,533,000.

FEDERAL AND CONTRACTUAL SUPPORT provides funds for Federal salaries, personal services, personnel benefits, travel, training, supplies, and support services necessary to conduct Defense Programs activities at Headquarters and the Albuquerque, Nevada, Oak Ridge, Oakland, and Savannah River Operations Offices. Activities include general management, executive direction, general supervision of program operations, negotiation and administration of operating contractors and other procurements, weapons complex resource management and planning, technical oversight and review, and the conduct of special programs and activities.

Funding is also provided to cover the anticipated costs related to the Department's Voluntary Separation Incentive Pay Program as follows: lump-sum incentive payment of up to $25,000, a 9 percent surcharge on the final salary of each full-time equivalent departure, and lump-sum payment of accrued annual leave. The Department recently instituted a mechanism by which program offices were delegated authority through the use of credit cards to purchase office products and services in as fast, efficient, and paperless manner as possible due to downsizing of the Headquarters Office of Procurement Operations. To carry out effectively the Defense Programs mission, transfer of this authority to program managers is requested to procure items such as office supplies, rent or purchase of copiers or copier supplies, printing services, messenger services, package delivery services, building alterations, office moves, carpet installation or repairs, and books and publications purchased by the Library within available funds through the credit card process.

PROGRAM GOALS/ONGOING RESPONSIBILITIES:

Headquarters:

- Overall management direction and administration in support of Defense Programs' mission to insure that operations are conducted in the most efficient manner consistent with national security policies and objectives.
- Crosscut planning, budget, and logistical support to all Defense Programs Headquarters program activities.
- Management of Defense Programs training and staff development programs including outreach initiatives.
- Support Defense Programs requirements for Automated Office Support Systems and other communications equipment.

Field Offices:

- Albuquerque Operations Office - Provides for Federal programmatic oversight of the Stockpile Management program and oversight of the weapons plants through area offices. Provides for Federal oversight of the Los Alamos National Laboratory through the Los Alamos Area Office and of Sandia National Laboratories through the Kirtland Area Office.
- Nevada Operations Office - Oversight and administration of the Stockpile Stewardship Program at the Nevada Test Site.
- Oak Ridge Operations Office - Federal oversight of the Y-12 Plant.
- Oakland Operations Office - Federal oversight of the Lawrence Livermore National Laboratory.
- Savannah River Operations Office - Federal oversight of tritium operations at the Savannah River Site.

CHANGE FROM FY 1996:

Increased FY 1997 funding will provide for anticipated costs related to the Department's Voluntary Separation Incentive Pay Program and other Strategic Alignment Initiative activities, and costs associated with the expected transfer of 25 FTEs (15 Headquarters, 10 field) from other department elements in support of Defense Programs mission.

The funding requested to cover the projected cost of the Voluntary Separation Incentive Pay Program for FY 1997 is estimated based on the cost of the program since its inception in FY 1994. Through FY 1996, for Headquarters, 31 Defense Programs staff will have taken advantage of the program at an estimated cost of approximately $1.6 million, an average of $51,600 per buyout. In FY 1997, about 50 applicants at Headquarters are conditionally approved for the Voluntary Separation Incentive Pay Program, 60 percent of which are Grades GS-14, GS-15, and Senior Executive Service positions. In one year, Defense Programs will have exceeded the number of buyouts for the preceeding three years and, with the higher grades, it is possible that the average cost per buyout at Headquarters will be higher. Thus, coupled with our estimate of a similar number of buyouts needed to meet field office SAI targets, supports our estimate of about $5 million for buyouts and related SAI implementation costs.

Other costs related to SAI include the cost of major organizational changes. For example, Defense Programs has established a Core Technical Group, based at Headquarters, to respond to technical problems throughout the Weapons Complex (for I;S&T1 and safeguards and security reviews and/or assessments). The consolidation of these activities will result in reduced Federal employees performing these activities and be more cost-effective with overall department guidance from one location. However, there are upfront investment costs to realize savings and efficiencies in the future.

No change reflected in the Advisory and Assistance Services costs from FY 1996 to FY 1997. Control of support service costs is a key part of the Strategic Alignment Initiative. Support services are grouped into two categories: technical support services and management support services. Based on a preliminary analysis, 95 percent of advisory and assistance contracts are technical and 5 percent are administrative/management support. An implementation group was created to address the department's goals for reducing and controlling these costs. The overall Department's reduction in support services contracts exceeded the goal of a 15 percent reduction in FY 1995. The group established the Department's FY 1996 ceilings and directed the ceilings for FY 1997 be held at the same level. Defense Programs advisory and assistance services from FY 1995 to FY 1996 were reduced 29 percent at Headquarters and approximately 15 percent at the field offices.

EXPLANATION OF AVERAGE FTE COSTS:

Tables 2A through 2G outline average FTE costs, both by total costs and the basic personnel costs, for each Defense Programs site. General reasons for variances in each category are:

AVERAGE PERSONNEL COST PER FTE:

- Locality pay: In FY 1991, the Oakland Operations Office received a 12 percent locality pay increase in addition to the Federal cost-of-living increase. The Department of Energy Headquarters' staff also received a locality pay increase of 4.23 percent in FY 1994. This action increased the base pay per FTE for these two locations which increases the average cost per FTE per year.

- Grade structure: Based on the number of administrative/clerical support positions at grades lower than GS-9 compared to the number of higher grades for programmatic, technical, and managerial positions.

AVERAGE TOTAL COST PER FTE:

- Landlord costs such as rent and utilities, operation and maintenance of facilities, and miscellaneous costs: Defense Programs is landlord for Albuquerque and Nevada, whereas landlord costs are incurred by other programs at Oak Ridge, Oakland, and Savannah River.

- Working Capital Fund: This transfer from Departmental Administration, applicable only at Headquarters, is about $7 million annually and is applied to the following categories by object class: 11.5 Other Personnel Compensation; 12.1 Civilian Personnel Benefits; 23.3 Rent, Communications, Utilities, and Miscellaneous Charges; 24.0 Printing and Reproduction; 25.2 Other Services; 25.4 Operation and Maintenance of Facilities; and 26.0 Supplies and Services.

- Transportation Safeguards Program reflects personnel costs and minimal costs for other services. Program costs such as contractual support are included in the Stockpile Management decision unit since the transportation safeguards activity is direct program, not program support/oversight.

It should be noted that the full-time equivalent allocations upon which the average costs are derived may be changed based on future decisions by the Strategic Alignment Initiative staffing team.

364

MEASUREABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
- Provided salaries, benefits, travel, and contractual services and supplies for Defense Programs Headquarters and field Federal employees necessary to meet program requirements. - Continued Defense Programs training program. - Continued financial improvements and operations consistent with the Chief Financial Officers Act and the Federal Managers' Financial Integrity Act. - Provided oversight of site/plant missions from a legal, environmental, safety, and health (ES&H), programmatic and financial standpoint. - Final year of funding the Capital Assessment Management Process/Condition Assessment Surveys (CAMP/CAS) program from the Program Direction account. - Negotiated a new support service agreement at Albuquerque with the Air Force for electricity, gas, water, sewage, and refuse. - Implemented a Self-Assessment Program at Nevada to include independent assessments in all areas of ES&H, safeguards and security, and program management. - Provided oversight for technology partnerships program reviews at all Oakland M&O contractors with technology transfer authority.	- Provide salaries, benefits, travel, and contractual services and supplies for Defense Programs Headquarters and field Federal employees necessary to meet program requirements. - Continue Defense Programs training program. - Continue financial improvements and operations consistent with the Chief Financial Officers Act and the Federal Managers' Financial Integrity Act. - Provide oversight of site/plant missions from a legal, ES&H, programmatic and financial standpoint. - Institute travel ceilings in accordance with Secretarial initiative to accomplish a reduction in travel costs. - Meet departmental mandate to reduce significantly support service contract expenditures by approximately 20 percent. - Review new initiatives -- Dual-Axis Radiographic Hydrotest Facility (DARHT), National Ignition Facility (NIF), and Accelerated Strategic Computing Initiative (ASCI) -- to assure appropriate safeguards and security is considered in design and implementation. - Support safeguards and security assessments for Defense Programs sites and Defense Programs material inventories subject to International Atomic Energy Agency (IAEA) and other treaty initiatives. - Assure adequate safeguards and security of tritium supply for Defense Programs. - Provide oversight for technology partnerships program reviews at all Oakland M&O contractors with technology transfer authority.	- Provide salaries, benefits, travel, and contractual services and supplies for Defense Programs Headquarters and field Federal employees necessary to meet program requirements. - Continue Defense Programs training program. - Continue financial improvements and operations consistent with the Chief Financial Officers Act and the Federal Managers' Financial Integrity Act. - Provide oversight of site/plant missions from a legal, ES&H, programmatic, and financial standpoint. - Continue to downsize Defense Programs Federal staff and contractual support consistent with long-term mission responsibilities as outlined in the Strategic Alignment Initiatives. - Continue to review new initiatives in DARHT, NIF, and ASCI. - Continue safeguards and security support of assessments for Defense Programs sites and Defense Programs material inventories subject to IAEA and other treaty initiatives. - Assure adequate safeguards and security of tritium supply for Defense Programs. - Provide oversight for technology partnerships at program reviews at all Oakland M&O contractors with technology transfer authority.

TABLE 2-G

TRANSPORTATION SAFEGUARDS PROGRAM at the Albuquerque Operations Office provides for the safe, secure movement of nuclear weapons, strategic quantities of Special Nuclear Material, nuclear test devices, selected nonnuclear weapons components, and limited life components to and from military locations and between nuclear weapons complex facilities within the continental United States.

In compliance with Congressional direction that all Federal staff and supporting contractual services be consolidated into one amount, the full-time equivalents and associated costs for this program have been transferred from the Stockpile Management decision unit. However, to carry out successfully the activities necessary to insure the safe transport of nuclear weapons between military locations, funding for the following activities have remained in Stockpile Management: maintenance and modifications of vehicles and the communication system, production of new Safeguards Transporters, weapons deliveries and stockpile modifications specified in the current Production and Planning Directive, and continued support of weapons movements associated with military base closings. Total funding requested for this activity in FY 1997 is $96.6 million -- $29.7 million in Program Direction; $66.9 million in Stockpile Management.

CHANGE FROM FY 1996:

Increase in personnel expenses is attributable to the increased activity of movement of weapons for dismantlement.

MEASUREABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
Provided for personnel costs and related administrative support activities in connection with the safe handling of nuclear weapons and related activities. Couriers covered approximately 4.4 million miles in support of this activity.	Provide for personnel costs and related administrative support activities in connection with the safe handling of nuclear weapons and related activities. It is estimated that 4.5 million miles will be covered in support of this activity.	Provide for personnel costs and related administrative support activities in connection with the safe handling of nuclear weapons and related activities. It is estimated that 4.6 million miles will be covered in support of this activity.

FUNDING LEVELS:

$27,830	$28,695	$29,731

WORKING CAPITAL FUND is a directive from Departmental Administration which allocates administrative costs to the Headquarters programs or operational functions for which they are incurred. Departmental Administration will continue to manage administrative activities defined in the Working Capital Fund -- automated office support, telephone services, postage, printing and graphics, supplies, copiers, building occupancy (rents), contract closeouts, and contract audits and Senior Executive Service awards and workman's compensation for Defense Programs employees.

PROGRAM GOALS/ONGOING RESPONSIBILITIES as stated by Departmental Administration:

- Increase efficiency of the Departments' operations by having the cost of administrative services reflected in program managers' budgets.

- Improve the management of administrative services through use of flexible and business-like financing methods.

- Provide an accurate full-cost budget for programs and activities, including indirect costs.

CHANGE FROM FY 1996:

Increased funding reflects Departmental Administration's assessment of Defense Programs historical expenditures for categories contained in the Working Capital Fund.

MEASUREABLE PERFORMANCE ACTIVITIES:

FY 1995:	FY 1996:	FY 1997:
Provided for miscellaneous administrative-type activities and building costs in support of Defense Programs. (Comparability estimate only -- these activities were funded in the Departmental Administration account.)	Provided for miscellaneous administrative-type activities and building costs in support of Defense Programs. (Comparability estimate only -- activities funded in the Departmental Administration account.)	Provide for miscellaneous administrative-type activities and building costs in support of Defense Programs. Provides for Senior Executive Service awards and workman's compensation for Defense Programs employees. The Headquarters Working Capital Fund assessments were calculated as follows: Building rent/maintenance based on estimate of where people will be located (percent of total); printing and graphics, copying, postage, supplies based on usage chargeback; and telephones and AOSS based on itemized cost plus rate per line or workstation.

FUNDING LEVELS:

$6,526	$6,612	$7,040

LOS ALAMOS COMMUNITY ASSISTANCE PROGRAM provides assistance payments to the Los Alamos County and the Los Alamos School Board to compensate for the lack of an industrial or commercial tax base for the county. The current contracts with the Los Alamos County municipalities and the Los Alamos County School Board expires June 30, 1996. By authority of Public Law 104-106 FY 1996 National Defense Authorization Act, dated February 10, 1996, assistance payments are authorized to continue through June 30, 1997. If further assistance is required after this time, a report and plan describing the actions required to eliminate the need for further assistance for the school board or the County, including a proposal for legislative action to carry out the plan, is to be provided to the Authorization committees.

PROGRAM GOALS/ONGOING RESPONSIBILITIES:

- Provide assistance according to agreements negotiated under Public Law 94-187, the Atomic Energy Community Act of 1955, as amended.

- In accordance with Section 3161 of H.R. 104-450, Conference Report to Accompany the National Defense Authorization Act for FY 1996, develop a report and plan describing action required to eliminate further assistance.

- Distribution of funding is as follows:

	FY 1995	FY 1996	FY1997
Civic Activities	$ 30	$ 30	$ 30
Los Alamos County Assistance Payments to:			
Municipalities	2,837	2,839	2,839
Schools	8,123	8,421	8,421
	$ 10,990	$ 11,290	$ 11,290

CHANGE FROM FY 1996:

No change in funding.

FUNDING LEVELS:

$ 10,990	$ 11,290	$ 11,290

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ATOMIC ENERGY DEFENSE ACTIVITIES
OTHER DEFENSE ACTIVITIES

PROPOSED APPROPRIATION LANGUAGE

For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other incidental expenses necessary for atomic energy defense weapons activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion, and the purchase of passenger motor vehicles (not to exceed 2 for replacement only), [$1,373,212,000] $1,547,700,000 to remain available until expended.

EXPLANATION OF CHANGE

Changes in appropriation language relate only to the numbers of vehicles to be acquired.

380

In recent years, the worldwide proliferation of Weapons of Mass Destruction (WMD) and their missile delivery systems has emerged as one of the most serious dangers confronting the United States. This is a continuing and evolving problem with far-reaching consequences for international security and stability.

At least 20 countries -- some of them hostile to the United States -- already have or may be developing WMD through the acquisition of dual-use technology, indigenous development and production, and/or support from rogue supplier states.

The President has made nonproliferation one of the nation's highest priorities. As the preeminent agency in nuclear materials and weapons technology and control, the Department of Energy (DOE), through its Office of Nonproliferation and National Security, is uniquely suited to provide leadership in national and international efforts to reduce nuclear weapons worldwide; secure and prevent the spread of nuclear materials, technology and expertise; roll back nuclear weapons development programs; avoid proliferation surprise; and respond to emergencies.

In order to reduce the international proliferation threat, the Office of Nonproliferation and National Security is focusing its resources and expertise on the following near-term priorities:
(1) securing nuclear materials, technology, and expertise in Russia and the Newly Independent States; (2) maintaining effective protection, control, and accountability of nuclear materials, technology, and expertise in the United States; (3) limiting weapons-usable fissile materials worldwide; (4) ensuring transparent and irreversible nuclear reductions worldwide; (5) supporting the completion of a Comprehensive Test Ban Treaty (CTBT) in 1996; (6) developing and integrating a program for preventing, detecting and responding to nuclear terrorism and smuggling; (7) controlling nuclear exports; and (8) strengthening the nuclear nonproliferation regime. Because of the unique scientific, technical, analytical, and operational capabilities of the Department and its National Laboratories, we will effectively and efficiently accomplish these near-term priorities by marshaling and integrating our resources and nonproliferation activities.

Some of our most important international activities include: conducting the government-to-government and laboratory-to-laboratory programs of cooperation between U.S. nuclear experts and their counterparts at nuclear facilities and institutes in the former Soviet Union to improve materials protection, control and accountability; assisting Russia and the Newly Independent States in establishing and enhancing nuclear material export control systems; developing technologies and systems to detect the proliferation of WMD, to monitor and verify existing treaties, and to prepare for the CTBT; conducting critical operations in cooperation with the Democratic Peoples Republic of Korea (DPRK) to stabilize, can, and safely store spent nuclear fuel in the DPRK in order to freeze the North Korean nuclear weapons program and to enable the application of effective IAEA safeguards; working with the private sector to engage WMD weapons

scientists, engineers, and technicians in the former Soviet Union in activities which reduce the proliferation threat, and providing technical support for long-term monitoring of Iraqi facilities and other nuclear safeguards and emergency programs of the International Atomic Energy Agency (IAEA). In addition, we are providing unique and in-depth technical, arms control, intelligence, research and technology expertise as part of the U.S. Government's integrated efforts to conclude negotiations, prepare for entry into force, and implement a CTBT. We also provide emergency management experts to assist other foreign governments in reviews of their emergency preparedness plans and capabilities. DOE continues to contribute to National Intelligence Estimates and to support the Non-Proliferation Center in assessing the activities of emerging nuclear weapons states and terrorist organizations (the demand side of the equation) and nuclear supplier states or other sources, such as theft and smuggling of nuclear materials (the supply side of the equation).

In concert with our international activities, we are responsible for wide-ranging activities to accomplish nonproliferation and national security goals in the United States. These activities include: directing a rigorous safeguards and security program for the entire Department of Energy complex, thereby ensuring the demonstrated security of our own nuclear materials, technology and expertise; declassifying millions of DOE documents while protecting critical information that has the potential to facilitate the proliferation of weapons of mass destruction; managing and improving the Department's emergency management and response capability and providing assistance to other government agencies as well as state, tribal, and local governments; and maintaining a security investigations and reinvestigations program for both Federal and contractor employees of the Department. DOE also provides technical, analytical, policy and implementation support to the efforts of the nation's policy community to deal with nonproliferation issues.

In FY 1997, the Department will achieve its nonproliferation and national security priorities by: (1) accelerating efforts to provide enhanced materials protection, control and accountability for fissile materials in Russia and the Newly Independent States; (2) cooperating with authorities in the former Soviet Union to redirect intellectual capital through the science and technology centers, the Industrial Partnering Program, and export controls; (3) concentrating efforts toward limiting the production and use of weapons-usable fissile materials in the civil sector by reducing and eventually eliminating the use of highly enriched uranium and promoting alternatives to the civil use of plutonium, expansion of the Reduced Enrichment for Research and Test Reactors (RERTR) Program, and by purchasing, where appropriate, at-risk weapons-usable nuclear materials; (4) providing necessary research, technology development, analysis, and training as part of the U.S. Government's efforts to complete and implement a CTBT; (5) developing and implementing an integrated approach to nuclear smuggling, terrorism, and emergency response; (6) confirming Russian and U.S. nuclear weapon dismantlement through mutual reciprocal inspections and other activities which enhance transparency and irreversibility; (7) strengthening the international nonproliferation regime through measures which include our efforts in North Korea, negotiation of an international fissile material cutoff convention and cooperation with and support for the IAEA safeguards programs, including the facilitation of IAEA inspections in the United States. The Department will also maintain an emergency management program for response to domestic hazards and to provide assistance internationally. Finally, in support of all of the Department's nonproliferation capabilities, we will continue to develop technologies and systems for detecting, characterizing, and monitoring proliferant activities worldwide.

NONPROLIFERATION AND VERIFICATION RESEARCH AND DEVELOPMENT

PROGRAM MISSION

The Nonproliferation and Verification Research and Development Program is the only U.S. Government program dedicated to conducting applied research, development, testing, and evaluation of science and technology for strengthening the United States response to the threats to national security and to world peace posed by the proliferation of nuclear weapons and special nuclear materials. Activities center upon the design and production of operational sensor systems needed for proliferation detection, treaty verification, nuclear warhead dismantlement initiatives, and intelligence activities. Included is support for the timely transfer of prototyped and tested systems to operational users, especially other U.S. Government agencies. The program also supports subsequent commercialization of technologies and contributes to the Small Business Innovation Research Program.

The GOAL of the Nonproliferation and Verification Research and Development Program is to:

Enhance U. S. National Security by reducing the global nuclear danger through customer-driven research and development to provide the science and technology required for treaty verification, nuclear material control, and the early detection and characterization of the proliferation of nuclear weapons and special nuclear materials, in both cooperative and non-cooperative environments.

The OBJECTIVES related to this goal are:

1. Develop and demonstrate the technologies needed to detect the early stages of proliferant nations' nuclear weapons development programs.

2. Develop and demonstrate the technologies needed to detect and deter the smuggling of nuclear weapons, components, and special nuclear materials in noncooperative environments.

3. Provide the U.S. Government with the scientific and technical capability to verify existing and future nuclear treaties using sensors and algorithms for detecting, locating, identifying, and characterizing nuclear explosions underground, underwater, in the atmosphere, and in space.

4. Develop and demonstrate technologies for: nuclear materials protection, control, and accounting; nuclear warhead dismantlement cooperative monitoring; confidence building measures; reduction transparency measures; and advanced sensor systems for the intelligence community.

5. Maintain the focused, cost-effective nonproliferation and treaty verification technology base necessary to respond both to current customer requirements and to emerging new threats.

PERFORMANCE MEASURES:

1. Ability to meet customer need dates for delivery of technologies for proliferation detection and arms control verification operational missions.

2. Selection by U.S. nonproliferation and arms control policy community of demonstrated candidate technologies to address current requirements.

3. Development of new sensors/concepts which increase the national capability for early detection of the proliferation of weapons of mass destruction.

4. Successful development of sensors with increased sensitivity which yield higher levels of confidence in worldwide nuclear explosion surveillance capability.

5. New sensors and algorithms developed and provided to customers to enable the U.S. Government to verify a Comprehensive Test Ban Treaty (CTBT).

6. Improvement in U.S. Government technical capabilities to detect and deter nuclear smuggling.

7. Dual-use technology spin-offs that lead to commercialization by U.S. industry of sensors and instruments developed for proliferation detection and treaty monitoring requirements.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Provided continuous worldwide monitoring for atmospheric nuclear explosions by sensors designed, developed, and produced by the Nonproliferation and Verification Research and Development Program and deployed upon the Global Positioning System satellite constellation.

- Successfully operated the Department's first wholly designed, developed, and operated small satellite, an experiment/demonstration called the Array of Low Energy X-ray Imaging Sensors (ALEXIS), which is a test-bed for treaty verification technology.

- Completed the first all-inclusive nuclear proliferation signatures study. The study identifies chemicals used in the nuclear weapons life-cycle from mining to dismantlement. This study will enable future research efforts to focus on high payoff areas.

- Developed measurement technologies and procedures to support the DOE/MINATOM and U.S. /Russian agreements for mutual reciprocal inspections of U.S. and Russian dismantled nuclear weapons and for the purchase of Russian HEU.

- Continued to develop improved lasers and standoff sensors for remote optical detection and characterization of multiple chemical effluents related to proliferation activities.

- Continued development of synthetic aperture radar (SAR) autofocus algorithms, sensitive change detection algorithms, and interferometric SAR (IFSAR) terrain mapping algorithms for treaty verification purposes, and provided DoD with algorithms for their use in battle damage assessment and terrain elevation determination.

- Transferred a significant number of high-risk, high-payoff projects directly to the user community in support of nonproliferation activities.

- Implemented first year of directed responsibility for Comprehensive Test Ban Treaty (CTBT) research and development for underground, underwater, atmospheric, and space nuclear detonation detection.

- Was instrumental in initiating the Presidentially established interagency Nonproliferation and Arms Control Technology Working Group (DOE co-chairs with DOD and ACDA); this group ensures effective interagency coordination of science and technology for arms control and nonproliferation, and guards against redundant programs within and among departments and agencies.

- Provided requested technical support (including monitoring technology and in-country support) for negotiations with North Korea regarding the use and disposition of heavy fuel oil.

- Initiated a focused research effort on countering nuclear smuggling in response to intelligence and law enforcement needs.

NONPROLIFERATION AND VERIFICATION RESEARCH AND DEVELOPMENT

ONSITE SYSTEMS

I. Mission Supporting Goals and Objectives

Develop and demonstrate cooperative and noncooperative handheld and transportable monitoring technologies. Onsite monitoring research and development includes sensor development and integration of unattended inspection technology to support requirements for bilateral and multilateral nonproliferation treaties and agreements on weapons of mass destruction. Radiation detectors, unattended ground sensors, and technology to detect and characterize underground facilities are under development in coordination with other federal agencies.

All of these efforts are focused on the common themes of developing and demonstrating detection technologies and analytical methods for timely support of both current and future U.S. Government policies and initiatives. The program is driven by both evolving and long-standing priorities of the arms control and intelligence communities. This program brings the unique technical expertise of the national laboratories to bear on major nonproliferation and arms control problems and opportunities facing the nation.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Onsite Systems	$ 40,047	$ 39,972	$ 32,972	$ -7,000	-17.5
Total, Onsite Systems	$ 40,047	$ 39,972	$ 32,972	$ -7,000	-17.5

III. Performance Summary:

FY 1995 Accomplishments:

- Developed measurement technologies and procedures to support the DOE/MINATOM agreement for mutual reciprocal inspections of U.S. and Russian dismantled nuclear weapons and the U.S./Russian agreement for the purchase of HEU.

- Participated in the first joint U.S./Russian demonstration and operation of on-site cooperative remote monitoring technologies at selected U.S. and Russian fissile material storage facilities.
- Completed six (6) Airborne Multisensor Pod System (AMPS) airborne missions supporting DOE proliferation detection and other government agency requirements, using state-of-the-art remote sensing systems.
- Demonstrated remote unattended tracking technologies and concepts for nuclear warheads slated for dismantlement.
- Received three "R&D100 Awards" for innovation and technical excellence.

FY 1996 Accomplishments (to date and planned):

- Collected data with the Airborne Multisensor Pod System (AMPS) in response to U.S. Navy and Intelligence Community requirements for advanced data processing and target recognition research and development; formed a partnership with U.S. industry and Kazakstan to collect and share remote sensing data.
- Developed remote cooperative monitoring systems for implementation by the IAEA to enhance global safeguards.
- Commercialized radiation detection systems and demonstrated a portable gas chromatograph/mass spectrometer.
- Demonstrated and field tested geophysical methods to detect underground structures in support of Department of Defense Counterproliferation Program.
- Continued to develop micro-sensor technologies for nonproliferation applications.
- Completed field trials of measurement concept for estimating plutonium production from graphite reactors.
- Developed technology for International Atomic Energy Agency (IAEA) implementation of the Presidential offer regarding excess special nuclear materials from the U.S. weapons program.
- Initiated a program to enhance field and laboratory capabilities for nuclear smuggling forensic analysis.

FY 1997 Planned Accomplishments:

- Develop alternate safeguards technologies to support negotiations between U.S. and member states of the Treaty on the Nonproliferation of Nuclear Weapons (NPT).
- Continue the development and field testing of advanced radiation and chemical sensors to support forensics analysis in response to nuclear smuggling.
- Complete remote unattended cooperative monitoring sensors development programs.
- Conduct full field test of methods and technologies to detect underground facilities from an airborne platform.
- Exploit micro-technologies for use in cooperative hand-held and remote unattended sensor systems.

Explanation of funding changes from FY 1996 to FY 1997

- TERMINATE AIRBORNE MULTISENSOR POD SYSTEM (AMPS).
  - o All existing sensors pods used to test and evaluate multisensor data fusion concepts will be redirected.
  - o Tools to reduce data overload and to merge data from multiple sensors will not be developed to identify possible proliferant activities.
  - o Multisensor data will no longer be provided to other participating civil federal and state agencies, defense agencies, the intelligence community, and nongovernmental organizations for their applications; and will no longer be available on Internet to universities and other potential users.

391

REGIONAL MONITORING SYSTEMS

I. Mission Supporting Goals and Objectives:

Develop and demonstrate technologies for nuclear proliferation detection in two program areas: Comprehensive Test Ban Treaty Research and Development (CTBT R&D) and Effluent Detection and Analysis Research and Development. CTBT R&D, in preparation for both international and U.S. national verification of a CTBT, addresses seismic monitoring, hydroacoustic monitoring, atmospheric radionuclide monitoring, infrasound monitoring, on-site inspection, and automated data processing. The Effluent Detection and Analysis Research and Development program area develops real time, field-deployable systems to detect very low level concentrations of chemicals indicative of proliferation activities.

On August 11, 1995 President Clinton stated, "One of my administration's highest priorities is to negotiate a Comprehensive Test Ban Treaty.... I am committed to pursuing a comprehensive research and development program to improve our treaty-monitoring capabilities and operations." National responsibility for executing CTBT R&D has been consolidated in this Department of Energy program.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Regional Monitoring Systems	$ 38,640	$ 40,297	$ 38,197	$ -2,100	-5.2
Total, Regional Monitoring Systems	$ 38,640	$ 40,297	$ 38,197	$ -2,100	-5.2

392

III. Performance Summary:

FY 1995 Accomplishments:

- Initiated a seismic field test program using mining blasts of opportunity already being conducted by the U.S. mining industry. The cooperative program results in the ability to discriminate seismic signals generated by various mining practices from seismic signals generated from underground nuclear explosions, while the mining industry receives data that can help them improve their operations.
- Began acquisition of basic geological and geophysical information for the Middle East, North Africa and western China as a first step in developing region specific seismic event location and discrimination algorithms.
- Developed and began field testing at McClellan AFB of a fully automated near real time radionuclide particulate sampler/analyzer.
- Reaffirmed the value, through peer review, of monitoring the noble gas xenon as a integral part of international monitoring system. Developed a laboratory prototype xenon collection/analysis system specific to the CTBT international monitoring application.
- Developed preliminary specifications for a fixed hydroacoustic cabled system appropriate for use in the international monitoring systems.
- Initiated studies of acoustic blockage to help propose locations for deployment of the international hydroacoustic monitoring assets.
- Refined and tested transmission of infrasound data to the Air Force Technical Applications Center (AFTAC) in their role as the U.S. National Data Center under a CTBT and began the estimation of proposed network detection capabilities in support of technology monitoring options under negotiation for a CTBT at the Conference on Disarmament.
- Developed proof of concept prototypes for new types of event detection algorithms and analyst event evaluation displays for CTBT monitoring.
- Completed initial design of a CTBT knowledge base. This knowledge base will contain the results of all research areas to aid in automated data processing of events.
- Completed a computer model to predict the travel time, relevant to on site inspection under a CTBT, of radioactive noble gases from a nuclear explosion to the surface and determined that seismicity from mining activity can resemble nuclear explosion aftershock sequences under certain conditions.

- Developed and demonstrated a new generation of instruments that provide more timely analyses of environmental samples for key nuclear proliferation effluent signatures using real-time detection, improved field collection methods, and automated laboratory techniques.

- Began field testing of instruments that provide standoff detection of airborne signatures by unique infrared and millimeter-wave spectrometry.

- Transferred to customers four effluent analysis instruments that will reduce costs and provide more timely and reliable analyses using automation techniques.

- Completed the first all-inclusive nuclear proliferation signatures study. The study identifies chemicals used in the nuclear weapons life-cycle from mining to dismantlement. This study will enable future research efforts to focus on high payoff areas.

FY 1996 Accomplishments (to date and planned):

- Continue to characterize seismic signals from mining blasts of opportunity representative of mining practices used by the U.S. mining industry. Conduct with the U.S. Army Corp of Engineers field experiments addressing the effectiveness of decoupling (muffling) seismic signals in cavities of varying configurations and in different geologic media. The decoupling results will aid in the ability to analyze seismic signals for CTBT monitoring purposes.

- Continue acquisition of basic geological and geophysical information for the Middle East, North Africa and western China. This information will lead to ways to make seismic discrimination more portable from one region to the next, despite major geologic structure differences.

- Complete field testing at McClellan AFB of a fully automated near real time radionuclide particulate sampler/analyzer and initiate commercialization.

- Initiate field testing of a prototype xenon collection/analysis system specific to the CTBT international monitoring application.

- Develop refined specifications for a fixed hydroacoustic cabled system appropriate for use in the CTBT international monitoring systems and facilitate international commercial availability of a such a system.

- Continue the study of deep water acoustic coverage worldwide and test proposed hydroacoustic networks against credible evasion scenarios.
- Complete the selection of appropriate wide band infrasound sensors and continue the estimation of proposed network detection capabilities; initiate prototype development of CTBT infrasound station for the U.S. National Data Center.
- Evaluate prototypes for event detection and discrimination algorithms and analyst event evaluation displays.
- Develop optimal on site inspection techniques for extracting radioactive noble gases from the soil, assess the utility of low-frequency electromagnetic pulse detection for declared explosion confirmation, and assess indicators of shocked ground.
- Complete development of two standoff spectrometry instruments for transfer of technology to customers and commercial manufacturers.
- Fabricate a prototype unit to user specifications for rapid, nondestructive elemental analysis of solids.
- Develop microminiaturized instrumentation to reduce the size and costs of chemical analysis for detection of nuclear proliferation signatures.

FY 1997 Planned Accomplishments:

- Complete and evaluate geophysical and geological models for the Middle East, North Africa and western China, synthesize results into the CTBT knowledge base for automated data processing of events, and transfer models to customers for testing.
- Deliver algorithms for regional seismic discrimination to customer for testing and provide expert advice to support implementation.
- Plan, conduct and complete procedures for calibration of newly installed seismic arrays and participate in internationally planned field experiments.
- Test and finalize development of an automated near-real-time radionuclide particulate sampler/analyzer.
- Complete field testing of a prototype xenon collection/analysis system specific to the CTBT international monitoring application and begin commercialization.

- Complete the assessment of deep water acoustic coverage including discrimination of natural events from evasively tested nuclear explosions and begin to facilitate the commercial development of a prototype hydroacoustic monitoring station.

- Complete the infrasound network detection estimates and determine false alarm rates; complete the simulation code for calculating the global propagation of infrasound signals; develop appropriate signal processing algorithms; begin transfer of prototype CTBT infrasound station to the U.S. National Data Center.

- Develop enhanced algorithms and display prototypes using integrated, multi-source and advanced processing techniques.

- Complete software utilities and procedures for automated data processing of events for the CTBT knowledge base.

- Transfer On-Site Inspection research results to agencies responsible for carrying out on-site inspection under a Comprehensive Test Ban Treaty.

- Initiate experiments to determine the value of organic signatures to nuclear proliferation detection and adapt integrated circuit technology to directly measure fissionable materials in field samples.

NONPROLIFERATION AND VERIFICATION RESEARCH AND DEVELOPMENT

REMOTE SENSING SYSTEMS

I. Mission Supporting Goals and Objectives

Develop and demonstrate sensors for space-based monitoring of nuclear explosions and for the early detection of clandestine nuclear weapons development. The Test Ban Treaty Verification Technology program designs, develops, produces, and provides operational system technical support for the nuclear explosion monitoring sensors needed to meet U.S. requirements for detection, identification, location, and characterization of nuclear explosions in the atmosphere and in space. The Proliferation Detection Technology Program conducts phenomena modeling, experimental sensor development, signature exploitation methodologies and satellite demonstrations for detection, identification, and characterization of nuclear production and processing activities.

The Test Ban Treaty Verification Technology program, which has from the beginning been a joint program with the U.S. Air Force, is one of the Department of Energy's longest-standing nonproliferation programs. The concept of satellite-borne nuclear explosion surveillance came about during interagency discussions from 1959 to 1962, leading to deployment of the original Vela explosion sensors. During the 36 years of this program, 101 satellite and space-probe payloads have been launched. The national need for worldwide cognizance of any nuclear explosions that might occur is now as important as ever in this time of high nuclear proliferation concern.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Remote Sensing Systems	$ 82,540	$ 77,424	$ 76,137	$ -1,287	-1.7
Total, Remote Sensing Systems	$ 82,540	$ 77,424	$ 76,137	$ -1,287	-1.7

III. Performance Summary:

FY 1995 Accomplishments:

- Provided continuous worldwide monitoring for atmospheric nuclear explosions by sensors designed, developed, and produced by the Nonproliferation and Verification Research and Development Program and deployed upon the Global Positioning System satellite constellation.
- Successfully operated the Department's first wholly designed, developed, and operated small satellite, an experiment/demonstration called the Array of Low Energy X-ray Imaging Sensors (ALEXIS), which is a test-bed for treaty verification technology.
- Produced and delivered two nuclear explosion detection sensor systems (each system consists of several individual sensors) to the Air Force for integration on Block IIR Global Positioning System (GPS) satellites.
- Provided support for the launch of a Defense Support Program (DSP) satellite carrying a DOE nuclear explosion detection system.

FY 1996 Accomplishments (to date and planned):

- Produce and deliver seven nuclear explosion detection sensor systems to the Air Force for the Block IIR Global Positioning System (GPS) satellite.
- Support the launch of Global Positioning System (GPS) satellites carrying DOE nuclear explosion detection systems.
- Launch the Fast On-orbit Recording of Transient Events (FORTE) small satellite to develop and demonstrate next generation techniques for detecting and characterizing the electromagnetic pulse from nuclear explosions in the atmosphere.
- Continue development of sensors and subsystems for integration on the Multispectral Thermal Imager (MTI) small satellite, which will demonstrate and evaluate multispectral and thermal imaging technologies for the passive, noncooperative detection and characterization of proliferant activities.
- Start design and development of a high-spectral resolution imaging spectroradiometer to detect the early stages of nuclear proliferation activities.

- Develop small satellite-based sensor package to detect near-space nuclear explosions.

FY 1997 Planned Accomplishments:

- Fabricate and deliver four Global Positioning System (GPS) satellite Block IIR nuclear explosion detection flight systems.
- Complete development of sensors and subsystems and start integration of the Multispectral Thermal Imager (MTI) small satellite to develop and demonstrate next generation techniques for characterizing, and monitoring nuclear production and processing activities.
- Design, fabricate and conduct laboratory and field tests of novel sensor designs and systems to provide improved capability to detect and characterize proliferation activities and to monitor nuclear treaties from remote distances.
- Start conceptual design of synthetic aperture radar for proliferation detection application on small satellites.

NONPROLIFERATION AND VERIFICATION RESEARCH AND DEVELOPMENT

ADVANCED SYSTEMS

I. Mission Supporting Goals and Objectives:

Develop and demonstrate laser-based remote chemical detection, multisensor systems research, and other innovative proliferation detection technologies. Laser-based remote detection will conduct research and development for detecting trace levels of airborne chemical effluents. Multisensor systems research will develop advanced computer processing methods for merging large amounts of data from multiple sensors to improve treaty verification and proliferation detection capabilities. Technology development will provide innovative state-of-the-art scientific and engineering methods to meet nonproliferation needs.

This program is instrumental in developing new ideas that reflect imagination and initiative, exploring technologies that could be useful in extending U.S. capabilities for proliferation detection and treaty verification. It is imperative for long-term national security that there continues to be a strong science and technology base focused on these purposes.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Advanced Systems	$ 49,687	$ 43,949	$ 35,449	$ -8,500	-19.3
Total, Advanced Systems	$ 49,687	$ 43,949	$ 35,449	$ -8,500	-19.3

III. Performance Summary:

FY 1995 Accomplishments:

- Continued development of improved lasers and standoff sensors for remote optical detection and characterization of multiple chemical effluents related to proliferation activities; successfully completed a major field test in July.
- Completed chemical signature study as suggested by JASON review; commenced active collaboration with Air Force Phillips Laboratory in development of CO_2 LIDARs, as directed by Congress.

- Completed field tests which demonstrated new capabilities in lidar remote chemical detection.
- Provided DOE developed LIDAR technology to the U.S. Army Edgewood Research and Development and Engineering Center (ERDEC) for use in ancillary programs for battlefield detection of chemical and biological weapons.
- Continued development of synthetic aperture radar (SAR) autofocus algorithms, sensitive change detection algorithms and interferometric SAR (IFSAR) terrain mapping algorithms for treaty verification purposes, and provided DoD with algorithms for their use in battle damage assessment and terrain elevation determinations.
- Measured and modeled light reflection and emission of complex objects, such as the variation with illumination and look angles in images taken in the visible to thermal infrared regions of the spectrum.
- Developed adaptive processing hardware (digital signal processing, neural network, and fuzzy logic VME boards) for efficient implementation of multi-thermal image pattern recognition algorithms, tested first generation elastic backscatter LIDAR feature extractor for plume recognition and tracking and initiated development of neural network technology to support a nuclear facility anomalous activity monitoring system.
- Transferred a significant number of high-risk, high-payoff projects directly to the user community in support of nonproliferation activities.

FY 1996 Accomplishments (to date and planned):

- Perform ground-based field tests of laser remote sensing systems to extend system performance beyond current state of the art, and continue signature work on excursions from baseline scenarios to broaden the performance envelope of remote chemical detection.
- Conduct a joint airborne LIDAR test with USAF Phillips Laboratory and the Edgewood Research Development and Engineering Center (ERDEC) to demonstrate lidar utility and to strengthen the collaboration between researchers and users in the remote chemical detection of proliferation activities.
- Design and deliver an integrated prototype system for cost effective implementation of complex change detection algorithms and adapt algorithms to other synthetic aperture radar (SAR) systems for dual use applications.
- Complete data collection and characterization of daytime phenomena influencing thermal signatures, and develop initial signal processing algorithms for infrared radiometric compensation; exploit spatial, spectral and observation angle variation properties of materials.
- Develop integrated software and electronic circuitry for specific applications to filter large volumes of spectral data to identify chemical signatures related to nonproliferation activities; build, along with industrial partners, an adaptive electronic processor for computer-assisted event or object recognition applications.

FY 1997 Planned Accomplishments:

- Continue joint LIDAR development program with USAF Phillips Laboratory and Army Edgewood Research Development, and Engineering Center.
- Conduct final ground tests for LIDAR systems for remote detection of chemicals at the Nevada Test Site, and begin follow-on airborne experimentsof advanced LIDAR systems.
- Continue development of complex phase history algorithms to enhance the information content of synthetic aperture radar (SAR) data in support of nonproliferation.
- Develop algorithms to extract higher quality information from infrared sensor data to extend capabilities for detecting proliferation activities.
- Continue to develop adaptive software and electronic circuits for smart computer-assisted sensor data analysis.
- Initiate new nonproliferation technology development projects which respond to other user agency requirements.

Explanation of funding changes from FY 1996 to FY 1997

- REDUCE CHEMICAL ANALYSIS BY LASER INTERROGATION OF PROLIFERATION EFFLUENT (CALIOPE) PROGRAM
  - o The exploitation of the recent breakthrough in detection and identification technologies will be limited to a smaller list of chemicals indicative of nuclear weapons programs.
  - o Airborne demonstrations and continued development will be limited to only the more mature/promising of the breakthrough technologies, eliminating development and/or demonstration of other significant proliferation detection capabilities.
  - o Cessation of R&D for one or more lidar techniques will adversely affect DOD programs leveraging from the DOE lidar investment.

NONPROLIFERATION AND VERIFICATION RESEARCH AND DEVELOPMENT

FACILITIES OPERATIONS

I. Mission Supporting Goals and Objectives:
Funding required to meet systems fabrication, technology research and development, high priority analytical needs, and Headquarters secure communications and classified information control requirements.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 13,500	$ 12,500	$ 12,164	$ -336	-2.7

ARMS CONTROL AND NONPROLIFERATION

PROGRAM MISSION

The Arms Control and Nonproliferation Program is the focal point within the Department for activities which support the President's arms control and nonproliferation policies, goals and objectives as well as statutorily-mandated activities. The major functional areas of the program include: Analytical Support; Nuclear Nonproliferation Policy; Reduced Enrichment Research and Test Reactor (RERTR); International Safeguards; Export Control Operations; Treaties and Agreements; International Security; and Materials Protection, Control, and Accounting (MPC&A). The program provides leadership and representation for the Department in the U.S. Government's interagency process, and for the U.S. Government in the national and international arms control and nonproliferation communities and organizations.

The GOAL of the Arms Control and Nonproliferation Program is to: reduce the threat of nuclear proliferation by integrating and orchestrating the Department's assets and efforts, including those of its national laboratories and contractors, in providing major policy and technical support to the U.S. Government's foreign policy and national security objectives in the areas of arms control and nonproliferation, and to the international arms control and nonproliferation communities.

The priority **OBJECTIVES** related to this goal are:

1. Secure Nuclear Materials and Expertise in Russia and the Newly Independent States.

2. Limit Weapon-Usable Fissile Materials.

3. Establish Transparent and Irreversible Nuclear Reductions.

4. Strengthen the Nuclear Nonproliferation Regime.

5. Control Nuclear Exports.

404

PROGRAM MISSION - ARMS CONTROL AND NONPROLIFERATION (Cont'd)

PERFORMANCE MEASURES:

1. Number of facilities at which Russia and Newly Independent States establish effective MPC&A programs over their nuclear weapons and materials increases.
2. Number of nuclear smuggling incidents decreases.
3. Number of nuclear weapon states remains constant or is reduced.
4. Number of Nuclear Nonproliferation Treaty (NPT) adherents increases.
5. Transparent and irreversible dismantlement of FSU nuclear warheads increases.
6. The number of inspections of fissile materials removed from nuclear weapons in Russia and the United States increases.
7. Successful negotiations of a Comprehensive Test Ban Treaty are completed.
8. Unilateral nuclear export controls are reduced and eventually replaced with multilateral controls.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Played a pivotal role in achieving an indefinite extension of the Nuclear Nonproliferation Treaty (NPT).
- Provided leadership for DOE and national laboratories' activities aimed at assisting Russia and other states of the Former Soviet Union in critical areas such as export controls, nuclear materials control and accounting, and physical protection.
- DOE's efforts to secure nuclear materials and expertise in Russia and the Newly Independent States have expanded rapidly since their beginning. From one site involving 75 kilograms of highly enriched uranium (HEU) in 1994, the program achieved materials protection, control and accounting (MPC&A) upgrades over 8 tons of plutonium and HEU at 26 facilities in 1995.
- Planned achievements during 1996 will involve hundreds of tons of materials at over 35 facilities. During FY 1997, the intense activity experienced during the past 24 months will continue as upgrades continue at the 17 facilities added during the past six months, and additional facilities are added under cooperation with the Russian Navy and other locations and activities in the former Soviet Union.

- Negotiated and implemented agreement to secure 500 kg of weapons useable highly enriched uranium (HEU) formerly located in Kazakstan.

406

ANALYTICAL SUPPORT

I. Mission Supporting Goals and Objectives

Analytical Support provides technical expertise and analytical support for arms control and nonproliferation treaty and agreement policy formulation, negotiation, and implementation at DOE facilities. Emphasis is on measures and verification options for a multilateral fissile material cutoff convention and bilateral cutoff with Russia, and development of monitoring provisions for the U.S. purchase of highly enriched uranium (HEU) from Russian nuclear weapons. Focus is also on implementing a reciprocal monitoring regime of U.S./Russian nuclear weapon dismantlement and fissile materials disposition, procedures for confirming stockpiles of removed materials, and alternative cost-effective dismantlement transparency and chain-of-custody measures. Assistance is provided with implementation of the U.S.-Russian agreement for exchange of technical information on nuclear warhead safety and security and supporting projects to employ FSU nuclear weapon scientists in non-weapon projects. Analytical support and technical expertise is also provided for the Nuclear Nonproliferation Treaty (NPT), negotiating a Comprehensive Test Ban Treaty (CTBT), and developing international nonproliferation inspection approaches.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Analytical Support	$ 15,666	$ 15,595	$ 13,684	$ -1,911	-12.3
Total, Analytical Support	$ 15,666	$ 15,595	$ 13,684	$ -1,911	-12.3

III. Performance Summary:

FY 1995 Accomplishments:

- Developed technical approaches for Russian plutonium (Pu) production reactor monitoring and storage.
- Developed reactor core conversion options to minimize Pu production at Russian Tomsk and Krasnoyarsk facilities.

- Characterized excess U.S. fissile material and developed procedures for International Atomic Energy Agency (IAEA) inspections at Oak Ridge, Hanford, and Rocky Flats.
- Prepared sensitive information disclosure risk assessment for Pu and highly enriched uranium (HEU) component inspections.
- Established radiation signatures and costs for warhead dismantlement at DOE facilities.
- Developed Pu parts measurement procedures and completed draft demonstration agreement with Russians.
- Completed warhead safety and security agreement with Russia.
- Provided policy analysis and technical expert support which enabled the achievement of an indefinite extension of the Nonproliferation Treaty (NPT).
- Provided technical support for Conference on Disarmament (CD) zero-yield Comprehensive Test Ban Treaty (CTBT) and Fissile Material Cutoff Treaty (FMCT) negotiations.
- Resolved National Ignition Facility (NIF) nonproliferation implications.
- Successfully transported 581 kilograms of weapons grade HEU from Kazakstan to the U.S. (Project Sapphire).
- Provided technical expert support negotiation of the Biological Weapons Convention (BWC) mandatory transparency measures.

410

FY 1996 Accomplishments (to date and planned):

- Continue analytical and technical support for FMCT negotiators.
- Conduct mock inspections at DOE facilities to assess costs and effectiveness of alternative FMCT transparency and CTBT on-site inspection provisions.
- Continue support for regular IAEA inspection of excess U.S. fissile material at DOE facilities.
- Complete compliance measures negotiations and develop measurement/surveillance techniques for Russian Pu reactor shutdown and Pu storage.

- Continue technical expert support and conclude negotiations for Russian HEU Purchase Agreement transparency measures.
- Conduct dismantlement technical exchanges and conclude Mutual Reciprocal Inspection (MRI) agreements with Russia on Pu and HEU.
- Enable completion of CTBT.
- Proceed with MRIs of U.S. and Russian dismantled weapon fissile material storage.
- Commence warhead safety and security exchanges with Russia.
- Develop methodology for DOE-wide evaluation of lab-to-lab programs effectiveness.
- Continue policy analysis and technical expert support for interagency policy makers and U.S. CTBT negotiators.
- Conclude Project Sapphire assistance package for Kazakstan.
- Assist with transport and disposition of other fissile material caches as required.
- Continue developing transparency measures for the BWC and prepare for implementation of agreed measures at susceptible DOE sites.

FY 1997 Planned Accomplishments:

- Complete FMCT negotiations, and commence FMCT implementation at DOE sites.
- Continue technical expert support for monitoring Russian plutonium production reactor and storage regime and activities related to the shutdown or conversion of the fuel in these reactors..
- Continue technical expert and policy analytical support for voluntary IAEA inspection of excess U.S. fissile material at DOE facilities. Conduct technical exchanges on classification issues.
- Continue technical support for Russian HEU purchase transparency agreement negotiations.
- Conclude Stockpile Data Exchange Agreement and begin negotiation of spot check measures to confirm the declarations.

- Continue warhead safety and security exchange projects.
- Validate methodology (metrics/measures) for evaluation of lab-to-lab activities with the Former Soviet Union and China.
- Conduct CTBT implementation and regional calibration exercises.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $1,911,000 reflects a shift in emphasis away from "traditional" cold war arms control activities towards regional nonproliferation and arms control initiatives now underway and described in the "Nuclear Nonproliferation Policy" program activity; and the result of the realignment of funds for program direction and related expenses to a new decision unit.

NUCLEAR NONPROLIFERATION POLICY

I. Mission Supporting Goals and Objectives

Nuclear Nonproliferation Policy funds technical support to Middle Eastern, South Asian, North Asian, and Latin American arms control and nonproliferation agreements, policies and negotiations. Funds support the State Department through increased contact with proliferant states to address the motives which drive proliferation, and the use of DOE resources to assist and conduct training in confidence building measures, arms control treaty verification, treaty implementation, cooperative monitoring, and the use of technology to facilitate proliferation prevention and roll back. In addition, funds support regional activities in support of global arms control treaties including the NPT, CTBT, and FMCT, and the study of nuclear fuel cycle and environmental issues which destabilize regions and threaten regional security.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Nuclear Nonproliferation Policy	$ 5,463	$ 5,282	$ 8,587	$ +3,305	+62.6
Total, Nuclear Nonproliferation Policy	$ 5,463	$ 5,282	$ 8,587	$ +3,305	+62.6

III. Performance Summary:

FY 1995 Accomplishments:

- Supported successful negotiations of US/European Atomic Energy Community (EURATOM) Agreement for Cooperation.
- Participated in negotiation and planning for new agreements for cooperation with Former Soviet Union (FSU) States, Switzerland, and China.
- Accomplished DOE statutory responsibilities for implementing Agreements for Cooperation including recommendations concerning requests for approval of subsequent arrangements.

- Planned Middle East verification technology demonstration and supported arms control talks for that region. Provided technology for the Korean peninsula denuclearization process. Supported East Asian security and arms control process. Supported South Asian confidence building.

- Hosted first visits of Pakistani and Indian delegations to discuss nonproliferation and arms control.

- Supported Cooperative Monitoring Center at Sandia National Laboratories which provides arms control and verification training to Middle Eastern and South Asian states.

FY 1996 Accomplishments (to date and planned):

- Develop, participate, and implement the President's directions to discourage the civil uses of plutonium and reduce plutonium and highly enriched uranium (HEU) stockpiles worldwide.

- Manage long-term alternatives for power and research reactor spent fuel disposition and support regional multinational fuel cycle initiatives.

- Implement Nuclear Nonproliferation Treaty and review activities. Support the Department of State in negotiations of new agreements for cooperation with FSU States, Switzerland, and China.

- Continue to accomplish DOE statutory responsibilities for implementing Agreements for Cooperation including recommendations concerning requests for approval of subsequent arrangements.

- Expand base program in cooperative verification and arms control training and agreements, and increase focus on energy security issues. Support verification technology demonstration in Middle East and South Asia and arms control activities in Korea and Northeast Asia.

- Increase focus on proliferation implications of nuclear fuel cycle decisions.

- Support development of regional centers for crisis prevention, arms control training, and treaty implementation.

- Support fissile material cut off treaty negotiations through site visits and bilateral discussions particularly with Israel, India and Pakistan.

FY 1997 Planned Accomplishments:

- Continue to accomplish DOE statutory responsibilities for implementing Agreements for Cooperation including recommendations concerning requests for approval of subsequent requirements.
- Send Department of Energy laboratory teams to implement nonproliferation verification experiments in the Middle East and South Asia to support regional arms control activities.
- Establish cooperative links with foreign laboratories to support regional arms control agreements in Israel, Egypt, India, Pakistan, and China.
- Conduct joint international experiments in support of fissile materials cut-off regime with India, Pakistan, and Israel.
- Assist, as appropriate, in implementation of agreed framework with North Korea and other regional arms control agreements in Asia. This is in addition to specific DOE responsibilities for implementing activities to arrest corrosion and safely can and store spent fuel as outlined in the International Security program activity.

Explanation of Funding Changes FY 1996 to FY 1997:

The net increase of $3,305,000 is due to the following: (1) an increase in analysis and support to U.S. nuclear arms control policies in the Middle East, Asia, and South Asia; (2) an increase in analysis and support to nuclear energy security issues in Asia, South Asia, and Europe; (3) an increase in support to U.S. policies that address excess civilian plutonium; (4) an increase in support for analysis, negotiation, verification, monitoring, and implementation of regional arms control agreements and nuclear weapons free zones; and (5) the realignment of funds for program direction and related expenses to a new decision unit.

REDUCED ENRICHMENT RESEARCH AND TEST REACTOR (RERTR)

I. Mission Supporting Goals and Objectives

Reduced Enrichment Research & Test Reactor (RERTR) Program supports development of low enriched uranium (LEU) fuels to further LEU conversion of research and test reactors; expedited return of U.S. origin research reactor spent fuel from overseas; and development of targets and chemical processes for producing molybdenum-99 using LEU. New funding will support development of advanced high density LEU fuels for Russian and Chinese reactors and remaining unconverted reactors in Western Europe and the U.S.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Reduced Enrichment Research & Test Reactor	$ 1,784	$ 3,447	$ 6,422	$ + 2,975	+86.3
Total, Reduced Enrichment Research & Test Reactor	$ 1,784	$ 3,447	$ 6,422	$ + 2,975	+86.3

III. Performance Summary:

FY 1995 Accomplishments:

- Led Reduced Enrichment Research and Test Reactor (RERTR) Program policy development activities with Russia, FSU or FSU-client countries, China, and South Africa.
- Began implementation of RERTR program with Russia, developing technologies needed to convert Russian-supplied research reactors to use LEU fuel.
- Completed technical feasibility study on the use of LEU fuel in the Advanced Neutron Source (ANS) reactor.
- Completed feasibility study on conversion of SAFARI I research reactor in South Africa to LEU fuel.

- Continued Low Enriched Uranium (LEU) fuel conversion assistance to Western research reactors. Continued cooperation in development of LEU targets for medical isotope production.
- Signed letter of intent with China to cooperate in Chinese RERTR program.
- Signed lab-to-lab contract with Russia to implement Russian RERTR program.
- Began preparation for development of advanced LEU fuels for use in high-flux research reactors which are currently unable to use qualified and licensed LEU fuel.
- Assisted in completion Environmental Impact Statement (EIS) to allow return of foreign research reactor spent fuel to the U.S.

FY 1996 Accomplishments (to date and planned):

- Continue cooperative activities with Russian laboratories on implementation of Russian agreements.
- Initiate return of U.S. origin spent nuclear research reactor fuel from abroad under the EIS.
- Conduct exchange visits with Chinese laboratories and start cooperative exchanges with China on RERTR.
- Begin U.S.-South African cooperation on production of molybdenum-99 using LEU.
- Initiate development of high density LEU fuels for research reactors.

FY 1997 Planned Accomplishments:

- Continue development of LEU fuels for Russia and begin studies of Russian reactor conversion.
- Continue development of LEU targets for molybdenum-99 production.
- Develop joint plan of reactor conversion with China.
- Continue development of high density LEU fuels for research reactors.

Explanation of Funding Changes FY 1996 to FY 1997:

The net increase of $2,975,000 is due to the following: (1) an increase for the full-scale initiation of advanced fuel development by the RERTR Program; (2) an increase for expanded international cooperation on reactor conversion efforts; (3) an increase that reflects the next step in the five-year fuel development program; and (4) the realignment of funds for program direction and related expenses to a new decision unit.

INTERNATIONAL SAFEGUARDS

I. Mission Supporting Goals and Objectives

International Safeguards funds efforts which strengthen the Nuclear Nonproliferation Regime. These efforts improve the effectiveness of the International Atomic Energy Agency (IAEA) safeguards and expand them to additional U.S. excess materials and sites. Technical support is provided to DOE sites for IAEA Safeguards implementation. New safeguards approaches and methods are developed for excess materials. Verification measures are developed for implementing a fissile material cut-off treaty. IAEA technical assistance programs which promote peaceful use of atomic energy are also supported as are bilateral nuclear cooperation efforts through "sister lab" arrangements. Cooperative agreements are negotiated and implemented for improved material protection, control, accountancy, and transparency with other countries, regions, and international organizations, including China, Japan, South Africa, South Korea, IAEA, European Atomic Energy Community (EURATOM), Argentine-Brazil Accounting and Control Commission (ABACC), and others. Funds also support environmental monitoring, remote monitoring, information management, and the International Nuclear Material Analysis Program (INA), for tracking and analyzing domestic and foreign nuclear materials.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
International Safeguards	$ 20,429	$ 19,679	$ 19,941	$ +262	+1.3
Total, International Safeguards	$ 20,429	$ 19,679	$ 19,941	$ +262	+1.3

III. Performance Summary:

FY 1995 Accomplishments:

- Initiated IAEA safeguards on excess highly enriched uranium (HEU) at Y-12, and excess plutonium at Hanford.
- Investigated new safeguards techniques for the IAEA to improve detection of undeclared activities (e.g., environmental monitoring).
- Provided policy analysis and technical expert support which enabled the achievement of an indefinite extension of the Nonproliferation Treaty (NPT).
- Conducted international safeguards cooperation with Japan, Argentina, Australia, Germany, and EURATOM.

- Demonstrated remote monitoring's nonproliferation application through field trials at the Russian Kurchatov Institute, Oak Ridge Y-12 plant, Vault 16, Argentina, fuel storage, and others.
- Supported IAEA inspections in Iraq and North Korea.
- Conducted international training courses on nuclear materials protection, controls, and accounting as required by the Nuclear Nonproliferation Act of 1978 (NNPA-78).
- Conducted modernization of U.S. nuclear materials tracking system (Nuclear Material Management and Safeguards System (NMMSS) into the new International Nuclear Analysis Program (INA).
- Entered safeguards agreement with Brazil and South Korea.
- Provided initial funding for DOE Material Protection, Control and Accounting (MPC&A) activities in countries of the Former Soviet Union in conjunction with funds provided by Nunn-Lugar legislation. Transferred to "MPC&A" program activity in FY 1996, where FY 1995 accomplishments supported by this funding are described.

FY 1996 Accomplishments (to date and planned):

- Initiate IAEA safeguards on excess plutonium at Rocky Flats.
- Implement IAEA safeguards on additional U.S. material and sites (e.g., Sapphire material, Portsmouth Gaseous Diffusion Plant).
- Develop new IAEA safeguards methods for excess nuclear materials in sensitive forms.
- Evaluate DOE action plan for international safeguarding of U.S. excess fissile material.
- Complete construction and initial operation of IAEA clean room laboratory in Vienna, Austria.
- Assist IAEA implementation of strengthened safeguards measures for routine use of enhanced technology (e.g., environmental sampling, remote monitoring, enhanced information management).
- Demonstrate remote monitoring at Y-12 excess nuclear material vault..
- Complete transition to new upgraded cost-effective INA program.
- Enter safeguards agreement with South Africa, China, Sweden, Finland, and Canada.

420

FY 1997 Planned Accomplishments:

- Provide analytical support and coordination to enable placement of additional quantities of excess material at U.S. DOE sites under IAEA safeguards.
- Develop verification measures for Fissile Material Cut-off Treaty.
- Promote peaceful uses of atomic energy.
- Enhance effectiveness of IAEA technical assistance programs through "sister lab" arrangements with 4 countries.
- Streamline U.S. nuclear material tracking system (INA) and perform data analyses to support U.S. policy.
- Add international agreements of cooperation with China, South Africa, and Sweden, to improve material protection, control, accounting, and transparency.
- Perform 3-4 country visits under U.S. Physical Protection Bilaterals Program.
- Provide international training courses on nuclear materials protection, control and accounting as required by NNPA-78.

421

Explanation of Funding Changes FY 1996 to FY 1997:

The net increase of $262,000 is due to the following: (1) a reduction in the International Nuclear Analysis (INA) program because of the successful completion of transition to the new system from the old Nuclear Materials Management and Safeguards System (NMMSS); (2) an increase in regional safeguards initiatives due to new international cooperation agreements to control nuclear material; (3) the placement of additional DOE facilities and nuclear material under IAEA safeguards; and (4) the realignment of funds for program direction and related expenses to a new decision unit.

ARMS CONTROL AND NONPROLIFERATION

EXPORT CONTROL OPERATIONS

I. Mission Supporting Goals and Objectives

Export Control Operations advance U.S. nonproliferation export control objectives by developing and implementing policies, regulations, and procedures to halt the spread of weapons of mass destruction; control the export of nuclear and nuclear-related equipment, materials, and technologies as mandated by law and in accordance with national security objectives; and provide unique technical expertise and training for the U.S. and international nonproliferation communities.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Export Control Operations	$ 15,757	$ 15,594	$ 15,302	$ -292	-1.9
Total, Export Control Operations	$ 15,757	$ 15,594	$ 15,302	$ -292	-1.9

III. Performance Summary:

FY 1995 Accomplishments:

- Reviewed and provided recommendations to the Department of Commerce on nuclear-related dual-use licenses, representing DOE on all interagency fora, e.g., the Advisory Committee on Export Policy and the Interagency Working Group on Nonproliferation and Export Controls.
- Administered for the Department, the controls on the transfer of technology and assistance under 10 CFR Part 810.
- Completed initiative within the Nuclear Suppliers Group to add technology controls for all items on the Trigger list.
- Completed the first technical review and revision of the Nuclear Suppliers Group's Nuclear-Related Dual-Use List.
- Initiated the first technical review of reactor, non-nuclear materials, and fuel fabrication technologies on the multilateral control lists since they were created in the 1970s.
- Conducted joint effort with U.S. Customs to train officials in the Baltic States and in Eastern Europe on the identification of nuclear and nuclear-related dual-use commodities and materials to assist in preventing the illicit trafficking of these items.

- Negotiated and began tasking through laboratory-to-laboratory arrangement with the Kurchatov Institute to assist host governments in establishing or enhancing effective export control systems.

- Published and disseminated throughout the DOE complex "Interim Guidelines on Export Control and Nonproliferation" to provide guidance on release of materials, equipment, and technology.

- Organized and presented nationwide series of regional workshops on "Export Control, Nonproliferation, and Property Management."

- Upgraded the Proliferation Information Network System (PINS) with enhanced security capabilities, and additional technology features, allowing more complete proliferation analysis and improving export licensing review.

- Initiated nonproliferation/export control outreach activities with Kazakstan and Ukraine.

- Organized pool of DOE laboratory technical experts to provide assistance to DOE field sites on identification and review of "high risk" property prior to sale or disposal.

FY 1996 Accomplishments (to date and planned):

- Review and provide recommendations to the Department of Commerce on nuclear-related dual-use licenses, representing DOE on all interagency fora, e.g., the Advisory Committee on Export Policy and the Interagency Working Group on Nonproliferation and Export Controls.

- Gain official Nuclear Suppliers Group adoption of the computerized information sharing system.

- Complete the technical review of technologies on Trigger Lists of the Nuclear Suppliers Group and the NPT Exporters Committee (Zangger) relating to reactors, non-nuclear materials, and fuel fabrication.

- Continue refinement and expansion of PINS to include more users within the Department of Energy community and possibly other agencies.

- Continue to assist in identifying illegal transfers of dual-use commodities through publication (in English and Russian) of a Nuclear Suppliers Group Customs Guide on sensitive goods.

- Develop and implement a two-year work plan to assist Newly Independent States and developing countries in implementation of effective export control systems.

- Increase FSU lab-to-lab arrangements with other institutes and other countries including the National Nuclear Center in Kazakstan and the Academy of Sciences (National Scientific Center-Institute for Nuclear Research) in Ukraine, to promote the role of technical exports in export license reviews.

- Hold a Peaceful Uses of Nuclear Energy Conference with the Republic of South Africa.
- Collaborate with DOE Central Training Academy to develop an institutional course on "Export Control, Nonproliferation, and Property Management."
- Continue administering for the Department, the controls on the transfer of technology and assistance under 10 CFR Part 810.
- Place two students in the FSU Graduate Student Facilitator Program in Russia and Kazakstan to assist the respective governments in implementing effective export controls.
- Enhance PINS license review computing and analysis environment and expand PINS data products capabilities.

FY 1997 Planned Accomplishments:

- Review and provide recommendations to the Department of Commerce on nuclear-related dual-use licenses, representing DOE on all interagency fora, e.g., the Advisory Committee on Export Policy and the Interagency Working Group on Nonproliferation and Export Controls.
- Continue to serve as the principal U.S. agency for identification of commodities that could be of significance for nuclear weapons purposes, and in the negotiation of multilateral controls on these items.
- Continue to serve as the administrator of all foreign transfers of nuclear technology and technical assistance under 10 CFR Part 810.
- Continue to serve as principal U.S. agency in support of the international nuclear export control regimes, especially the Nuclear Suppliers Group and the Nonproliferation Treaty Exporters Committee.
- Continue to provide orientation workshops on nonproliferation issues and topics for the U.S. Government.
- Integrate the export control case processing system with the distributed PINS client-server environment.
- Revise as appropriate and implement a two-year work plan to assist Newly Independent States and developing countries in the implementation of effective export control systems
- Maintain and enhance lab-to-lab cooperative agreements, providing assistance to enhance effective export control systems.
- Continue to sponsor bilateral and multilateral participation in Regional Conferences related to the Peaceful Use of Nuclear Energy.
- Increase FSU lab-to-lab arrangements with other FSU countries.

- Expand the FSU Graduate Facilitator Program through additional student placements.
- Expand the effort to assist implementation of effective export control systems to additional governments in regions of concern, consistent with U.S. nonproliferation objectives.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $292,000 is due to realignment of funds for program direction and related expenses to a new decision unit.

ARMS CONTROL AND NONPROLIFERATION

MATERIALS PROTECTION, CONTROL, AND ACCOUNTING

I. Mission Supporting Goals and Objectives

Materials Protection, Control, & Accounting (MPC&A) activities are designed to support cooperation under both the government-to-government and lab-to-lab agreements established with countries of the Former Soviet Union (FSU) for the protection of "direct use" nuclear materials. The program focuses on key facilities and institutions that possess and/or process significant quantities of such materials that are of concern to nonproliferation interests. The program provides expertise for the planning and implementation of systems and procedures to enhance protection of such materials. Included are development of computerized material control and accounting software systems and transfer of technology for radiation measurement methods, entry control, and elements of physical protection. These activities support the integration of nuclear materials security elements into systems that provide effective security and are maintainable by countries of the FSU. Efforts also promote the diffusion of nuclear materials security technologies, concepts, and expertise to different types of operating facilities where systems will be implemented.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Materials Protection, Control, & Accounting	$ 0	$ 45,815	$ 69,637	$ +23,822	+52.0
Total, Materials Protection, Control, & Accounting	$ 0	$ 45,815	$ 69,637	$ +23,822	+52.0

III. Performance Summary:

FY 1995 Accomplishments:

- Funding for these accomplishments is reflected in the "International Safeguards" program activity since the "Materials Protection, Control, and Accounting" program activity was not established until FY 1996.
- Upgrades at Kurchatov Institute: Completed site survey; developed and implemented plans for improved physical protection, including fencing, lighting, closed circuit television, sensors, access control systems, nuclear material and metal detectors, reliable power, and an improved MPC&A system.

- MPC&A demonstrations at Arzamas-16: Installed and demonstrated a model MPC&A system to be used at Arzamas-16 and other sites.

- Upgrades at IPPE Obninsk: Implemented a MPC&A system for the BFS facilities, including a comprehensive physical security system and extensive MPC&A systems and procedures.

- Upgrades at Elektorstal LEU line: Completed a site survey followed by MPC&A training; provided computers and software, seals and labels for MPC&A; furnished vulnerability assessment software, hand held detectors, and access control systems.

- Deployment of portal monitors and other MPC&A technologies at multiple facilities: Systems supplied to Obninsk include a radiation portal monitor and a digital image processing system for item control. Mayak received a demonstration of a number of portal monitors and MPC&A technologies. Elektrostal received hand held detectors. Kiev Institute of Nuclear Research received nuclear materials detectors and metal detectors.

- Completion of US/Russian Joint Action Plan: Prioritization of sites for surveys and MPC&A enhancements.

- Upgrades at Kiev Institute in Ukraine: Site survey followed by a plan for MPC&A upgrades and equipment specifications. Hand held detectors, seals, radiation detectors, a security radio system, an x-ray baggage screening system are to be delivered.

- Upgrades at the Ulba Metallurgical Plant in Kazakstan: Designed an enhanced physical protection system; provided NDA training; furnished seals and training in their use; supported development of an improved MPC&A system.

- DOE/GAN agreement signed: Implementation plan developed to support development of Russian regulatory base for MPC&A.

FY 1996 Accomplishments (to date and planned):

- Upgrades at Kurchatov Institute, Cheyabinsk-70, Tomsk-7, Arzamas-16, Obninsk IPPE, Mayak, Penza, Podolsk, Dimitrovgrad, Elektrostal HEU line, and other facilities in Russia. Plans, implementation, and training in the total spectrum of MPC&A systems and procedures.

- Upgrades at Aktau, Semey, and Almaty in Kazakstan; Kharkiv, Kiev, and Sevastopol in Ukraine; Sosny in Belarus, and institutes in Latvia, Lithuania, Uzbekistan, and Georgia.

- Provide equipment and training for GAN in support of development of the MPC&A regulatory base in Russia.

- Begin upgrades at facilities identified through GAN cooperation.

- Begin upgrades at new Minatom facilities identified at Gore-Chernomyrdin-6.

FY 1997 Planned Accomplishments:

- Continue to expand improvements at locations divided into five categories:
- Russia's Minatom civil nuclear sector (on the order of tens of tons);
- Minatom's nuclear weapon complex (on the order of hundreds of tons);
- Russian nuclear materials for use in civil applications but not controlled by Minatom (on the order of tons of materials);
- Nuclear materials in Russian naval propulsion applications (tens of tons of highly enriched uranium); and
- Nuclear materials outside of Russia (the goal is to have all work completed by the end of FY 1997 of significant quantities of weapon-usable materials in a fairly limited number of civilian facilities).
- Continue cooperation with Gosatomnadzor (GAN), the Russian nuclear regulatory authority in six areas:
- Instituting national level MPC&A standards.
- Establishing a national tracking system for nuclear materials.
- Providing equipment and training for inspectors.
- Upgrading MPC&A at independent facilities.
- Designing an MPC&A system.
- Exchanging of experiences and documents.
- Maintain the viability of the multiple path effort, continue development and deployment of technologies, continue expanding cooperation in all key sectors.

Explanation of Funding Changes FY 1996 to FY 1997:

The net increase of $23,822,000 is due to the following: (1) an increase that reflects the rapid pace of expansion of cooperation with Russian facilities in the upgrading of Materials Protection, Control and Accounting; and (2) the realignment of funds for program direction and related expenses to a new decision unit. This net increase is important to ensure early safeguarding of weapons usable material in support of U.S. nonproliferation goals. New facilities will be added to the program, including six new Minatom facilities and six new facilities identified by GAN.

TREATIES AND AGREEMENTS

I. Mission Supporting Goals and Objectives

The Treaties and Agreements program supports implementation of bilateral or multilateral, Presidentially-directed or Congressionally-mandated arms control and nonproliferation initiatives, agreements and treaties. In addition, it provides for unexpected, unbudgeted responses to arms control and nonproliferation requirements of an immediate nature based on urgent U.S. national security needs, as well as preparations to meet new transparency or verification requirements arising out of ongoing negotiations that are consistent with U.S. national security and without compromising proliferation sensitive information.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Treaties and Agreements	$ 12,643	$ 2,461	$ 4,028	$ +1,567	+ 63.7
Total, Treaties and Agreements	$ 12,643	$ 2,461	$ 4,028	$ +1,567	+ 63.7

III. Performance Summary:

FY 1995 Accomplishments:

- Accomplished the Project Sapphire mission of packaging, shipping, and purchasing highly enriched uranium (HEU) from the government of Kazakstan.
- Achieved a U.S./Russian plutonium shutdown agreement.
- Provided policy analysis and technical expert support which enabled the achievement of an indefinite extension of the Nuclear Nonproliferation Treaty (NPT).
- Provided U.S. voluntary offer for IAEA inspection of excess fissile material at the Oak Ridge Y-12 Plant.
- Conducted U.S./Russian reciprocal inspections of plutonium removed from nuclear weapons.

- Provided funds, technical support and personnel to "jump-start" laboratory-to-laboratory and government-to-government agreements and activities involving MPC&A support to Russian and The Newly Independent States (NIS), in advance of other, delayed funding sources.

- Provided technical support and personnel for United Nations Special Commission on Iraq (UNSCOM) to ensure no reinitiation of programs for weapons of mass destruction.

- Contributed to Gore/Chernomyrdin and O'Leary/Mikhailov initiatives.

- Funding includes reprogramming to support initiation of DOE activities to freeze North Korea's nuclear weapons program. Transferred to "International Security" program activity in FY 1996, where FY 1995 accomplishments supported by the reprogramming are reflected.

FY 1996 Accomplishments (to date and planned):

- Support the successful negotiation of a Comprehensive Test Ban Treaty (CTBT).

- Continue support for Gore/Chernomyrdin and O'Leary/Mikhailov initiatives.

- Coordinate purchase and secure HEU from governments of the former Soviet Union (FSU) and other nations, where appropriate.

- Coordinate establishment of policy of purchasing and securing plutonium from governments of the former Soviet Union (FSU) and other nations, where appropriate.

- Support extension of IAEA inspections of excess fissile to other DOE facilities.

- Continue and expand U.S./Russian mutual reciprocal inspections of excess fissile material.

- Coordinate and support the implementation of DOE responsibilities under Chemical Weapons Convention (CWC) and Biological Weapons Convention (BWC).

- Continue to provide technical support and personnel for United Nations Special Commission (UNSCOM) to ensure no reinitiation of programs for weapons of mass destruction.

- Provide contingency funding for unexpected requirements concerning treaty or agreement negotiations, implementation, and related activities responding to urgent U.S. national security requirements.

FY 1997 Planned Accomplishments:

- Support implementation of DOE responsibilities under a successfully-negotiated CTBT.
- Continue to coordinate purchase and secure HEU from governments of the former Soviet Union and other nations, where appropriate.
- Continue reciprocal inspections of excess fissile material in the U.S. and Russia.
- Continue technical support and personnel for UNSCOM efforts.
- Provide funding for treaty or agreement negotiations, implementation, and related activities responding to urgent U.S. national security requirements.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease in funding between FY 1995 and FY 1996 was due to Congressional elimination of DOE responsibilities under the Threshold Test Ban Treaty, which has been overtaken by events leading to negotiations underway to conclude a Comprehensive Test Ban Treaty. Events which unfolded in FY 1996 such as the dramatic increase in activities to secure weapons-usable nuclear materials in the Former Soviet Union, the purchase of hundreds of tons of HEU from Kazakstan and plans for downblending to LEU and accomplishing IAEA inspections, and activities to shut down the nuclear weapons programs of emerging rogue states or terrorists groups underscore the need for increased funding for FY 1997 to provide for immediate support to solve urgent national security problems. The net increase of $1,567,000 also reflects the realignment of funds for program direction and related expenses to a new decision unit.

INTERNATIONAL SECURITY

I. Mission Supporting Goals and Objectives:

The International Security program supports the implementation of security commitments made by the Administration regarding the Newly Independent States (NIS) of the Former Soviet Union (FSU) and the Democratic Peoples Republic of Korea (DPRK). Spent fuel activities in the DPRK include arresting the corrosion of the spent fuel from the 5MW research reactor in Nyongbyon, North Korea; and safely canning and storing spent fuel prior to its ultimate disposition in accordance with the "agreed" framework signed by the governments of the U.S. and DPRK. Other specific activities include the International Proliferation Prevention (IPP) Program in the NIS and FSU which is transferred from Defense Programs, Weapons Activities in FY 1996. The IPP Program is designed to reduce the global nuclear danger through focused proliferation prevention partnerships with science and engineering institutes in Russia, Ukraine, Kazakstan, and Belarus. Major initiatives include preventing "brain drain" by engaging scientists, engineers, and technicians in nonweapons-related projects; motivating participation in proliferation prevention activities; facilitating continued access to NIS facilities through technical engagement with personnel; and establishing self-sustaining commercial linkage that will support future independent commercial projects.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
International Security	$ 0	$ 13,211	$ 19,568	$ +6,357	+48.1
Total, International Security	$ 0	$ 13,211	$ 19,568	$ +6,357	+48.1

III. Performance Summary for Spent Fuel Activities:

FY 1995 Accomplishments:

- Reprogrammed funding for these accomplishments is reflected in the "Treaties and Agreements" program activity since the "International Security" program activity was not established until FY 1996.
- Reached agreement with DPRK regarding technical and logistical arrangements for safe storage of spent fuel from the 5MW research reactor at Nyongbyon, North Korea.
- Quickly deployed a chiller to arrest accelerated corrosion of the spent fuel.

- Began clarifying, de-ionizing, and treating the water in the fuel storage basin where the fuel has been residing.
- Began installing a complete system of equipment to place the spent fuel in sealed storage canisters.
- Began to place all the spent fuel from the 5MW research reactor, including damaged fuel in dry storage, into canisters filled with inert gas and under International Atomic Energy Agency (IAEA) seals.
- Reached agreement with DPRK regarding long-term operation and maintenance of the water treatment system.

FY 1996 Accomplishments (to date and planned):

- Complete work to arrest corrosion and treat water in the fuel storage basin.
- Complete placement of spent and damaged fuel into canisters with inert gas and under IAEA seals.
- Provide boiler to supply heat to the spent fuel building.
- Cover increased costs for water treatment and canning caused by delay in implementation, or by unforeseen technical or political problems.
- Cover any cost increases related to larger-than-anticipated amounts of radioactive cesium in the basin water.
- Fully characterize storage conditions and determine viability for long-term storage of North Korea spent nuclear fuel.
- Monitor spent fuel basin and fuel storage canisters during first year after canning.
- Revisit North Korea as required to assure that the water treatment system is operating correctly or address any technical problems or required maintenance of the water treatment or fuel storage systems.

FY 1997 Planned Accomplishments:

- Initiate a detailed study for disposition options for North Korean spent nuclear fuel.
- Revisit North Korea as required to assure that water treatment system is operating correctly or address any technical problems or required maintenance of the water treatment or fuel storage systems.
- Successfully respond to unforeseen technical or political problems that may disrupt successful completion of the spent fuel canning project or that may indicate a reinitiation of the DPRK's clandestine weapons program.

III. Performance Summary for IPP Program:

FY 1995 Accomplishments:

- Transferred from Defense Programs, Weapons Activities In FY 1996.

FY 1996 Accomplishments:

- Initiate 200 joint DOE laboratory-to-NIS institute research projects that support over 2,000 workyears of nonweapons work by NIS weapons technologists.
- Create 35 cost-share partnerships involving U.S. industry, DOE national laboratories, and NIS institutes which identify and commercialize NIS technology for the mutual economic benefit of the U.S. and the participating NIS country.
- Develop between 20-30 commercial products or processes which, if both technically and commercially feasible, will be patented, licensed, and transitioned to commercial manufacture in the U.S. and/or NIS.
- Provide management and business practices assistance, training, and exchanges with U.S. companies, universities, and DOE national laboratories for NIS weapons scientists, engineers, and technicians.
- Develop communication links with several key NIS weapons institutes to facilitate effective program management.
- Encourage investment by USIC member companies in commercial product development ventures with NIS institutes.

FY 1997 Accomplishments:

- Continue to engage NIS scientists, engineers and technicians in nonweapons-related projects.
- Increase proportion of cost-share partnerships for the mutual economic benefit of the U.S. and the participating NIS countries.
- Develop 20-30 commercially feasible products or processes for manufacture.
- Provide management and practices assistance, training, and exchanges.
- Promote improved interagency cooperation to leverage resources against U.S. Government strategic objectives.

- Maintain communication links with key NIS weapons institutes to perpetuate effective program management.
- Further refine/develop IPP multiagency information system.

Explanation of Funding Changes FY 1996 to FY 1997:

The net increase of $6,357,000 is due to the following: (1) an increase for DPRK follow-on activities including fuel characterization and system maintenance related to the canning of the North Korean spent nuclear fuel; (2)an increase for IPP activities that support additional DOE laboratory-to-NIS institute projects and new cost-share partnerships; and (3) the realignment of funds for program direction and related expenses to a new decision unit..

FACILITIES OPERATIONS

I. Mission Supporting Goals and Objectives:

Funding supports the establishment and maintenance of international safeguards and export controls; provides for U.S.-Russian lab-to-lab nuclear material protection, control, and accounting; and supports development of high density low enriched fuel.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 673	$ 23,973	$ 24,075	$ + 102	+ 0.4
Total, Facilities Operations	$ 673	$ 23,973	$ 24,075	$ + 102	+ 0.4

III. Performance Summary:

FY 1995 Accomplishments:

- Purchased equipment in support of International Safeguards activities including remote monitoring field trials, International Atomic Energy Agency (IAEA) environmental monitoring of field trials, modernization of U.S. nuclear materials tracking system, and implementation of international safeguards agreements.

- In support of Export Control Operations, purchased Proliferation Information Network System (PINS) secure telecommunications components and encryption equipment at selected PINS sites; purchased and installed PINS backup disk (RAID) subsystem; and purchased and installed PINS backup server.

FY 1996 Planned Accomplishments:

- In support of Export Control Operations, purchase Proliferation Information Network Systems (PINS) secure telecommunications components and encryption equipment for remaining PINS sites; purchase and install Windows NT Servers for key PINS local area networks; and purchase and install secure controlled interface system.

- Purchase equipment in support of International Safeguards activities including the Safeguards Information Management System (SIMS), remote monitoring project, IAEA environmental monitoring, and implementation of international safeguards agreements.

- Procure equipment in support of nuclear material protection, control, and accounting efforts with the Former Soviet Union (FSU).
- Purchase equipment for advanced fuel development efforts for the Reduced Enrichment Research and Test Reactor (RERTR).

FY 1997 Planned Accomplishments:

- Procure equipment in support of nuclear material protection, control, and accounting efforts in the Former Soviet Union.
- In support of Export Control Operations, purchase and install SQL database server; purchase and install backup secure telecommunications and encryption systems for PINS Wide Area Network(WAN) at each PINS site; and purchase and install PINS main server replacement.
- Purchase equipment in support of International Safeguards activities including environmental monitoring and analysis, remote monitoring, IAEA information management support to perform nuclear profiles, and implementation of international safeguards agreements.
- Purchase equipment for advanced fuel development efforts for the Reduced Enrichment Research and Test Reactor (RERTR).

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $102,000 reflects an increase in support of IAEA inspections of excess fissile material, to promote regional nonproliferation measures, and to increase the effectiveness and efficiency of IAEA safeguards.

INTELLIGENCE

PROGRAM MISSION

The Intelligence mission is to provide the Department, other U.S. Government policymakers, and the Intelligence Community with timely, accurate, high impact foreign intelligence analyses; to ensure that the Department's technical, analytical and research expertise is made available to the Intelligence Community in accordance with Executive Order 12333; to deter and neutralize foreign intelligence service actions (HUMINT) in the U.S. from acquiring sensitive information (classified and unclassified) involving DOE programs, facilities, technology, and personnel; to provide quick-turnaround, specialized technology applications and operational support to the intelligence, special operations, and law enforcement communities; and to provide threat assessment support to the Department's Headquarters and field operations.

The GOAL of the Intelligence Program is to support the National Security of the United States and have a direct impact on the policymaking process by providing actionable intelligence and/or technical support to intelligence operations that either reaffirms or amends existing policy, or initiates new policy actions. The Department's intelligence program serves four core policy areas: nuclear proliferation and weapons analysis, science and technology (S&T), energy security, and nuclear energy, safety and waste.

The OBJECTIVES related to this goal are to provide technical and analytical intelligence support to U.S. efforts to:

1. Improve nuclear materials protection, control, and accountability in the former Soviet Union;

2. Assist in the safe and secure dismantlement of former Soviet nuclear weapons;

3. Conclude Comprehensive Test Ban and Fissile Materials Cut-off treaties;

4. Verify foreign compliance with international treaties in the nuclear arena;

5. Limit and redirect North Korea's nuclear weapons program;

PROGRAM MISSION - INTELLIGENCE (Cont'd)

6. Address the challenge of global nuclear proliferation through the innovative and broad application of DOE assets;
7. Help identify low probability/high impact scenarios in our core areas;
8. Encourage and facilitate the application of DOE laboratory expertise to Intelligence Community technology development requirements;
9. Provide specialized technical support to operations in the intelligence, law enforcement, and special operations communities;
10. Assess threats to DOE personnel, operations and facilities from foreign and domestic adversaries; and
11. Assess the credibility of nuclear threats received worldwide and support efforts for the prevention of illicit nuclear materials trafficking.

PERFORMANCE OUTPUTS:

1. Provide 5,700 intelligence briefings for program and policy officials.
2. Publish 1,200 current intelligence products and studies.
3. Provide nuclear weapons-related training for 260 intelligence community personnel in support of U.S. Government nonproliferation initiatives.
4. Conduct 30 threat assessments.
5. Provide 60 counterintelligence awareness training sessions in support of counterespionage initiatives.
6. Complete 10 counterintelligence inquiries.
7. Conduct 80 counterintelligence travel briefings/debriefings.

PROGRAM MISSION - INTELLIGENCE (Cont'd)

8. Complete and transition 5-10 Special Technologies projects.

9. Adjudicate 500 cases for Sensitive Compartmented Information (SCI) access.

10. Process 320 requests for SCI clearances.

SIGNIFICANT FY 1995 ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- **Russian Nuclear Weapons Dismantlement** - Conducted debriefings, follow-on analysis, finished products and briefings of information relating to Russian nuclear weapon stockpile dismantlement.
- **North Korean Spent Fuel Handling and Safety** - Produced a paper that analyzed the current state and future prospects for the spent nuclear fuel removed from the North Korean reactor at Yongbyon.
- **FSU Radioactive Waste** - Produced the fifth volume in the series of reference papers on the disposition of radioactive wastes in the former Soviet Union (FSU).
- **China's R&D Program** - Produced a foundational study on Chinese R&D programs and priorities.
- **Japan's Energy Demand & Russia's Resources** - Completed a review of Japan's growing demand for secure energy supplies and the untapped energy resources of Russia's Far East.
- **CI Risk Assessments** - Conducted counterintelligence risk assessments to include the Department's vulnerability to economic espionage.
- **Irradiated Imports Assessment** - Assisted the U.S. Customs Service, in response to their request, with the evaluation of irradiated steel products received through the Port of Houston, Texas. They also used this opportunity to evaluate several radiation detectors for use by U.S. Customs Service inspectors.
- **Portable Gamma Detector** - Developed a prototype pager-sized gamma radiation detector, in direct response to Intelligence Community demands for a small, affordable detector. Prototypes being requested by numerous agencies across the U.S. government for initial field testing and examination.

PROGRAM MISSION - INTELLIGENCE (Cont'd)

- **Programmatic Threat Assessment Program** - Provided assessments of threats to DOE facilities and interests and collaborated with the FBI's National Center for the Analysis of Violent Crime for joint information and data sharing.
- **Technical Threat Awareness Training** - Provided training to Counterterrorism Community on national security activities involving weapons of mass destruction.
- **Communicated Threat Assessment Program** - Provided rapid credibility assessment of any threats made involving nuclear weapons, devices or materials, and supported rapid credibility assessment of potential nuclear weapons or materials smuggling activities.
- **Threat Awareness Seminars** - Conducted Treat Awareness Seminars for DOE, industry, law enforcement, and Intelligence Community.

2/ Program Direction Funding was transferred to the Program Direction Decision Unit; see the comparability matrices for FY 1995 and FY 1996 included in the Nonproliferation and National Security Executive Summary.

INTELLIGENCE

I. Mission Supporting Goals and Objectives

Provide analysis and reporting on: the status and direction of emerging nuclear weapons programs of proliferant nations; countries engaged in the supply of nuclear technology, equipment, and material to proliferant programs; the production and disposition of fissile material worldwide, with special emphasis on the implications of the breakup of the former Soviet Union and its impact on the control and accountability of special nuclear material in its possession; the foreign economic threat to U.S. energy resources and U.S. energy security; the impact of changes in global energy markets on U.S. industrial competitiveness, while emphasizing opportunities and challenges to U.S. exports; the identification of foreign nuclear facilities posing risk to health and the environment and implications of a massive release of radiation; foreign technology plans, priorities, and commercial applications of leading edge technologies deemed critical by the Department and the White House Office of S&T Policy; and foreign dual-use technologies in Russia and China. Operate a department-wide CI program which focuses on detecting and defeating intelligence threats from traditional and non-traditional adversaries directed against DOE. Assess threats to the Department's Headquarters and field operations. Assist intelligence, law enforcement and special operations communities in effectively tapping into DOE lab technology base, including by developing rapid turnaround specialized technology applications.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Intelligence Activities	$ 30,829	$ 30,057	$ 28,285	$ -1772	-6%
Total, Intelligence	$ 30,829	$ 30,057	$ 28,285	$ -1772	-6%

444

III. Performance Summary:

FY 1995 Accomplishments:

- **Nuclear-Related National Intelligence Products** - Participated in Nuclear Related National Intelligence Estimates.
- **Nuclear Facilities Database** - Completed the Energy Intelligence Information System (EIIS), a geographically based computer database system that contains detailed information on over 800 commercial nuclear facilities around the world.
- **Pakistan's Nuclear Program** - Produced a paper for DOE senior policymakers for use in negotiations.
- **Nuclear Reactor Safety** - Produced a compendium volume of the materials from open and classified sources aimed at identifying the most dangerous nuclear reactors worldwide.
- **Forecasting Foreign Technologies** - Sponsored a conference on foreign technology forecasting to support DOE policymakers and other U.S.Government officials.
- **Advanced Weapons R&D** - At the request of DOE policymakers and the Intelligence Community, assessed foreign weapons R&D capabilities.
- **High-Performance Computing** - Prepared an assessment of foreign high performance computing applications.
- **Energy Security the Next Century** - Sponsored a conference on Energy and National Security in the 21st Century exploring the new energy security dynamic confronting the U.S. over the next 10 to 15 years. Results are being used in Departmental strategic planning.
- **Russia's Oil Sector** - Examined Russia's oil production capability and prospects for technical and legal reform in the petroleum sector.
- **Radiation Detection Camera** - Completed proof-of-concept for an advanced radiation detection camera (radcom), which provides crucial real-time identifying information on potential radiation-emitting objects. The project transitioned to a multi-agency working group for further development.
- **Radiation Dispersal Verification** - Conducted a project to verify computer-simulated models of the aerosol dispersal of radiation-contaminated particulates. The results are key to planning and responding to nuclear emergencies.
- **Stand-off Explosives Detection** - Provided seed funding for expanded feasibility studies looking at the possibilities for stand-off explosive detection using millimeterwave holographic techniques.
- **Germanium Detector Cooling System** - Completed a prototype ultra-small cryogen cooling system for high-purity germanium detectors, eliminating the need for liquid nitrogen cooling and increasing the overall field portability of the instrument. This project has transitioned to DOE's Nuclear Emergency Response Team (NEST) for further development.

- **US-Canada Cooperation on Radiation Detection Technology** - Based on a bilateral agreement, supported collaborative technology development efforts to detect and deter illicit cross-border transit of nuclear materials and components.

FY 1996 and FY 1997 Accomplishments (to date and planned):

The FY 1996 and FY 1997 planned accomplishments will address the following issues:

- **Nuclear material control and accountability** - Analyses supporting U.S. Government policies in foreign material control and accountability.
- **Foreign nuclear weapons dismantlement** - Technical evaluations of foreign nuclear dismantlement programs.
- **Foreign nuclear material smuggling/surety of nuclear weapons** - Assessments of the flow and composition of nuclear smuggling focusing on the quality of smuggled material, the source of the material and the intended use of the smuggled material.
- **Nuclear nonproliferation training** - Provide training sessions for DOE and Intelligence Community analysts.
- **China's S&T plans, programs and priorities** - Multiyear look at China's potential as a technology developer/exporter and economic competitor to the U.S.
- **Expand the reactor risk program** - Assess unsafe foreign reactors near US facilities.
- **Expand the Energy Intelligence Information System (EIIS)** - Include additional information about radioactive waste disposal practices around the world. EIIS is currently limited to the Intelligence Community; however, this version will be of use to U.S. government entities abroad and will provide valuable information on facilities in the event of an accident or other nuclear related events.
- **Energy disruptions and emergencies** - Respond to customer requested technical assessments of foreign energy disruptions.
- **Radiation detectors for US Customs** - Conclude a project with US Customs to test and evaluate current and emerging technologies in order to identify the most appropriate detectors for use by Customs inspectors.
- **Special Projects Facility** - Establish a special projects facility at Idaho National Engineering Laboratory (INEL) to support projects related to biotechnology, materials science and engineering, chemical sciences research, digital signals processing and electronic systems, and to provide special training support.

Nuclear Terms Handbook - Published Nuclear Terms Handbook to strengthen the capabilities of National Security Community through improved understanding of the terminology associated with nuclear weapons and devices.

INTELLIGENCE

FACILITIES OPERATIONS

I. Mission Supporting Goals and Objectives:

Supports enhancement of infrastructure and core capabilities at Special Technologies Program (STP) laboratories to meet programmatic needs.

Supports enhancement of the Communicated Threat Assessment Program equipment modification.

II. Funding Schedule: N/A

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 900	$ 900	$ 900	$ 0	$ 0
Total, Facilities Operations	$ 900	$ 900	$ 900	$ 0	$ 0

III. Performance Summary:

FY 1995 Accomplishments:

- Developed a microwave material investigation radar system that can be used as a test platform to evaluate the usefulness of this technology in broader applications, such as law enforcement, nonproliferation, NEST access, and inspection and evaluation of civil structures.

- Developed fly-away health physics kits for Technical Analysis Group (TAG) deployments to perform initial analysis of suspect nuclear materials.

- Enhanced capabilities of equipment necessary to support the Communicated Threat Assessment Program.
- Obtained a solids modelling system (computer-aided design) and a laser interferometer to support specific project activities and enhance overall laboratory capabilities.

FY 1996 Accomplishments (to date and planned):

- Obtain deferential scanning calorimeter, millimeter wave reflectometer, and scaled test chamber to support specific project activities.
- Obtain other equipment as needed to support project activities and enhance overall laboratory capabilities.
- Obtain equipment as necessary to support Communicated Threat Assessment Program enhancement.

FY 1997 Planned Accomplishments:

- Obtain equipment as needed to support specific project activities and enhance overall laboratory capabilities.
- Obtain equipment as necessary to support Communicated Threat Assessment Program enhancement.

Explanation of Funding Changes FY 1996 to FY 1997: N/A

NUCLEAR SAFEGUARDS AND SECURITY

PROGRAM MISSION

The Nuclear Safeguards and Security Program provides effective policy, programmatic direction and training for the protection of the Department of Energy's (DOE) nuclear weapons, nuclear materials, classified information, and facilities. The program provides technology development and technical support to domestic safeguards and security activities as well as implementation of effective classified information and information control policies.

The GOAL of the Nuclear Safeguards and Security Program is to:

Support the National Security of the United States by assuring the effective, cost-efficient protection of the DOE's nuclear weapons, nuclear materials, and facilities against theft, sabotage, espionage, and terrorist activity.

The OBJECTIVES related to this goal are:

1. Strengthen support to field elements to facilitate implementation of cost-saving safeguards and security measures.

2. Develop Department-wide strategic and long-range planning for domestic nuclear safeguards and security.

3. Initiate modernization effort of safeguards and security management information systems.

4. Provide a domestic technology and systems development base program to ensure technical capabilities and procedures are available to sustain the protection of sensitive DOE facilities, special nuclear materials, and classified matter.

5. Ensure availability of state-of-the-art technical capabilities for accountability and control of nuclear material recovered from disassembled nuclear weapons returned from the stockpile, and storage of special nuclear materials.

6. Strengthen the role of the Safeguards and Security Central Training Academy.

PROGRAM MISSION - NUCLEAR SAFEGUARDS AND SECURITY (Cont'd)

7. Develop programs to support the standardization and accreditation of physical security systems.

PERFORMANCE MEASURES:

1. Central Training Academy will conduct 124 courses with approximately 180 iterations.

2. The Technology and Systems Development activities will address 47% of the backlog of documented and validated field user needs by modifying current technologies for safeguards and security applications or developing new technologies to specifically address safeguards and security deficiencies

3. Comply with Executive order on Classified National Security Information by issuing new procedures, training those individuals responsible for implementing these procedures, and initiating the declassification of 15 percent of DOE's National Security Information records which are permanently historical and over 25 years old by October, 1996, while continuing to protect that information which warrants classification.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Comprehensive continuous review and analysis of program requirements coupled with advances in safeguards and security technologies has resulted in millions of dollars in savings and cost avoidance for the Department.

- The Safeguards and Security program has been and will be the key deterrent in preventing major incidents (i.e., theft, sabotage, terrorist activity, etc.) across the complex at 16 domestic weapons sites.

- The Declassification program has played a key role in implementing the Department's Openness Initiative by maximizing public access to Departmental information while protecting our national security posture, thus rebuilding the public's trust in the Department of Energy.

Nuclear Safeguards and Security
Program Funding Profile
(Dollars in Thousands)

Subprogram	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Adjusted	FY 1997 Budget Request
Safeguards and Security

a/ Reflects reduction of $35,000 for travel rescission, $600,000 internal reprogramming increase in support of NMMSS, and a $3,000,000 reprogramming increase for the Declassification Productivity Initiative.

b/ Use of prior year balances – Reprogramming 95-R-6 which reimbursed Security Evaluations for a review commissioned by the Under Secretary.

c/ Reflects reprogramming increase of $1,000,000 for implementation of Executive Order 12958 on Classified National Security Information.

d/ Pending reprogramming increase of $3,000,000 for the Declassification Productivity Initiative.

SAFEGUARDS AND SECURITY OPERATIONAL SUPPORT
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

Safeguards and Security Operational Support provides the essential technical and analytical expertise to ensure effective and efficient security; protective force for Headquarters operations; reviews which ensure cost-saving measures in safeguards and security throughout the Department; standardized training responsive to the challenges of the changing post-cold war era; and office automation modernization geared to a more responsive and efficient operation. This support provides for the overall improvement of safeguards and security activities.

Subprogram activities in this section of the budget include the following:

- Nuclear Materials Management and Safeguards System (NMMSS), the national data base and information support system for nuclear materials under the safeguards controls and special accounting procedures of the United States Government, was replaced by the International Nuclear Analysis program. This program is now included in the Arms Control and Nonproliferation budget under International Safeguards.

- Central Training Academy (CTA) is the Center of Excellence for safeguards and security training and training development. CTA uses both traditional and distance learning technologies to provide onsite and facility training for safeguards and security personnel ensuring that DOE maintains a well-trained workforce to protect the nation's vital nuclear and energy interests against espionage, sabotage or theft. CTA assesses safeguards and security field training needs and site training program performance and develops training courses to meet those needs. Distance Learning Training includes satellite transmission of CTA training to multiple DOE sites and, through the use of modern interactive technology, allows each student to be part of the instructional process. Computer-based training, interactive audio/video training and correspondence courses are also provided.

- Information Security provides support in the areas of classified matter protection and control, technical security, information systems security, operation security,and foreign ownership, control or influence. Technical Surveillance Countermeasures (TSCM) ensures and enhances the security provided for DOE facilities in the greater Washington, D,.C. area. The Information Security Resource Center (ISRC) incorporates technical expertise and professional development of training and issues related to information security, it provides information security research and development capability, specialized training as needed, and coordinates each information security discipline into an integrated, cohesive single program.

- Security Education Briefing and Awareness provides support for Security Education Briefing and Awareness to reflect changing policies and procedures. Coordinates and participates in security education workshops and meetings for the exchange of resources and dissemination of security education information and assist contractors in establishing supporting briefing materials.

I. **Mission Supporting Goals and Objectives - SAFEGUARDS AND SECURITY OPERATIONAL SUPPORT** (Cont'd)

- o Headquarters Guard Contract provides security, including upgrades in quality of service, for the protection of Government property, classified matter, and personnel at headquarters buildings.

- o Personnel Security evaluates, reviews, and develops guidance and documents for use in evaluating the Personnel Security Assurance Program (PSAP) as it relates to medical, psychological, legal, security, and management components. Researches and prepares technical documents to support the Accelerated Access Authorization Program (AAAP). Provides technical assistance and operational support to the AAAP program manager to determine current status of science and technology in the AAAP component areas.

- o Additional Support provides Headquarters and field elements with support to implement cost-saving safeguards and security measures. Support includes technical assessments, vulnerability assessment support, technical and engineering assistance, surveys, performance testing, technical background on policy issues, arms control support, administrative and technical guidance in the development of computer security policy for classified systems, and the security alarm system at Headquarters. The Safeguards and Security Information Management System (SSIMS) tracks and reports classified safeguards and security issues from all DOE field sites.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Nuclear Materials Management and Safeguards System (NMMSS)	1,600	0	0	0	0
Central Training Academy (CTA)	8,867	8,736	8,400	(336)	(4%)
Information Security	1,152	1,152	1,152	0	0
Security Education Briefing and Awareness	181	181	181	0	0
Headquarters Guard Contract	10,029	8,629	8,500	(129)	(1%)
Personnel Security	705	485	485	0	0
Additional Support	3,073	3,348	3,153	(195)	(6%)
Total, Safeguards and Security Operational Support	$ 25,607	$ 22,531	$ 21,871	$ (660)	(3%)

III. Performance Summary:

FY 1995 Accomplishments:

NUCLEAR MATERIALS MANAGEMENT AND SAFEGUARDS SYSTEM

- Completed parallel processing by the Nuclear Materials Management and Safeguards System (NMMSS) and the International Nuclear Analysis program.

CENTRAL TRAINING ACADEMY

- The Central Training Academy conducted 112 courses with 176 classroom iterations.

INFORMATION SECURITY

- Provided security to sensitive DOE Headquarters facilities in greater Washington, DC, area through the Technical Surveillance Countermeasures (TSCM) program, ensuring protection from hostile intelligence or industrial espionage.

- Operated Information Security Resource Center (ISRC) providing TSCM and OPSEC workshops and 11 information security classes.

SECURITY EDUCATION BRIEFING AND AWARENESS

- Upgraded security education materials to reflect changes in security requirements

HEADQUARTERS GUARD CONTRACT

- Completed and submitted for approval a Headquarters Protective Forces Training Approval Plan.

- Provided security manpower for two additional buildings in Germantown in response to the Oklahoma City bombing incident.

- A new Headquarters protective force was selected.

PERSONNEL SECURITY

- Operated the Center for Human Reliability Studies providing support for the Personnel Security Assurance Program (PSAP) through guidance and product development; and research, development, and technical expertise in the areas of psychological assessment, substance abuse testing, medical assessment, and legal issues.

ADDITIONAL SUPPORT

- Performed line item construction project reviews in the DOE complex resulting in potential outlay program cost savings of $30 million.

- Assisted field elements in treaty inspection activities/preparation, conducted vulnerability assessment and training, safeguards and security surveys, and technical assessments; streamlined the Site Safeguards and Security (SSSP) process, assisting five field offices in the development and acceptance testing of SSSPs; and the Training Approval Program reviewed, validated, and approved site-specific training programs for all safeguards and security topical areas.

- Provided onsite support before, during, and after a protective force strike at Rocky Flats, and potential strikes at the Idaho Operations Office and the Mound Facility, to ensure appropriate security.

- Initiated training in support of new Headquarters protective force radio system and initiated functional and operational requirements for integrating the Headquarters badging system and access control systems with the DOE Integrated Security System (DISS).

- Provided support to the Safeguards and Security Information Management System (SSIMS) which tracks and reports classified safeguards and security issues DOE wide.

FY 1996 Accomplishments (to date and planned):

CENTRAL TRAINING ACADEMY

- The Central Training Academy will conduct 115 courses with 180 classroom iterations with emphasis on "On-line Training."

INFORMATION SECURITY

- Through operation of ISRC, revise all information security system courses to integrate new restricted data security program; and conduct TSCM and OPSEC workshops and information security classes.

SECURITY EDUCATION BRIEFING AND AWARENESS

- Upgrade security education requirements by implementing changes specified in the National Industrial Security Plan (NISP) of January 1995 and Executive Order 12958 of April 1995.

HEADQUARTERS GUARD CONTRACT

- First full year of operation of new protective force contract.

- Implement a Supervisor Certification Program to improve the quality of protective force supervision, and an Award Fee Process designed to improve protective force performance.

457

PERSONNEL SECURITY

- Expand the PSAP telecommunications network through the electronic bulletin board system that will be made available to DOE and DOE contractor personnel.

ADDITIONAL SUPPORT

- Perform line item construction project reviews and technical assessments, ensuring continued resource optimization in the DOE complex; assist field sites in treaty inspection/vulnerability assessments; and streamline the SSSP process.

- Complete enhancements to Germantown security area access control system and the Headquarters alarm system; complete training in support of the new Headquarters protective force radio system; and continue integrating Headquarters badging system and access control systems with the DISS.

- Maintain support for SSIMS activities.

FY 1997 Planned Accomplishments:

CENTRAL TRAINING ACADEMY

- The Central Training Academy will conduct 124 course offerings with 180 classroom iterations. Provide training for a community of approximately 6,000 protective force members to ensure adequate protection of nuclear materials, classified information, and nuclear facilities.

- Provide training for safeguards and security professionals involved in highly technical and sophisticated programs dedicated to protection of national security interests.

INFORMATION SECURITY

- Maintain operation of ISRC, converting information security courses to distance learning activities.

SECURITY EDUCATION BRIEFING AND AWARENESS

- Through education programs, provide security awareness throughout the DOE complex.

HEADQUARTERS GUARD CONTRACT

- Ensure that a sound protection program is offered to Headquarters employees and facilities.

PERSONNEL SECURITY

- Maintain operation of the Center for Human Reliability Studies by providing support for the PSAP through guidance and product development; expert technical advice and assistance; updating and revising of PSAP materials; and as technical liaison with Department of Defense Personnel Security Research Center (PERSEREC), Department of Defense Security Institute, Department of Polygraph Institute, and other similar agencies and institutions.

ADDITIONAL SUPPORT

- Perform line item construction reviews and technical assessments, ensuring continued resource optimization in the DOE complex; assist field sites in treaty inspection/vulnerability assessments; streamline the SSSP process; and provide other technical assistance and engineering assistance to field sites in the implementation of safeguards and security measures.

- Provide enhancements and modifications to Headquarters alarm system; integrate the Headquarters badging system and access control system with other Headquarters personnel data bases; and maintain the Headquarters protective force radio system at a 98% operational level.

- Maintain support for SSIMS activities.

Explanation of Funding Changes FY 1996 to FY 1997:

A total decrease of $660,000 from FY 1996 to FY 1997 results from: a $336,000 reduction to the Central Training Academy, a $129,000 reduction to the Headquarters Protective Force contract to align it with expected contract cost, and a $195,000 reduction to Additional Support applied to access control activities.

TECHNOLOGY AND SYSTEMS DEVELOPMENT
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

The Technology and Systems Development program's mission is to develop new or modify existing technologies to protect DOE facilities, nuclear materials and classified information from existing and evolving threats such as insiders and terrorists. The program is formulated to address documented user requirements within the DOE complex and to meet Headquarters policy needs. The program will be able to address approximately 47% of these documented user needs.

The Technology and Systems Development program is divided into the following subprograms:

- Science and Technology Development Projects includes all activities ranging from basic research to full scale development and technology transfer of a technology or system that will address a safeguards and security deficiency.

- Technology Application and Transfer Projects includes activities necessary to modify a proven technology for safeguards and security applications.

- Technology Support, Assistance, and Consultation Tasks includes technical training, technical support to Headquarters, technical workshops and seminars, and technical support and assistance to the DOE complex.

Each subprogram is concentrated in the following disciplines:

- Physical Security: Activities are focused in detection; access control; control and display; assessment; barrier/delay; and personnel subsystems.

- Material Control and Accounting: Efforts are focused in nuclear material measurements; material accounting; material control; training; and statistical methods.

- Information Security: Projects are focused on advice and assessment; education and awareness; incident response; tools and technology; and integration and assurance.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Science and Technology Development Projects	$ 17,583	$ 16,523	$ 16,543	$ 20	0%
Technology Application and Transfer Projects	450	1,072	820	(252)	(24%)
Technology Support, Assistance and Consultation	2,122	3,310	3,270	(40)	(1%)
Total, Technology and Systems Development	$ 20,155	$ 20,905	$ 20,633	$ (272)	(1%)
Crosswalk of Disciplines					
Physical Security	$ 7,404	$ 7,738	$ 7,681	$ (57)	(1%)
Material Control and Accountability	9,877	10,114	9,782	(332)	(3%)
Information Security	2,874	3,053	3,170	117	4%
Total	$ 20,155	$ 20,905	$ 20,633	$ (272)	(1%)

III. Performance Summary:

FY 1995 Accomplishments:

PHYSICAL SECURITY ($7,404)

- Developed a wireless and secure video transmission capability to provide enhanced detection capabilities at DOE sites at reduced lifecycle costs.
- Developed a polled tag technology for remotely monitoring nuclear materials in a manner that is resistant to insider tampering. This system will provide increased confidence that no materials have been stolen or diverted without the need for physical checks, thus reducing costs and personnel radiation exposure.
- Designed the badge and ancillary equipment necessary to provide a standard badging system for use throughout the DOE complex.

- Completed testing standards for passive infrared (PIR), microwave, ported coax, exterior infrared (IR), and metal detectors. These standardized testing procedures will be used throughout the DOE complex to ensure there are no vulnerabilities with new equipment being installed.

- Initiated a national security product certification program to standardize the performance requirements of security equipment that can be procured for use within the DOE complex

- Modified existing software code capable of identifying sabotage vulnerabilities to meet DOE radiological protection requirements, and developed a Sabotage Target Identification and Vulnerability Course

- Completed functional requirements document for currently existing and future alarm annunciation and entry control systems so that DOE sites can make informed procurement decisions in this highly technical and confusing area.

- Published the DOE physical protection guide to provide the DOE community and other federal agencies with the latest technologies/methodologies in intrusion detection and assessment systems.

- Developed concepts for using technology to eliminate requirements for two door portals at DOE sites to reduce costs while maintaining adequate security.

- Vulnerability assessment of hand geometry units which are used to protect sensitive facilities throughout DOE.

- Developed a prototype nonautonomous exterior sensor tester to reduce personnel involvement in sensor testing throughout the DOE complex, thus resulting in reduced operating costs and personnel radiation exposure.

- Developed fixtures that test physical security sensors without human stimulus thus preventing human exposure to harmful environments.

- Developed a prototype system for automated property protection to prevent the theft of high-cost government property.

MATERIAL CONTROL AND ACCOUNTING ($9,877)

- Completed second generation continuous automated vault inventory system for remotely monitoring nuclear materials in a vault. This system confirms the presence of nuclear materials in storage and extend the time between physical inventories, reducing costs and personnel radiation exposure.

- Completed Xenon gas handling system to be used as an unattended room-temperature nuclear material monitor to confirm the presence of nuclear materials.

- Completed test and evaluation of computer controlled calorimeter to measure nuclear material. This system will reduce radiation exposure by reducing human interaction.

- Completed fabrication of high wattage Mound electrical calibration heater probe which can be used to calibrate calorimeters without using nuclear materials.

- Began building prototype Access by Controlled Remote Sensing system which will be used by international inspectors to inspect departmental facilities through video cameras, monitors, and sensors, not by actual physical interaction.

- Added the isotopic analysis capability to the segmented gamma scanning (SGS) technique to measure the isotopic distribution of plutonium. This allows the characterization of additional isotopes that are not easily measured with the SGS because of the unavailability of standards and provides more accurate accountability of special nuclear materials.

- Delivered a software package that allows active neutron measurements of highly enriched uranium to provide a more accurate and rapid measurement capability.

- Transferred the miniature modular multichannel analyzer technology to private industry to provide a commercial source of instruments to measure holdup.

- Finalized the American Society for Testing and Materials (ASTM) standard test method on californium shuffler assay of waste.

- Completed the windows tomographic gamma scanner software that will provide more rapid and accurate measurements of waste drums.

INFORMATION SECURITY ($2,874)

- Developed a methodology for analyzing what needs to be logged (for information system auditing purposes) based upon the stated DOE site security policy.

- Designed an information systems security server to be used by the entire departmental computer security community to disseminate security tools, patches, policy, and related information.

- Fielded the first real-time version of the network intrusion detection software across the DOE complex. This software will be used to identify hacker, or other types of system break-in signatures.

- Formalized a collection and reporting system for communication of computer operating system and network vulnerabilities. Established procedures for exchange of this sensitive information within DOE, and with other federal incident response teams.

- Field tested Binary Authentication Tools to be used to verify the origin, version, and resulting security of software to be used throughout DOE.

- Expect to complete and field a network based security profile inspection tool for distributed mode inspections of DOE information systems.

- Developed second generation document text analyzer to be used as an automated classification reviewing tool. Created graphical user interface and multiple phrase analysis capability.

- Forewarned of SATAN network security analyzer release. Following release, developed a scan detector to alert network administrators when SATAN was being used to probe their information systems for attack vulnerabilities.

- Developed technology for conducting electronic open meetings in support of National Performance Review re-inventing government initiatives. Evaluated those technologies for security related issues and vulnerabilities.

- Increased performance of network mapping software tool from 254 hosts/1380 seconds to 254 hosts/approximately 3 seconds. Tool is used to detect unauthorized hosts on classified and unclassified computer networks.

- Accredited first Department of Energy multilevel network which allows users with various access levels to share the same information system, thus reducing hardware and software costs.

- Completed classified electronic document management system. More than fifty systems are currently in use throughout DOE.

- Demonstrated basic components of a prototype multilevel document management center.

- Constructed and used testbed network for evaluating new multilevel information system products.

- Developed automated information system tool to detect waste, fraud, and abuse of computer systems.

- Developed and conducted computer security awareness and training courses.

FY 1996 Accomplishments (to date and planned):

PHYSICAL SECURITY ($7,738)

- Create the ability to vary physical security system designs without having to rerun the ASSESS code every time a change is made. This will allow the user to clearly screen design options from the perspective of cost.

- Develop additional sensors for remotely monitoring special nuclear material in vaults to reduce human and radiation exposure.

MATERIAL CONTROL AND ACCOUNTING ($10,114)

- Complete an automated non-destructive assay system for weapons component dismantlement. This automated system will reduce human radiation exposure and the threat of nuclear material theft or diversion.

- Complete a local area network materials accounting system (LANMAS) that will provide the DOE complex with a standardized materials accounting system.

- Complete upgrade of a high-efficiency neutron counter to improve measurement control for neutron non-destructive assay measurements.

- Implement uranium position correction techniques in waste drum shufflers to improve measurement accuracy.

- Complete implementation of a software code at Savannah River Site and additional sites implementing LANMAS. This code performs automated analysis of material accounting data to determine if measurements are within proper control limits, thus reducing the threat of diversion or theft.

- Test and evaluate the prototype segmented add-a-source system in conjunction with a commercial vendor under a cooperative research and development agreement (CRADA). This system will provide the ability to measure the plutonium content in waste drums and other bulk containers.

- Finalize the American Society for Testing and Materials (ASTM) standard test method Nondestructive Assay of Nuclear Material in Waste By Combined and Active Prompt Neutron Counting.

- Complete testing of the final gamma-ray software on the actual segmented gamma scanner that will be used for unmeasured inventory, thus improving nuclear material accountability.

- Complete testing of the final neutron software on the modified shuffler that will be used for unmeasured inventory resulting in improved nuclear material accountability.

- Complete customized miniature modular multichannel analyzer package for unattended operations and thus provide automated, real-time quantitative monitoring of nuclear materials.

- Publish an updated vehicle monitor applications guide which will assist DOE with the specification, evaluation, calibration, and proper use of this technology.

- Complete delivery of an end-user acoustic resonance intrinsic seal system which will confirm the presence of nuclear materials in storage.

- Transfer an image processing-based surveillance system that is used to confirm the presence of nuclear materials in storage, to private industry. This system can be used to prolong the frequency of physical inventories, thus reducing operational costs and personnel radiation exposure.

- Install the target monitoring and alarm system at a DOE site. This system will provide the capability of monitoring a specific target and generating an alarm and/or transmitting video surveillance data on event detection.

- Complete construction of an automated spectrophotometric instrument for sensitive, precise measurement of plutonium based on the Pu(VI) spectrum.

- Complete servo-control and preheater for over/under calorimeter to reduce the time required for a measurement and ultimately reduce radiation exposure.

- Complete field-deployable special nuclear material gamma-ray fingerprint monitor which will compare a measurement of an item to a previous measurement to ensure the nuclear material has not been removed or altered.

- Complete low wattage Mound electrical calibration heater probe which can be used to calibrate calorimeters without using nuclear materials.

- An integrated nuclear materials control and accountability system which contains material and personnel tracking systems, nuclear accountability system, and material control and access systems will be completed and installed at Savannah River Site and other sites throughout the DOE complex.

INFORMATION SECURITY ($3,053)

- Complete security study on trusted data management systems to determine the effectiveness of various research and development tools for preventing uncleared users access to sensitive information.

- Implement a prototype multilevel document management center in DOE.

- Evaluate several new multilevel information system products on DOE test bed network.

- Publish functional requirements for a national software protection service in support of potential on-demand system software authentication program and automated software update capabilities to DOE users.

- Develop computer security incident handling tools in response to contemporary information system vulnerabilities and attackers.

- Demonstrate an automated information system prototype to provide real-time detection and response to unauthorized activities in a computer network.

- Implement first prototype client/server multilevel network in DOE.

- Develop advice and assistance program to help DOE sites protect their electronic perimeters (analogous to fences protecting physical structure perimeters).

- Provide computer security personnel with an up-to-date database of all known computer system vulnerabilities to aid incident response teams in analyzing new breakins.

- Complete implementation of ramped-up monitoring and deliver an integrated graphical user interface network intrusion detection tool to provide better computer security via increased detection.

- Evaluate the commercial security profile inspector tool to ensure it meets DOE computer security functional requirements.

FY 1997 Planned Accomplishments:

PHYSICAL SECURITY ($7,681)

- Field a laser radar technology which will allow the following: three-dimensional imaging of adversaries for a more robust detection capability, a reduced or eliminated requirement for exterior lighting; and a detection system that is resistant to camouflage defeat techniques

- Redesign the cold smoke generator. Smoke obscurants are the most widely used access delay dispensable in the DOE complex and the new design will permit the system life to be extended from 5 to 12 years.

- Develop a door sensor that can be performance tested remotely; a door sensor that can detect sawing or cutting through the door as well as door movement; and a door sensor that is resistant to defeat techniques.

- Produce a smoke obscurant that costs 90% less than current obscurants; increases expected lifetime from 5 years to 20 years; and has no single point vulnerabilities to provide greater access delay capabilities at DOE facilities.

- Develop the ability to detect metals hidden on people that are difficult to detect by metal detectors such as lead. Such materials are likely to be used to shield SNM and defeat metal detectors in theft scenarios.

- Develop the capability to automatically and remotely test infrared, microwave, wall penetration, and ported coax sensors which reduces hazardous exposure to personnel, insider threat, and the cost of the test.

- Increase detection capabilities by developing an integrated system which is capable of screening vehicles for hidden people, contraband, explosives, and nuclear materials.

MATERIAL CONTROL AND ACCOUNTING ($9,782)

- Complete a small sample in-plant calorimeter which will characterize small samples/standards that cannot be accurately and precisely assayed by other techniques.

- Complete a guide on the construction of non-destructive assay calibration materials for the DOE facility user community.

- Demonstrate the acoustic resonance spectroscopy technique as a method to measure holdup. Holdup is special nuclear materials found in such places as ducts and pipes. It must be accurately accounted for to ensure that no material has been stolen or diverted and maintain accountability of nuclear materials.

- Implement an integrated nuclear materials control and accountability system which contains material and personnel tracking systems, nuclear accountability system, and material control and access systems at multiple DOE sites.

- Complete the room-temperature Xenon gamma-ray spectrometer which increases the number of locations that can be measured due to the reduced size of the measurement system equipment.

- Begin optimization of gamma-ray instruments using Monte Carlo methods which reduces the amount of nuclear materials required to develop and calibrate a nuclear material measurement system.

- Expand nuclear material tamper-indicating seals usage to extend inventories and for international inspection use to ensure nuclear materials are not altered or removed.

INFORMATION SECURITY ($3,170)

- Begin development of DOE/National software assurance program to manage (from a security prospective) the rapid and voluminous change in software and operating systems.

- Develop a manufacturer independent automated information system security patch installation tool for use by DOE computer security administrators.

- Develop computer security incident handling tools in response to contemporary information system vulnerabilities and attackers. (Since information system technology is evolving so rapidly, cannot predict specific tool needs this far in advance.)

- Examine/develop methods to archive DOE information system security server contents (with expert systems, hypertext documents, etc) while maintaining user accessibility to the data.

- Create new generic signature detection algorithms that allow users to describe new computer system intrusion threats.

Explanation of Funding Changes FY 1996 to FY 1997:

The Technology and Systems Development program reflects a net decrease of $272,000 from FY 1996 to FY 1997. This reduction is primarily in the Technology Application Program.

CLASSIFICATION/DECLASSIFICATION
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

The majority of the Classification/Declassification program is now funded in the Program Direction budget. The portion of the Classification/Declassification program funded here is primarily provided by Management and Operating (M&O) contractors in the field in support of the ongoing base program as well as support of the declassification initiative. The ongoing base classification program includes the routine review and development of classification guidance. The declassification initiative includes the accelerated review of technical classification guidance to implement fundamental review recommendations and development of advanced technologies to improve the efficiency and productivity of the document declassification review process.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Classification/Declassification	$ 3,911	$ 48 a/	$ 2,254	$ 2,206	4,595%
Total, Classification/ Declassification	$ 3,911	$ 48	$ 2,254	$ 2,206	4,595%

a/ Pending reprogramming increase of $3,000,000 for the Declassification Productivity Initiative.

III. Performance Summary:

FY 1995 Accomplishments:

- Initiated the first systematic and comprehensive examination of the DOE's classification policies ever conducted by the Department with the purpose of declassifying and releasing to the public as much information as possible within our national security constraints.
- Launched the Declassification Productivity Initiative to begin long-range development of innovative technologies that will automate and improve the efficiency and productivity of the declassification process.

FY 1996 Accomplishments (to date and planned):

- Complete the fundamental review of DOE's classification policies and submit recommendations for changes to the Secretary for approval.

FY 1997 Planned Accomplishments:

- Initiate the multiyear effort to develop specific classification guidance to implement those fundamental review recommendations approved by the Secretary.
- Proceed with development of advanced automation technology to improve the productivity and accuracy of the document declassification process which supports the Declassification Productivity Initiative.
- Continue implementation of Executive Order 12958 on Classified National Security Information.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $2,206,000 provides for: $900,000 for the implementation of Executive Order 12958 on Classified National Security Information; $700,000 for further development of advanced automation technology in support of the Declassification Productivity Initiative; and $606,000 to support the base Declassification Program.

FACILITIES OPERATIONS
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives:

Facility operations funds capital equipment to support the Nuclear Safeguards and Security mission in the field offices and at Headquarters.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 3,088	$ 2,688	$ 2,450	$ (238)	(9%)
Total, Facilities Operations	$ 3,088	$ 2,688	$ 2,450	$ (238)	(9%)

III. Performance Summary:

FY 1995 Accomplishments:

- o Provided support to field offices for operations and technology development equipment requirements consistent with level of funding for technology development.
- o Provided support to Headquarters for capitalized computer equipment requirements.
- o Completed alarm system and access control upgrades in several Headquarters program offices.
- o Completed installation and startup of new badging system.

FY 1996 Accomplishments (to date and planned):

- o Provides support to field offices for operations and technology development equipment requirements consistent with level of funding for technology development.
- o Provide support to Headquarters for capitalized computer equipment requirements.
- o Complete procurement and installation of Headquarters Protective Force Radio System.

FY 1997 Planned Accomplishments:

- o Maintain support to field offices relative to needs in support of technology development and to Headquarters for capitalized computer equipment requirements.

- o Provide modification and/or replacement of parts to Headquarters alarm and access control system.

Explanation of Funding Changes FY 1996 to FY 1997:

The reduction of $238,000 is a result of increased AOSS requirements in FY 1997. The funding of AOSS requirements is now supported in the Program Direction budget. As a result, this funding decrease is offset as an increase in the Program Direction budget.

SECURITY INVESTIGATIONS

PROGRAM MISSION

The Security Investigations Program funds background investigations for DOE and contractor personnel who, in the performance of their official duties, require access authorizations for Restricted Data, National Security Information, or special nuclear material.

The GOAL of the Security Investigations Program is to:

Support the common defense and security of the United States by ensuring that only appropriate personnel have access to classified information, special nuclear material, or occupy sensitive positions.

The OBJECTIVES related to these goals are:

1. Reduce the types and numbers of access authorizations consistent with DOE mission changes, the downsizing of the nuclear weapons complex, and other classified programs and activities.
2. Ensure the timely and efficient processing and adjudication of initial access authorization requests and reinvestigations.
3. Support development and implementation of an electronic network among DOE field offices, DOE contractors, the Office of Personnel Management (OPM) and other Federal agencies to reduce the overall access authorization processing time.

PERFORMANCE MEASURES:

1. Conduct approximately 19,000 personnel security clearance investigations and reinvestigations.
2. Reduce the numbers and levels of access authorizations.
3. Meet requirement of Executive Order 12968 dated August 2, 1995, that reinvestigations be conducted with the same priority as initial investigations.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Backlogged reinvestigations have been eliminated; however, current funding shortfalls may create new backlogs beginning in FY 1996 and accelerating in FY 1997.
- Processing and adjudication time frames are being met.
- The number of access authorizations has been reduced by 20 percent in the past 5 years.

SECURITY INVESTIGATIONS

(Dollars in thousands)

I. Mission Supporting Goals and Objectives

The Security Investigations Program funds background investigations for DOE and contractor personnel who, in the performance of their official duties, require access authorizations for Restricted Data, National Security Information, or special nuclear material.

II. Funding Schedule:

Program Activitiy	FY 1995	FY 1996	FY 1997	$ Change	% Change
Federal Bureau of Investigation					
Background Investigations	$ 78	$ 49	$ 49	$ 0	0
Office of Personnel Management					
Initial Background Investigations					
Single Scope Background	15,049	5,993	6,750	757	13
Initial Background	178	74	116	42	57
Limited Background	562	601	598	-3	-1
Reinvestigations					
Periodic Reinvestigaton-SBI	12,512	5,431	8,109	2678	49
Limited Background	0	1,098	1,150	52	5
National Agency Checks	870	699	773	74	11
Related Security					
Investigations Activities	3,550	6,055	4,455	-1,600	-26
Subtotal	32,799	$ 20,000 a/	$ 22,000	$ 2,000	10
Use of Prior-Year Balances	(25,894)	0	0	0	0
Total Security Investigations	6,905	20,000	22,000	2,000	10

a/ Does not reflect the use of at least $13 million in prior-year uncosted balances and $2.3 million in unobligated carryover.

III. Performance Summary: SECURITY INVESTIGATIONS

FY 1995 Accomplishments:

- Continued work on a state-of-the-art electronic transfer program for personnel security clearances between OPM and DOE field offices, DOE contractors, and other Federal agencies to minimize the manual handling of clearances and reduce the overall access authorization time
- Conducted 28,583 personnel security clearance investigations
  - 4,076 initial investigations
  - 11,122 reinvestigations
  - 13,385 National Agency Checks

FY 1996 Accomplishments (to date and planned):

- Due to unanticipated problems in modernization of the clearance program through development of the electronic transfer program, increased efforts will be made to complete this vital system.
- Conduct approximately 27,746 personnel security clearance investigations.
  - 2,300 initial investigations
  - 13,515 reinvestigations
  - 11,931 National Agency Checks
- Continue to reduce the numbers and levels of clearances in excess of those necessary to support the current DOE mission.

FY 1997 Planned Accomplishments:

- Conduct 19,145 personnel security clearance investigations
  - 1,797 initial investigations
  - 6,762 reinvestigations
  - 10,586 National Agency Checks
- The electronic transfer program is expected to be operational throughout DOE.
- Further reduce the numbers and levels of clearances in excess of those necessary to support the current DOE mission.

Explanation of Funding Changes, FY 1996 to FY 1997:

Approximately 43 percent of FY 1996 support comes from use of prior-year uncosted balances and unobligated carryover, which will not be available in FY 1997. It is estimated that 27,746 personnel security clearance investigations will be conducted in FY 1996, and 19,145 investigations will be conducted in FY 1997. The reduced request (down 38 percent from the FY 1996 level of spending) will support 503 less initial investigations and 6,753 less reinvestigations.

III. Performance Summary: SECURITY INVESTIGATIONS

Major Issues:

- o OPM privatization has potential consequences for the Department in terms of cost, efficiency, and effectiveness.
- o The FY 1997 funding level could begin a reinvestigations backlog and inability to conduct required initial investigations.

23-254 96 – 16

479

EMERGENCY MANAGEMENT

PROGRAM MISSION

The Office of Emergency Management serves as the single point of contact and control for all Departmental emergency management and threat assessment related activities and ensures an integrated response to emergencies affecting Departmental operations and activities or requiring Departmental assistance. The principal mission of the Office is to provide comprehensive, integrated emergency planning, preparedness, and response programs throughout the Department and to provide threat assessment support to the Department's Headquarter and field operations. The Office operates the Headquarters Emergency Operations Center and the Department emergency communications network; develops and operates reliable capabilities to detect and assess developing emergency situations and threats; and issues all policy and guidance for the Department's emergency programs. This program also operates the HAZMAT Spill Center (formerly the Liquefied Gaseous Fuels Spill Test Facility) which supports the formulation of emergency management policy for hazardous materials and conducts research in partnership with government and industry.

480

The GOAL of the Emergency Management Program is to:

Support the National Security of the United States by ensuring an integrated Departmental response to all emergencies.

The OBJECTIVES related to this goal are:

1. Maintain national security and ensure protection of workers, the public, and environment.

2. Fully execute a Departmental program in support of other U.S. Government agencies for combating nuclear terrorism and support to crisis and consequence management to any terrorist act.

3. Maintain the capability to provide technical advice and assistance to Departmental elements for cost effective implementation of emergency management programs.

4. Develop, maintain, and promulgate policy; planning and preparedness guidance; and readiness assurance activities.

PROGRAM MISSION - EMERGENCY MANAGEMENT (Cont'd)

5. Operate and maintain the Headquarters Emergency Operations Center and Department emergency communications network.

6. Provide program management for operations of the HAZMAT Spill Center (formerly the Liquefied Gaseous Fuels Spill Test Facility) program.

7. Maintain emergency programs to minimize adverse impacts of energy supply disruptions on national security, public safety and the energy infrastructure.

8. Assess the vulnerabilities of the Nation's energy supply systems.

9. Promote the Department's emergency policy interests in international fora.

PERFORMANCE MEASURES:

1. Conduct 12 emergency management system training and technical assistance workshops.

2. Conduct 6 emergency management system appraisals.

3. Support/conduct 6 Department-wide drills and exercises.

4. Conduct 10 tests at the HAZMAT Spill Center (formerly the Liquified Gaseous Fuels Spill Test Facility).

5. Provide situation assessments within 1 hour after identification of a potential emergency.

6. Conduct emergency assessment conferences for Federal, state, tribal and industry groups.

7. Increase the role and visibility of the Department as a leader in the formulation of National Security related policies for combating terrorist and nuclear materials trafficking.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Conducted additional emergency management system appraisals, training and assistance workshops, and Department-wide drills and exercises.

PROGRAM MISSION - EMERGENCY MANAGEMENT (Cont'd)

- Improved operation of DOE's emergency management system and emergency facilities through technical assistance.
- Increased customer involvement in planning, preparedness, and readiness assurance activities.
- Improved collaborative efforts with Federal, state, tribal and industry entities to prepare for and respond to emergencies.
- Provided situation reports and assessments for developing emergencies.
- Provided an annual report on illicit nuclear material transactions.
- Initiated an Assessment Program in collaboration with the FBI's National Center for the Analysis of Violent Crime.
- Linked the FBI (Quantico, VA) to the Headquarters emergency operations center voice, data and video connection.
- Initiated a departmental program to support other U.S. Government agencies in combating nuclear terrorism and crisis and consequence management to any terrorist act.
- Initiated a program to increase the role and visibility of the Department as a leader in the formulation of National Security related policies for nuclear materials trafficking.

1/ Funding for Emergency Operations Center to support 24 hour operation and communications network.

2/ Funding for dedicated emergency communications network.

I. Mission Supporting Goals and Objectives

The Office develops and implements specific programs, plans and systems to minimize the impact of emergencies on national security, worker and public safety, and the environment. The Office provides overall coordination or consultation regarding the Department's Emergency Management System, including emergency assistance and mobilization activities, energy emergencies, and activities related to emergencies involving hazardous materials (radiological and non-radiological). The Office promulgates Departmental requirements and implementing guidance, and conducts readiness assurance activities to ensure appropriateness and effectiveness. The Office also coordinates inter-agency and intra-Departmental emergency planning and preparedness, as well as coordinating with state and local governments, international agencies and foreign governments, and industry on emergency planning and preparedness issues.

Another mission area is to identify and assess hostile threats to Departmental facilities, interests and personnel and assess the credibility of nuclear threats received world-wide, supporting U.S. Government and allied nations efforts for the prevention of illicit nuclear materials trafficking worldwide. The Office operates and maintains Headquarters 24-hour per day emergency operations facilities for the collection and processing of information relative to emergency notifications and reporting and support of emergency management activities at the Headquarters level and implements a security program for the protection of Office information, equipment, and facilities.

To effectively implement its mission, the Office develops and maintains capabilities to effectively and efficiently integrate and coordinate Departmental response to all emergencies. The Office provides liaison and coordination regarding operational emergency response activities, and monitors the national and international energy supply and distribution networks and infrastructures, providing appropriate situation reports and assessments as part of a coordinated Departmental emergency or pre-emergency response. Additionally, the HAZMAT Spill Center (formerly the Liquified Gaseous Fuels Spill Test Facility) provides the DOE community, other governmental agencies, and private sector customers with a unique training, testing, and technical center for hazardous materials research relating to emergency management.

The Department's Headquarter Emergency Operations Center, 24-hour per day Operations Center Watch Office function, and emergency communication network are supported by a support service contract. The FY 97 planning level for this support is $2.1 million.

These activities are in support of the Atomic Energy Act of 1954, as amended, Presidential Decision Directive 39, Executive Orders 12656 and 12919, the Defense Production Act of 1950 as amended, and environment related regulations including the Resource Conservation and Recovery Act, Superfund Amendments and Reauthorization Act of 1986, Conservation Environmental Response Compensation and Liability Act, and Clean Air Act Amendments of 1990.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Emergency Management	$ 8,724	$ 11,466 1/	$ 11,594 2/	$ +128	+1.1
HAZMAT Spill Center (Formerly Liquified Gaseous Fuels Spill Test Facility)	0	1,600	1,600	0	0
Emergency Operations Support Service Contract	2,500	2,300	2,100	(200)	-8.7
Total, Emergency Management	$ 11,224	$ 15,366	$ 15,294	$ (72)	-0.5

1/ Change is a result of Interior and Related Agencies Appropriation being absorbed into Energy and Water Appropriation in FY 1996.
2/ Does not include funding of $1.1M for the proposed transfer of the Forrestal communications center from Human Resources and Administration to Emergency Management.

III. Performance Summary:

FY 1995 Accomplishments:

- Conducted a full performance test of emergency management system at Idaho.
- Conducted five (5) technical assistance visits to assist Departmental elements in determining program weaknesses and cost effective means for making improvements and five (5) appraisals to ensure necessary improvements are being made.
- Conducted planning, training, and readiness assurance activities to ensure effective implementation of the Department's emergency management system.

PERFORMANCE SUMMARY (Cont'd)

- Evaluated five (5) tests and exercises of Departmental programs to demonstrate effective emergency response.
- Accomplished nation-wide link-up of DOE Operations offices and select National Laboratory emergency operation centers with the Headquarters emergency operations center voice, data, and video connection.
- Linked DOT and FBI to the Headquarters emergency operations center data connection.
- Conducted thirty (30) weeks of user-sponsored spill tests at the HAZMAT Spill Center (formerly the Liquified Gaseous Fuels Spill Test Facility).
- Provided technical assistance to state and local governments to assist recovery from energy emergencies.
- Prepared situation reports on energy problems for senior Departmental officials.
- Provided ten (10) training and assistance workshops to Departmental elements, state, local, and tribal governments.

FY 1996 Accomplishments (to date and planned):

- Conduct and evaluate full performance test of emergency management system at a Departmental site.
- Continue emphasis on emergency management system training and technical assistance workshops.
- Upgrade FBI link to Headquarters emergency operations connection to include full voice and video capabilities.
- Initiated a Departmental program to support other U.S. Government agencies in combating nuclear terrorism and crisis and consequence management to any terrorist act.
- Initiated a program to increase the role and visibility of the Department as a leader in the formulation of National Security related policies for nuclear materials trafficking.
- Increase customer and stakeholder involvement in emergency planning, preparedness, readiness assurance, and Department-wide drills and exercises.
- Link EPA and DNA to the Headquarters emergency operations center voice, data, and video connection.

488

PERFORMANCE SUMMARY (Cont'd)

- Generate after-action reports with findings and recommendations for all emergency situations and exercises involving NN staff and ensure follow-up of appropriate corrective actions to enhance the emergency management system.

- Conduct user-sponsored spill tests for both Government and industry at the HAZMAT Spill Center (formerly the Liquified Gaseous Fuels Spill Test Facility).

- Provide spill test results to Departmental elements, other government agencies, industry and the general public for use in hazards mitigation and emergency responder training programs.

- Respond to natural and man-made disasters as they occur to provide damage assessments and assistance to state and local governments and industry in restoration of essential energy services.

- Assist states in developing all-hazards emergency plans.

- Sponsor emergency assessment conferences for Departmental elements, state, tribal, and local governments and industry groups.

FY 1997 Planned Accomplishments.

- Continue operational enhancement and networking of the Headquarters emergency operations center voice, data, and video connection.

- Continue to provide independent evaluations of Departmental emergency management drills and exercises and conduct a full performance test of the emergency management system at a Departmental site.

- Deliver new emergency management system training and technical assistance workshops developed to meet specific needs.

- Increase customer and stakeholder involvement in emergency planning, preparedness, readiness assurance, and Department-wide drills and exercises.

- Upgrade the HAZMAT Spill Center (formerly the Liquefied Gaseous Fuels Spill Test Facility) to increase attractiveness to industry and other government agencies. Expand the scope of user-sponsored spill testing for both Government and industry.

- Respond to natural and man-made disasters as they occur to provide damage assessments and assistance to state and local governments and industry in restoration of essential energy services.

PERFORMANCE SUMMARY (Cont'd)

- Assist states in developing all-hazards emergency plans.
- Sponsor emergency assessment conferences for Departmental elements, state, tribal and local governments and industry groups.
- Strengthen support to U.S. and international efforts aimed at improving emergency response programs world-wide.
- Continue support to U.S. activities aimed at combating terrorism.
- Strengthen and expand the Department's support for crisis and consequence management in combating terrorism and nuclear material trafficking.

FACILITIES OPERATIONS
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives:

Continue to procure and test new equipment throughout DOE Emergency Operations Centers. Facility operations funds capital equipment to support the emergency management mission.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 2,000	$ 1,500	$ 1,500	$ 0	0
Total, Facilities Operations	$ 2,000	$ 1,500	$ 1,500	$ 0	0

III. Performance Summary:

FY 1995 Accomplishments:

- Expanded equipment capacity to bring additional users on to the DOE network, including DOT and FBI.

FY 1996 Accomplishments (to date and planned):

- Continue to ensure necessary equipment upgrades for further expansion of network to enable other Federal agency and Departmental users to join the network.

FY 1997 Planned Accomplishments:

- Continue enhancements of the network to accommodate all potential users.

NONPROLIFERATION AND NATIONAL SECURITY PROGRAM DIRECTION

PROGRAM MISSION

The Nonproliferation and National Security (NN) Program Direction budget provides funds for all Federal personnel-related expenses, contractual services, and capital equipment which support Federal staff at Headquarters and the Chicago and Nevada Operations Offices who are engaged in the following functions aimed at reducing the global nuclear danger: Nonproliferation and Verification Research and Development, Arms Control, Intelligence, Nuclear Safeguards and Security, Security Investigations, and Emergency Management programs.

The GOAL of Program Direction is to provide a staff that can direct and manage nonproliferation and national security functions critical to ensuring a strong nonproliferation environment, and national security posture both domestically and world-wide. These staff activities include strategic planning and policy development, integration of internal and external policies and directives, intra and interagency representation, technical direction and guidance of programs and projects, program assessment and internal controls, and management of fiscal and personnel resources in an effective and efficient manner.

The OBJECTIVES related to this goal are:

- Provide management, direction, oversight and implementation of programs totalling $586,972,000
- Provide highly qualified technical staff to oversee technology development, research and development projects, and sensitive operational programs
- Provide staff to carry out our statutory requirements, executive directives, national security directives, treaties, bilateral agreements, and emergency response requirements
- Provide professional development and achievement

PROGRAM MISSION NONPROLIFERATION AND NATIONAL SECURITY PROGRAM DIRECTION - (Continued)

PERFORMANCE MEASURES:

Provide salaries, benefits, travel, training, contractual services, and other related costs for Nonproliferation and National Security programs' Headquarters and field Federal employees necessary to meet mission requirements

Continue to balance rightsizing goals of the Strategic Alignment Initiative and the National Performance Review with new programmatic imperatives

Continue to conduct management reviews to assure resources are distributed in a manner consistent with program priorities

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The Office of Nonproliferation and National Security (NN) has met the reductions of the Strategic Alignment Initiative and has redeployed positions to expanding program areas.

- NN has streamlined our organization, going from 74 organizational elements in 1992 to 25 in 1996. We have gone from a ratio of 1.8:1 employees per supervisor to 11:1

- NN has consolidated fiscal and resource management responsibilities, eliminating duplicate activities

- NN has integrated nonproliferation and national security missions in a dynamically changing domestic and worldwide environment

- NN has consolidated safeguards and security responsibilities and functions and eliminated redundancy and duplication with other Headquarters program offices

- It has consolidated DOE emergency management activities making this organization the single manager for the department

PROGRAM MISSION NONPROLIFERATION AND NATIONAL SECURITY PROGRAM DIRECTION - (continued)

BUDGET STRUCTURE CHANGES

In accordance with guidance contained in House Report 104-293, FY 1996 Energy and Water Development Appropriations Conference Report, all Other Defense Activities Federal staff have been transferred from six nonproliferation and national security programs to a new Decision Unit called NN Program Direction (see the comparability matrices for FY 1995 and FY 1996 included in the Nonproliferation and National Security Executive Budget Summary). In addition all support services contracts have been transferred to the new Program Direction decision unit. For FY 1997 the Department will implement a Working Capital Fund which includes "Other Related Costs" such as space, utilities, printing and reproduction, communications, etc. These Other Related Costs have been transferred from the Departmental Administration appropriation to the Nonproliferation and National Security Program Direction Decision Unit.

NONPROLIFERATION AND NATIONAL SECURITY PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities:
The Nonproliferation and National Security (NN) program direction budget provides for all Federal personnel required at DOE Headquarters, and two field offices to carry out the program's mission in a cost effective and efficient manner. It provides salaries and benefits, travel, support service contracts, and other related expenses associated with the overall management, direction, and administration of the following programs:

Verification and Control Technology
- Nonproliferation and Verification Research and Development
- Arms Control Nonproliferation
- Intelligence

Nuclear Safeguards and Security
Security Investigations
Emergency Management

Travel funds required to carry out program mission while away from official duty stations, per diem allowances as well as local travel are carried in this decision unit. Travel is an essential part of staff duties in order to conduct hands-on operations both domestic and international, participate in highly technical agency and interagency committees, and to ensure appropriate Government representation in policy meetings.

Support services contracts funding is included in this decision unit. These contracts support Federal staff at Headquarters and in the field. The daily operation and associated technical direction of the contracts remain with program managers in each organization. These contracts provide technical, analytical, administrative, and operational support in multiple program areas such as safeguards and security, declassification and classification; intelligence activities; emergency management; threat assessment; research and development, and arms control.

Mission Supporting Goals/Ongoing Responsibilities--CONTINUED:
"Other Related Expenses" are identified for all NN space, utilities, general printing, graphics, copying, supplies, telephones, general automation support, SES bonuses, etc. The funding identified in this account was estimated by Departmental Administration using a different historical basis for computing each category (i.e, one month's sampling, square footage, percent of total value of an account, etc.). As requested by Congress, NN has included these estimates in the Program Direction account.

The structure of the Nonproliferation and National Security Program Direction budget follows:

Headquarters:
- Office of the Director and Office of Resource Management (includes a portion of the DOE Hearings and Appeals staff)
- Office of Research and Development
- Office of Energy Intelligence
- Office of Arms Control and Nonproliferation
- Office of Security Affairs
- Office of Emergency Management

Field Offices:
- Chicago
- Nevada

The mission, goals, and management responsibilities for each organizational entity follows:

Office of the Director and Office of Resource Management :
The Office of the Director provides overall executive direction for the Office of Nonproliferation and National Security (NN) in the most effective and efficient manner for carrying out its policies and objectives. The Resource Management Office provides planning, budget, personnel, staffing, administrative, and logistical support for all NN programs, as well as career development training and information management.

The Office of the Director and Resource Management funds are salaries, benefits, and travel for 20 Hearings and Appeals personnel. These personnel serve to make recommendations on the eligibility of an applicant to possess a DOE security clearance. The remaining personnel in the Office of Hearings and Appeals is located in the Interior and Related Agencies appropriation.

Funding for "Other Related Expenses" are carried under this program element.

Mission Supporting Goals/Ongoing Responsibilities--CONTINUED:

The Office of Research and Development:

The Office of Research and Development develops a broad range of advanced technologies tailored specifically for proliferation detection and arms control verification. It manages several hundred applied research, technology development, system fabrication, prototype production, and software tasks. It integrates and coordinates interagency research and development activities on policy and objectives associated with proliferation detection and arms control verification.

This office manages the only U.S. Government research and development program dedicated to providing nonproliferation treaty verification technologies and systems. It provides the technical direction and the interagency coordination of research and development into a broad range of advanced sensor and analytical technologies tailored specifically for proliferation detection and arms control verification. It manages the Verification and Technology Research and Development work performed at the national laboratories which improve our capability to support current as well as future operational and technical requirements.

To facilitate coordination, this office regularly participates in sponsors briefings and technical reviews with the intelligence, arms control, law enforcement and military communities to identify operational shortcomings and technology requirements. The staff serves on ten formal interagency advisory panels including co-chairing the Nonproliferation and Arms Control Technology Working Group, and the department's representative on the Director of Central Intelligence's Community Management Staff, Advanced Research and Development Committee.

The office staff translates technology requirements into development tasks, provides technical guidance and financial direction to the national laboratories, serves as technical liaison within the interagency community, reviews the programmatic and technical progress of ongoing work, develops the programmatic input to the budget, and provides fiscal oversight and documentation. The staff provides technical advice and directs an integrated technical program to support policy development to implement new strategies on cooperative arms control, international safeguard transparencies, current and future treaty verification scenarios, and irreversible nuclear arms reductions.

Office of Energy Intelligence:

The Office of Energy Intelligence provides for the planning, coordination, and implementation of all DOE National Foreign Intelligence Program related activities. A functional profile of a typical analyst includes providing case officer support, current intelligence analysis, program management, and Intelligence Community liaison.

Mission Supporting Goals/Ongoing Responsibilities--CONTINUED:
These intelligence personnel are responsible for the management of all source foreign intelligence and counterintelligence data, providing all appropriate DOE components with current intelligence information required to effectively implement their respective programmatic missions; and maintaining awareness of current and international situations which may affect current or future U.S. energy policies.

Staff responsibilities also include providing the DOE interface with the Intelligence Community through participation in Director Central Intelligence committees, subcommittees, and working groups. Intelligence Community interface is also provided through participation in the National Intelligence Estimate process.

Office of Arms Control and Nonproliferation:
The Office of Arms Control and Nonproliferation mission is to reduce the threat of nuclear proliferation by integrating and orchestrating the Department's assets and efforts, including those of its national laboratories and contractors in providing policy and technical support to the US Government's foreign policy and national security objectives in the areas of arms control and nonproliferation, and to the international arms control and nonproliferation communities.

The Office analyzes arms control and nonproliferation issues and problems, formulates policy, goals and objectives, and determines program priorities for implementing approaches and activities directed at solving identified problems. It directs the program work supporting arms control and nonproliferation of the areas of International Policy and Analysis, Export Control, and International Safeguards, as well as the task force implementing Materials Protection, Control and Accounting in the Former Soviet Union (FSU).

The Office focuses on the following critical program priorities: securing nuclear materials and expertise in Russia and the other Newly Independent States; limiting weapon-usable fissile materials; establishing transparent and irreversible nuclear reductions; strengthening the nuclear nonproliferation regime; and controlling nuclear exports.

The Office personnel represent, as appropriate or directed, the Department of Energy in the U. S. Government's interagency process in arms control and nonproliferation and in the national and international arms control and nonproliferation communities.

Office of Security Affairs:
The Office of Security Affairs encompasses the Office of Safeguards and Security (S&S), and the Office of Declassification.

500

Mission Supporting Goals/Ongoing Responsibilities--CONTINUED:
The Office of Safeguards and Security mission is to ensure adequate protection for nuclear weapons, weapons components, special nuclear material, nuclear facilities, and classified information under the DOE control. It serves as the single manager for the Safeguards and Security program and formulates policies and plans to assure effective protection of DOE facilities and the domestic control and accountability nuclear materials and sensitive information; acts as focal point for interagency matters on S&S; integrates Department wide operations; directs over a hundred technology development projects for domestic protection and integrates interagency policy and activities associated with domestic technology development projects; performs physical protection responsibilities in support of nonproliferation policies and agreements; directs the personnel security program; ensures effective and efficient training of DOE-wide safeguards and security personnel, implements a comprehensive security program for protection of DOE Headquarters facilities, personnel and classified and sensitive matter. Functions include such disciplines as physical security, material control and accountability, personnel security, and technical and information security. Finally, it manages and directs the department's Security Investigations program, the Central Training Academy and the technical direction of the New Brunswick laboratory.

The Office of Declassification directs the ongoing base classification program as well as the declassification initiative. The ongoing base program includes: review and development of classification guidance, conduct of biennial classification appraisals of DOE operations offices, development and conduct of training courses for DOE classification community, and automated classification guidance system updating. The declassification initiative includes the fundamental review of DOE's classification policies, accelerated review of technical classification guidance, accelerated review of documents for declassification, training and certification of declassifiers, and development of advanced technologies to assist document review.

501

The Office of Declassification personnel develop and implement policies to declassify and publicly release information which poses no national security or nonproliferation threat or concern; ensure that DOE policies and procedures are in step with the current national and international environment; evaluate current declassification and classification policies and procedures; continue activities to develop, manage, and implement policies to identify classified information and certain unclassified but sensitive information.

The Office of Declassification manages programs to reevaluate fundamental classification policy; streamline information declassification procedures; accelerate and enhance document review process; develop and implement DOE-wide classification and declassification policies, guidance, and procedures for Restricted Data/Formerly Restricted Data as required by the Atomic Energy Act of 1954, as amended, and for National Security Information as required by Executive Order 12598.

Mission Supporting Goals/Ongoing Responsibilities--CONTINUED:

Office of Emergency Management:

The Office of Emergency Management directs and manages DOE's Emergency Management program and serves as the single point of control and contact for all Departmental emergency management and threat assessment related activities. It ensures an integrated Departmental response to emergencies affecting Departmental operations and activities. The principal mission of the Office is to provide comprehensive, integrated emergency planning, preparedness, and response programs throughout the Department's Headquarter and field operations.

The Office operates the Headquarters Emergency Operations Center, and the Department's emergency communications network; develops and operates reliable capabilities to detect and assess developing emergency situations and threats; and issues all policy and guidance for the Department's emergency programs. This program also operates the HAZMAT Spill Center (formerly Liquified Gaseous Fuels Spill Test Facility) which supports the formulation of emergency management policy for hazardous materials and conducts research in partnership with government and industry.

This office develops and implements specific programs, plans and systems to minimize the impact of emergencies on national security, worker and public safety, and the environment. It develops policy, provides coordination or consultation on emergency assistance and mobilization activities, energy emergencies, hazardous materials (both radiological and non-radiological), promulgates DOE requirements and implementing guidance, conducts readiness assurance activities and coordinates interagency and intra-departmental emergency planning and preparedness. It assesses hostile threats to DOE facilities, interests and personnel, and assesses credibility of nuclear threats, and supports efforts for the prevention of illicit nuclear materials trafficking worldwide. This office operates and maintains a 24 hour round-the-clock Headquarters emergency operations facility. It is responsible for integration of emergency response capabilities, liaison and coordination of operations emergency response, and also monitors national and international energy supply and distribution networks and infrastructures.

OPERATIONS OFFICES

Chicago Operations Office

- New Brunswick Laboratory (NBL) is a federally staffed laboratory funded through the Program Direction account, but technically managed and directed by the Office of Safeguards and Security. NBL is the Center of Excellence in nuclear materials measurement. It provides technical expertise in the areas of measurement science and material accounting . NBL provides reference materials to meet requirements for nuclear measurement control and calibration for verification of materials in process or storage. The laboratory also performs technical audits of safeguards practices in the DOE complex to assess special nuclear material protection system effectiveness.

Mission Supporting Goals/Ongoing Responsibilities--CONTINUED:

- Chicago Safeguards and Security Office manages and directs the on-site safeguards and security program for the Chicago office. It advises, assists and supports Program Managers, Area Office Managers, and Contracting Officers in the development and implementation of effective and efficient S&S programs.

Nevada Operations Office provides for a Federally staffed Proliferation Response Team within the Nevada Operations Office. This team has functions in Nevada's management of Arms Control Research and Development's for such areas as: treaty negotiation, treaty verification equipment maintenance, and personnel development and maintenance for DOE field treaty support and management, as well as contractual support to DOE Headquarters for the U.S. Nuclear Terrorism Communicated Threat Program.

a/ See the comparability matrices for FY 1995 and FY 1996 included in the Nonproliferation and National Security Executive Budget Summary

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- Managed, directed, and implemented the following programs: nonproliferation and verification research and development; arms control; intelligence; nuclear safeguards and security; security investigations; and emergency management.
- Reviewed, coordinated, and performed "hands-on" as well as technology assistance to Departmental sites and National Laboratories to resolve problems related domestic safeguards and security.
- Reviewed and coordinated requests and provided technical direction for technology and procedural assistance to Departmental sites, state and local governments, Indian Tribes, and contractor facilities concerning emergency response activities related to Departmental operations.
- Formulated, presented, and executed a $472 million budget for internal purposes, and for the Department's senior management, the Executive Branch, and the Congress. Prepared and presented testimony on NN programs to Congressional committees, subcommittees, and staff
- Responded to informal and formal inquiries from the Congress, the General Accounting Office, and the Inspector General on program policy and management issues
- Developed, or teamed in the development of National Intelligence estimates
- Prepared analytical pieces for use by the interagency policy community
- Fulfilled intelligence responsibilities assigned to the Department by Executive Order 12333.
- Consolidated Safeguards and Security roles and responsibilities in line with Strategic Alignment initiative. Removed duplication and redundance of safeguards and security activities, and empowered the field on implementation activities.
- Reviewed 450,000 documents for declassification purposes.
- Expanded public access to DOE information by developing a publicly available computer database (known as OpenNet) which contains bibliographic information on over 250,000 publicly releasable, declassified documents.
- Conducted 43 training courses, which included courses for Classification Officers and Analysts, authorized classifiers and declassifiers, Unclassified Controlled Nuclear Information Reviewing Officials, and document reviewers in other agencies.
- Conducted classification appraisals of four field offices, which included assessments of large-scale document review programs at two of the field offices appraised.
- Conducted full performance test of emergency management system at Idaho
- Conducted 5 technical assistance appraisals to assist Departmental elements in determining program weaknesses and cost effective means for making improvements
- Conducted planning, training, and readiness assurance activities to ensure effective implementation of the Department's emergency management system
- Conducted tests and exercises of Departmental programs to demonstrate effective emergency response

Performance Summary--CONTINUED:

- Accomplished nation-wide link-up of DOE Operations offices and select National Laboratory emergency operation centers with the Headquarters emergency operations center voice, data, and video connection
- Linked DOT and FBI to the Headquarters emergency operations center data connection
- Conducted 7 user-sponsored spill tests at the HAZMAT Spill Center
- Provided technical assistance to state and local governments to assist recovery from energy emergencies
- Prepared situation reports on energy problems for senior Departmental officials

FY 1996 Measurable Performance Activities:

- Manage, direct, and implement the following programs: nonproliferation and verification research and development; arms control; intelligence; nuclear safeguards and security; security investigations; and emergency management.
- Review, coordinate, and perform "hands-on" as well as technology assistance to Departmental sites and National Laboratories to resolve problems related to domestic safeguards and security.
- Review and coordinate requests and provide technical direction for technology and procedural assistance to Departmental sites, state and local governments, Indian Tribes, and contractor facilities concerning emergency response activities related to Departmental operations.
- Formulate, present, and execute a $576 million budget for internal purposes, and for the Department's senior management, the Executive Branch, and the Congress. Prepare and present testimony on NN programs to Congressional committees, subcommittees, and staff
- Respond to informal and formal inquiries from the Congress, the General Accounting Office, and the Inspector General on program policy and management issues
- Fulfill intelligence responsibilities assigned to the Department by Executive Order 12333 by satisfying high priority Departmental intelligence needs through effective interaction with the Intelligence Community.
- Develop a Nonproliferation and National Security Strategic Plan.
- Develop a 5-year nonproliferation research and development program plan as requested in the National Defense Authorization Act for FY 1996.
- Submit a report on Security Investigations to Congressional defense committees consistent with National Defense Authorization Act for Fiscal Year 1996.
- Manage and direct the DOE safeguards and security program.
- Review 450,000 documents for declassification purposes.
- Continue to expand the number of declassified documents referenced on OpenNet.
- Conduct 45 training courses, which will include courses for Classification Officers and Analysts, authorized classifiers and declassifiers, Unclassified Controlled Nuclear Information Reviewing Officials, and document reviewers in other agencies.

Performance Summary--CONTINUED:

- Conduct classification appraisals of five field offices, which will include assessments of large-scale document review programs at four of the field offices appraised.
- Begin implementation of Executive Order 12958 on Classified National Security Information.
- Evaluate and support two full performance tests of the emergency management system at Department sites
- Continue emphasis on emergency management system training and technical assistance workshops
- Link FBI to the Headquarters emergency operations center voice and video connection
- Link EPA and DNA to the Headquarters emergency operations center voice, data, and video connection
- Conduct 9 user-sponsored spill tests for government and industry at the HAZMAT Spill Center
- Assist states in developing all-hazards, all-fuels emergency plans
- Sponsor energy industry emergency/security committees
- Respond rapidly to natural and man-made disasters to provide damage assessments and assistance to governments and industry in restoration of essential energy services

FY 1997 Measurable Performance Activities:

- Manage, direct and implement the following programs: nonproliferation and verification research and development; arms control; intelligence; nuclear safeguards and security; security investigations; and emergency management.
- Review, coordinate, and perform "hands-on" as well as technology assistance to Departmental sites and National Laboratories to resolve problems related domestic safeguards and security.
- Review and coordinate requests and provide technical direction for technology and procedural assistance to Departmental sites, state and local governments, Indian Tribes, and contractor facilities concerning emergency response activities related to Departmental operations.
- Formulate, present, and execute a $586 million budget for internal purposes, and for the Department's senior management, the Executive Branch, and the Congress. Prepare and present testimony on NN programs to Congressional committees, subcommittees, and staff
- Respond to informal and formal inquiries from the Congress, the General Accounting Office, and the Inspector General on program policy and management issues
- Fulfill intelligence responsibilities assigned to the Department by Executive Order 12333. Satisfy high priority Departmental intelligence needs through effective interaction with the Intelligence Community.
- Ensure that the Department's unique expertise can be utilized by the Intelligence Community to further US intelligence objectives.
- Have a direct impact on the policy making process by providing actionable intelligence that reaffirms or amends existing policy, or initiates new policy actions.
- Manage and direct the DOE safeguards and security operations and technology development program.
- Manage and direct the DOE Security Investigations program.
- Review 450,000 documents for declassification purposes.

Performance Summary--CONTINUED:

- Continue to expand the number of declassified documents referenced on OpenNet.
- Conduct 43 training courses, which will include courses for Classification Officers and Analysts, authorized classifiers and declassifiers, Unclassified Controlled Nuclear Information Reviewing Officials, and document reviewers in other agencies.
- Conduct classification appraisal of four field offices, which will include assessments of large-scale document review programs at all of the field offices appraised.
- Proceed with development of advanced automation technology to improve the productivity and accuracy of the document declassification process which supports the Declassification Productivity Initiative.
- Proceed with implementation of Executive Order 12958
- Conduct 10 tests at the HAZMAT Spill Center
- Conduct 12 emergency management system training and technical assistance workshops
- Support/conduct six Department-wide drills and exercises
- Provide situation assessments within 2 hours after identification of a potential energy emergency
- Conduct two seasonal energy assessment conferences for Federal, state and industry groups
- Review and coordinate field requests for assistance and provide assistance to field offices and contractor sites to resolve safeguards and security related problems.
- Serve on multiple safeguards and security committees and interagency committees to integrate Government-wide safeguards and security activities
- Direct over 100 safeguards and security technology develooment tasks at major laboratories and contractor facilities
- Summarize, review, and analyze the Department's Safeguards and Security Crosscut Estimates
- Implement and administer personnel security program for DOE headquarters
- Develop briefings, technical reports, maintain liaison with other Federal agencies, attend meetings, review and analyze reports,
- Prepare technical and administrative briefings, prepare testimony and defend programs, prepare internal, OMB and Congressional Budgets
- Update and revise existing policies
- Conduct management analysis studies and program reviews
- Prepare program plans, 5-year plans, and strategic plans
- Respond to Inspector General and GAO reports, OMB and Congressional inquires
- Implement office automation

IV. Explanation of Funding Changes FY 1996 to FY 1997:

Salaries and benefits increased $5,449,000 from FY 1996 to FY 1997. This results from a net increase of 15 FTE's in the NN headquarters organizations ($3,390,000) and ($2,059,000) for escalation, buyouts benefits, and miscellaneous expenses.

The SAI will revisit reallocation of FTE's during FY 1997, and because of the high priority currently placed on nonproliferation and national security, it is anticipated that additional FTE's will be allocated to NN during the reallocation process.

Travel increased $159,000 to cover the additional 15 FTEs being funded in FY 1997.

Support Services contracts increased by $5,168,000 from FY 1996 to FY 1997. This primary increase is in the Declassification program ($4,050,000) to provide additional support to work on Executive Order 12958 and DPI. The Intelligence program has an increase of $742,000 to cover Counterintelligence activities and Arms Control activities increased by $502,000 to cover export control, nuclear nonproliferation, and analytical support, and verification R&D $75,000. There was a modest decrease in Nuclear Safeguards and Security and Emergency Management contracts ($-201,000).

Other Related Expenses increased $2,037,000 from FY 1996 to FY 1997. Rental payments to GSA, including communications, utilities, and miscellaneous charges ($297,000), printing and reproduction ($71,000), other services ($1,060,000), operation and maintenance of equipment ($177,000), equipment ($472,000) and a reduction of $40,000 in supplies and materials.

V. Explanation of Average FTE Costs

FY 1997 is the first year for a Program Direction Decision Unit for the Office of Nonproliferation and National Security. The fully loaded cost per FTE is approximately $226,000. However, exclusion of support services contract dollars reduces that cost to approximately $147,000 per Federal FTE.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST

ENVIRONMENT, SAFETY AND HEALTH

EXECUTIVE BUDGET SUMMARY

Mission:

The Office of Environment, Safety and Health (EH) works with line program managers to develop tools needed to manage safety at our facilities more effectively and at less cost to taxpayers. The Office has demonstrated that the Department can do its work better, more safely, and at less cost by integrating safety into the planning and execution of work. Safety is no longer viewed as an "add-on" that produces only paper and needless cost, but as an asset that allows efficient targeting of the most urgent risks, most efficient use of limited resources, and effective accomplishment of work.

The EH independent oversight program has been extremely useful in helping the Department effectively target risk. Comprehensive assessments provide DOE management with validated, professional appraisals of the site's performance, greatly aiding its ability to target resources to areas of greatest risk to workers, the public, and the environment. The foundation of the new approach is an analytic framework or "template" that clearly articulates the principles and operational elements of sound ES&H management programs. The template allows assessments to be based on clearly defined principles and performance expectations and not just on inspector's view.

The Office of Environment, Safety and Health (EH) is a corporate resource that fosters Departmental excellence through innovative leadership in the protection of workers, the public, and the environment. This commitment to excellence will be demonstrated by striving for continuous improvement in developing meaningful programs and policies; conducting independent oversight of environment, safety, and health performance; and providing technical resources, assistance, and information sharing domestically and abroad. Open communication, participation, and performance feedback on EH activities from relevant parties are integral to EH's success. EH seeks to ensure that Department of Energy (DOE) activities are conducted in a way that prevents accidents or injuries to workers and the public, and prevents harm to the environment. As the equivalent of a "corporate resource" for DOE, EH is the major source of expertise in disciplines such as environmental protection, nuclear safety engineering, public health, industrial hygiene, radiation protection, construction safety, risk management, epidemiology, and occupational medicine. Our goal is to leverage our resources and skills in a way that provides DOE's line management programs with the tools it needs to protect workers, the public, and the environment at DOE sites.

This goal takes on increasing urgency and complexity as DOE faces unprecedented hazards at its facilities, especially in the nuclear weapons complex. As a result of more than 50 years of nuclear weapons production and the rather sudden end of the Cold War, DOE harbors the largest

inventories of hazardous materials in the world outside of the former Soviet Union. Much of this material -- plutonium, spent fuel, and hazardous chemicals -- is stored in aging and deteriorating facilities, and in conditions and buildings that are in themselves hazards to workers. We lack reliable data for many of these facilities on the most basic issues, such as electrical and ventilation systems. DOE is also transitioning to new missions of weapons dismantlement, environmental cleanup, and decontamination and decommissioning. These newer tasks challenge DOE workers with highly dynamic and changing workplaces, where hazards are numerous and varied and exposures are unknown and unpredictable.

The overall major goals and objectives include the following.

Goal 1: Establish a standardized corporate independent oversight process that provides a credible process for appraising the effectiveness of environment, safety, health, and safeguards and security programs throughout DOE. To accomplish the goal of corporate independent oversight, the following objectives have been established: (a) identify, prioritize, and target Departmental needs for independent oversight; (b) incorporate the DOE's safety management guiding principles into all oversight activities; (c) institutionalize a coordinated and consistent independent oversight for the DOE; and (d) disseminate lessons learned to reinforce good practices of work planning, hazard analysis, and hazard control.

Goal 2: Establish a quality (timely, efficient, and effective) assistance program. To accomplish this technical assistance goal, the following objectives have been established: (a) establish management structure and supporting systems to achieve an effective technical assistance program; (b) identify potential environment, safety, and health assistance needs; (c) establish a priority-setting system for processing requests for assistance and delivering quality environment, safety, and health assistance; (d) continuously improve technical assistance through feedback; and (e) develop an outreach plan and program for technical assistance.

Goal 3: Develop an effective system of policies, rules, orders, and standards. To accomplish this policy/standards goal, the following objectives have been developed: (a) identify policy, requirements, guidance, and standards in existing environment, safety, and health orders; (b) develop a framework for order restructuring; (c) integrate orders' component parts into new environment, safety, and health orders system; and (d) implement a process to assess and improve the effectiveness of the new environment, safety, and health order system in protecting the environment and enhancing public and worker safety and health.

Goal 4: Establish a National Environmental Policy Act (NEPA) process that encourages managers to use NEPA, builds public trust, and minimizes cost and preparation/review time. To accomplish this NEPA goal, EH has established the following objectives: (a) implement NEPA contract reforms that provide incentives for quality and timely performance; (b) implement changes to improve the NEPA process; (c) implement additional reforms for high priority projects to deal with situations where schedule is of paramount importance; (d) implement enhancements for public involvement to encourage and facilitate public participation throughout the NEPA process; and (e) form a quality team to analyze the environmental impact statement process and recommend improvements.

Goal 5: Improve environment, safety, and health performance and management accountability by leading DOE-wide implementation of environment, safety, and health business and budget planning processes. To accomplish this goal, EH has established the following objectives: (a) develop and support implementation of a DOE-wide environment, safety, and health budget and planning process that defines scope, identifies costs, prioritizes activities based on relative risk, and allocates resources against established commitments in a visible manner for implementation of environment, safety, and health program activities; (b) improve environment, safety, and health performance through the application of total quality approaches to environment, safety, and health management processes; and (c) integrate environment, safety, and health in all Departmental business functions.

Goal 6: Establish an integrated information management program. To accomplish this goal, EH's objectives are: (a) formalize the information management function; (b) provide quality environment, safety, and health information to the public, EH, DOE, and other stakeholders; (c) provide users effective communication, sharing, and processing of quality information; and (d) continuously improve management of information.

Goal 7: Carry out EH's mission in an open, trustworthy, and responsive manner. To accomplish this goal, EH's objectives are: (a) establish and implement programs that strengthen the public's trust, confidence, and respect in and for EH; (b) establish and implement programs that strengthen the credibility and trust of EH by Departmental and contractor employees; and (c) support the Department's efforts in the reduction of national security information and to minimize future classification.

513

EH is modeled after private corporations with the best environment, safety, and health records. Based on the premise that systems that effectively manage environment, safety, and health are also the key to improving the cost-effectiveness and efficiency of work, EH develops management systems for the line programs that proactively identify and efficiently cope with hazards before they cause accidents, disease, or environmental contamination.

The legal requirements that affect the activities of the EH organization include all environmental, safety, and health Federal regulations, as well as legislation such as the National Defense Authorization Act for Fiscal Year 1995.

Strategy:
EH's intent is to assure that quality, objectivity, responsiveness and innovation are hallmarks of all EH activities. In addressing EH's future posture and direction, planning began by identifying and capitalizing on current strengths and proceeding toward accomplishment of well-defined goals and objectives. EH focuses on developing management-level analytical products, reducing redundancies in DOE, and enhancing staff development. Since EH is the Departmental advocate for excellence in programs to protect the environment, as well as the health and safety of workers at DOE facilities and the public, EH serves its principal customers in the following major areas: (a) the development and establishment of environmental, safety, and health policies and rules for operation of Departmental facilities that are effective, and efficient; (b) conduct of independent oversight activities that provide a comprehensive status of environment, safety, health, and safeguards and security performance at

DOE facilities; and (c) technical assistance to the Department's programs to foster the identification and resolution of environment, safety, and health issues.

Major Changes:
The Office of Environment, Safety and Health (EH) works with line program managers to develop tools needed to manage safety at our facilities more effectively and at less cost to taxpayers. The Office has demonstrated that the Department can do its work, better, more safely, and at less cost by integrating safety into planning and execution of work. Safety is no longer viewed as an "add-on" that produces only paper and needless cost, but as an asset that allows efficient targeting of the most urgent risks, most efficient use of limited resources, and effective accomplishment of work. At Fernald, for example, the Department avoided nearly $2 million in costs by recognizing and avoiding unnecessary work. Safety personnel worked side by side with engineers, planners, and other workers to "build in" safety and health concerns into the actual planning of work. In much the same way, $500,000 was saved at a facility at the Hanford plant. This approach to work planning is to become standard practice throughout the DOE complex and will continue to save taxpayers millions of dollars year after year while also making work safer.

Vulnerability assessments led by the Office of EH identified conditions or weaknesses in the way we handle spent fuel, plutonium and hazardous chemicals that could affect the public or worker health or the environment. These analyses have allowed the Department to better set priorities and direct resources toward the most urgent risks. Overall, 281 of 503 corrective actions identified in the spent fuel report have been completed and 64 of 152 plutonium milestones have been met. For example, at the Hanford K-basins, actions were developed and will soon be implemented to remediate what were identified as the highest spent fuel risks in the complex. At Savannah River, the FB-Line and F-Canyons are operating and stabilizing plutonium solutions.

514

A critical challenge today in DOE is doing new types of work and doing it at facilities that are no longer in sync with the Department's rules and orders. These "top down" orders were developed to meet the needs of a stable weapons production system. Decontamination, decommissioning, and environmental cleanup, on the other hand, involved hundreds of individual tasks in aging facilities with hazards that are unknown and difficult to predict. Many old, poorly-maintained buildings don't meet today's building codes and safety standards. The "Necessary and Sufficient Process" provides a graded approach to safety standards that allow us to tailor the standards to the work and the facilities. In a pilot application of this process at a major Hanford facility, we were able to greatly reduce worker exposure while cutting costs by 50 percent. The Department plans to use this process to proceed with safe and timely stabilization of facilities at Rocky Flats and other locations throughout the DOE complex.

The EH independent oversight program has been extremely useful in helping the Department effectively target risk. Comprehensive assessments providing DOE management with validated, professional appraisal of the site's performance, greatly aiding its ability to target resources to areas of greatest risk to workers, the public, and the environment. The foundation of the new approach is an analytic framework or "template" that clearly articulates the principles and operational elements of sound ES&H management programs. The template allows assessments to be based on clearly defined principles and performance expectations and not just one inspector's view. In December 1994, EH was reorganized along core

functional areas. The independent oversight of environment, safety, health, and safeguards and security activities were placed in one organization. Technical Assistance and Policy functions were also realigned. Health Studies encompass all the International Programs including Marshall Islands, as well as Occupational Medicine, and Epidemiologic Studies. This realignment assists EH in streamlining and providing the Department with a smaller, more technically adroit and more flexible EH organization.

In FY 1997, the budget structure of EH is changed to reflect the major business lines identified in its strategic plan. These business lines are Technical Assistance, Oversight, Policy, Health Studies, Radiation Effects Research Foundation program, NEPA, and Management and Administration, and they are divided into two major accounts (Non-Defense and Defense). Each account also has a Program Direction Decision Unit. Separation of these functions provides for avoidance of conflict of interest, as delineated in the Secretary's response to Section 3163 of the Fiscal Year 1995 National Defense Authorization Act. For example, the staff conducting oversight activities will be independent of both line management and technical assistance efforts and will be free of conflicts of interest that would compromise independence. Also, oversight funded in Other Defense Activities is not responsible for policy. The non-defense activities encompass technical assistance and policy operations, therefore providing for clear separation of functions along appropriation accounts as well as business lines.

Finally, savings in the EH program have been realized from reduced use of support services, improved productivity from Federal workforce, and reorganization along business lines that eliminated redundancies and refocused programs on prevention and providing practical, timely information to managers. Support service contracts have been reduced and consolidated from FY 1995 to FY 1997. FTEs were at 452 in FY 1995 and will be reduced to 422 in FY 1997. Travel expenditures will be reduced by approximately 20 percent from FY 1995 to FY 1997.

PROGRAM MISSION

The Office of Environment, Safety and Health (EH) is a corporate resource that provides leadership and Departmental management excellence to protect the workers, the public, and the environment. This commitment to excellence is demonstrated by striving for continuous improvement to develop meaningful programs and policies; conducting independent oversight of environment, safety, health, and safeguards and security performance; and providing technical assistance, resources, and information sharing. Open communication, participation, and performance feedback on EH activities from affected parties are integral to the EH's success. The hallmark and highest priority of all EH activities is daily excellence in the protection of the workers, the public, and the environment. Program Direction is a separate decision unit in the Other Defense Activities appropriation. As part of the reorganization of the Office of Environment, Safety and Health, operations were streamlined along business function activities. In order to streamline budget activities, the Other Defense Activities (which prior activities were Security Evaluations and Nuclear Safety that both previously were predominantly oversight functions) now also encompass Weapon Activities (Dose Reconstruction, Marshall Islands and Representative to the Defense Nuclear Facilities Safety Board); Defense Environment Restoration (Dose Reconstruction); and Energy Supply, Research and Development (Health Studies and Oversight). These activities are divided along business lines which are Oversight and Health Studies. The activities performed by these business lines are as follows:

523

OVERSIGHT: These activities provide information and analysis needed to ensure that the Department of Energy (DOE) and contractor management, the public, the Secretary of Energy, and the Assistant Secretary for EH have an accurate, comprehensive understanding of the effectiveness, vulnerabilities, and trends of the Department's environment, safety, and health, and safeguards and security policies and programs. These activities include the Site Residents Program, Assessments, Accident Investigation, Analysis, Price-Anderson Enforcement, and the Departmental Representative to the Defense Nuclear Facilities Safety Board (DNFSB).

HEALTH STUDIES: These activities include International Health Programs, such as Marshall Islands; Occupational Medicine focussing on medical surveillances; Epidemiologic Studies, which encompasses the State Health Agreement program; and a Memorandum of Understanding with the Department of Health and Human Services.

The **GOALS** of the EH **Defense** programs are to continually provide improved Department-wide environment, safety, and health support through:

- Having consistent, multidisciplinary credible oversight processes for appraising the effectiveness of environment, safety, health, and safeguards and security programs. Coordinate processes with field and program offices. Report appraisal results to DOE senior management, the Congress, and the DNFSB.

- Using epidemiologic studies to examine possible linkages between exposures or conditions at DOE sites and adverse health effects among groups of workers and offsite populations, and to oversee epidemiologic studies on the health of population groups in the Marshall Islands who have been exposed to ionizing radiation.

- Promoting high quality workplace medical services to DOE and contractor employees.

The **OBJECTIVES** related to these goals are:

- Identify, prioritize, and conduct inspections and special studies to determine the effectiveness of the Department's environment, safety, health, and safeguards and security policies and programs by providing coordinated and consistent independent oversight to customers.

- Report appraisal results to DOE senior management, the Congress, and the DNFSB.

- Disseminate lessons learned and exemplary practices to enhance performance and safety.

- Support periodic and systematic collection, analysis, and sharing of data about workers' health and workplace conditions, with the aim of detecting and preventing adverse effects of workplace exposures while assisting in the determination of the health impacts of DOE operations on workers and host communities.

- Investigate the effects of radiation exposure on the exposed populations in the Marshall Islands.

- Improve the performance and effectiveness of the Department's workforce and contractor employees in matters related to environment, safety, health, and safeguards and security.

- Investigate the effects of radiation exposure on the children exposed by the Chernobyl accident and exposed populations in the Former Soviet Union and Eastern Europe.

524

PERFORMANCE MEASURES: Performance measures related to environment, safety, and health activities are primarily qualitative rather than quantitative. However, some quantitative performance measures are:

- Downward trends in previously identified issues that lead to environmental releases, worker injury, and illness.
- Increased customer satisfaction with oversight priorities, timeliness, consistency, and quality.
- Significant environment, safety, health, and safeguards and security issues identified at one site do not recur at that site or other sites.
- At-risk worker populations are identified and appropriate mitigation measures are employed to avoid adverse health outcomes that include implementation of a program that establishes systematic linkages between job/task analyses, exposure assessments, medical monitoring, and epidemiological analysis.
- Initiation of investigation of health concerns is reduced to within 30 days of identification.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS: Significant accomplishments and program shifts are defined within the respective business line descriptions that follow.

PROGRAM PERFORMANCE SUMMARY:

Mission Supporting Goals and Objectives

The mission of the oversight program is to provide the information and analysis needed to ensure that the Secretary of Energy, Assistant Secretary for Environment, Safety and Health, Department and contractor management, Congress, stakeholders, and the public have an accurate and comprehensive understanding of the effectiveness, vulnerabilities, and trends of the Department's environment, safety, health, and safeguards and security policies and programs. The major goal is to assure that Federal managers are held accountable for environment, safety, and health performance. The safety management template states that line managers are responsible and accountable for safety; comprehensive requirements exist, are executed, and are appropriate; and competence is commensurate with responsibilities.

Site Residents provide real time information on line worker safety and health performance and verify closure and/or performance of DOE's environment, safety, health, and safeguards and security responsibilities.

Assessments provide independent safety management evaluations of environment, safety, health, and safeguards and security programs across the complex.

Accident Investigation Program has been re-engineered to reduce contractor dollars, increase effectiveness, and streamline the accident investigation process.

Analysis utilizes site profile data as a foundation for setting priorities, tracking progress, and focusing inspections.

Enforcement provides oversight of the Price-Anderson Enforcement activities of the Department.

Defense Nuclear Facilities Safety Board (DNFSB) provides the Department liaison representation to the DNFSB.

Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997 Request	$ Change	%Change
Site Residents	$1,500	$1,250	$1,100	-$150	12%

Total Oversight	$18,300	$16,245	$14,526	-$1,719	11%

530

Performance Summary

FY 1995 Accomplishments

- Restructured into an oversight organization evaluating the effectiveness of DOE's environment, safety, health, and safeguards and security programs by consolidating fragmented environment, safety, and health functions into a comprehensive oversight program and combining and reorienting two redundant on-site programs.
- Conducted environment, safety, and health comprehensive inspections at Rocky Flats, Idaho, and Savannah River and safeguards and security comprehensive inspections at Pantex, Sandia, and Nevada.
- Special Reviews conducted were the following: Suspect/Counterfeit Parts; Molten Salt Reactor; Radiation Protection; Emergency Management Operations; Review of Radiological Incidents at Sandia National Laboratory; Occurrence Reporting Programs within the DOE; Safety in Safeguards and Security; Initial Review of Hoisting and Rigging Incidents; and Nuclear Related Equipment Review Department-wide.
- Developed and implemented a program that adds value and satisfies the requirements of external and internal constituents.
- Developed site profiles that provide a foundation for establishing priorities, tracking progress, and keeping inspection activities focused.
- Continued reduction in utilization of contractors, increased reliance on Federal staff.
- Conducted the Accident Investigation of the Rappelling Fatality at Savannah River.
- Performed follow-up by EH Residents targeting the most significant issues, and monitored line management effectiveness in resolving issues and identifying barriers to progress.
- Promoted continuous improvement in the Department's performance through value-added and cost recovery impact on field performance in meeting Departmental goals.
- Established and implemented a Price-Anderson Enforcement Coordination program in cooperation with the DOE Field and Program Offices at each DOE nuclear site; established a Noncompliance Reporting and Tracking System for nuclear safety enforcement; and issued DOE's enforcement guidance document on decision-making processes for Price-Anderson enforcement actions. Completed two major investigations at nuclear facilities (Pantex and Rocky Flats) involving multiple nuclear safety concerns and criticality issues.

FY 1996 Accomplishments (to date and planned)

- Implemented technical qualifications program.
- Institutionalize the oversight process and implement a program that transcends individuals and becomes a vital and ongoing part of the operation of the Department over the long term.
- Verify system utilization for trending and analysis of data to minimize oversight visits.
- Provide credible and effective oversight through the application of a safety management template and extensive as well as focused inspections forming a fully functional program.
- Continue reduction in contractor utilization and increase reliance on Federal staff.
- Validate the site profiles (detailed analysis of site specific hazards) of all DOE major facilities.
- Implement inspection of the Departmental Standards Committee necessary and sufficient process.
- Implement analytic framework or "template" that clearly articulates the principles and operational elements of sound environment, safety and health management programs.

FY 1997 Planned Accomplishments

- Increase safety by promoting effective safety management and identifying areas that require improvement, as well as continually focusing on line management's performance.
- Continue reduction in contractor utilization and increase reliance on Federal staff.
- Perform follow-up by EH Residents on identified problems, provide near real-time updates on progress toward correcting the problems, and update the site profiles on a regular basis. ($1.1 million)
- Provide credible and effective oversight through a fully functional program of analysis and inspections. The program should be making significant progress toward making safety management a part of the DOE culture. Through indepth analysis, Oversight will be able to teach and track safety issues, providing managers with practical, real time information. Ultimately, with a clear understanding of safety issues, DOE will add value and increase productivity in a safer environment. ($12.2 million)
- Continue streamlining the accident investigation program. ($0.4 million)

- Provide representative liaison with the DNFSB. ($0.5 million)

- Provide enforcement of Price-Anderson activities. ($0.3 million)

Explanation of Funding Changes FY 1996 to FY 1997

- Reduction and streamlining of contractor utilization to achieve cost savings of $1.7 million. Improved productivity from Federal workforce.

- Reorganization of all independent oversight activities into one organization eliminated redundant oversight of the field from Headquarters, and, therefore, provided cost savings to the field on the impact of these activities. Refocused oversight providing practical, timely information to managers.

PROGRAM PERFORMANCE SUMMARY:

Mission Supporting Goals and Objectives

The Health Studies program promotes the health and safety of DOE's workers and communities surrounding Department sites, and supports research to understand the effects of radiation on humans. It is comprised of three programs: International Health Studies, Occupational Medicine, and Epidemiologic Studies. The results of the research supported in the International Health Studies area provide the technical basis for developing radiation protection standards for the public and the environment based on human exposures to varying levels of ionizing radiation. Further, the Marshall Islands Program supports direct medical surveillance and medical care to radiation-exposed populations. In the Occupational Medicine area, the Health Studies Program provides the Department's occupational medicine clinics with tools such as a paperless system that automatically links medical, exposure and job information into one record per worker. This system and other such tools are developed to assist these clinics in identifying and tracking occupationally-related health effects among worker populations and identifying opportunities to initiate preventive or mitigative measures. In the Epidemiologic Studies area, worker populations and communities surrounding DOE sites are studied to identify health impacts associated with the operation of DOE facilities and provide information to affected populations as well as DOE line management. These studies are primarily conducted in partnership with selected State Health Departments under DOE's State Health Agreement program or in conjunction with the Centers for Disease Control and Prevention pursuant to a Memorandum of Understanding with the Department of Health and Human Services.

Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997 Request	$ Change	% Change
International Programs					
- Marshall Islands	$6,800	$6,800	$6,800	0	0%
- Other Programs	3,745	4,017	3,000	-1,017	25%
Occupational Medicine	6,200	6,095	6,000	-95	2%
Epidemiologic Studies	25,022	24,733	22,768	-1,965	8%
Total Health Studies Program	$41,767	$41,645	$38,568	$-3,077	7%

Performance Summary

FY 1995 Accomplishments

- Completed epidemiologic investigations of several worker and community health concerns; continued epidemiologic surveillance of DOE workers at ten sites and published findings in annual epidemiologic surveillance reports; provided briefing and written materials to stakeholders on completed studies.

- In the Marshall Islands, conducted two medical missions providing medical surveillance for over 300 merciless patients and conducted two environmental missions entailing collection and analysis of soil and vegetation samples, environmental half-life and dose reduction mitigation studies at two atolls.

- Completed a Memorandum of Understanding (MOU) with the National Institute for Occupational Safety and Health (NIOSH) in response to the requirements of Section 3162 of the Defense Authorization Act of 1993.

- Initiated grant program through NIOSH to support research and innovation in exposure assessment and medical studies.

- Identified, located, and provided medical examinations to 2,000 current and former DOE employees at risk for chronic beryllium disease and 200 former employees with high lifetime exposures to ionizing radiation.

- Established pilot medical surveillance information system, used by occupational medicine physicians to link clinical findings to working conditions resulting in identification of potential occupational health concerns that are investigated and resolved to protect and improve the health of workers.

- Established new grants program to support research to develop and evaluate surveillance programs that will increase knowledge of workplace hazards and the adverse outcomes of exposure to hazards.

- Initiated pilot studies on populations exposed to radiation following the Chernobyl accident and populations living in the South Ural region of the Russian Federation. Chernobyl-related studies included examination of the incidence of thyroid cancer in children and leukemia and cataracts in cleanup workers.

FY 1996 Accomplishments (to date and planned)

- Continue epidemiologic studies conducted under the MOU with the Department of Health and Human Services.
- Conduct two additional medical missions, two additional environmental missions, and one whole body counting mission in the Marshall Islands.
- Continue epidemiologic surveillance of workforce health and safety, identify emerging health and safety issues requiring evaluation, and initiate epidemiologic studies.
- Provide medical examinations to 1,500 to 2,000 current and former DOE workers at risk for occupational disease, initiate epidemiologic investigations based on findings from epidemiologic surveillance, and enhance communication with workers, community residents, and other stakeholders.
- Complete first phase of U.S.-Russian pilot studies on workers at the Mayak facility and populations living in the South Ural region for incidence of cancer mortality.
- Complete development of medical surveillance information system.
- Continue pilot studies on populations exposed to radiation.

FY 1997 Planned Accomplishments

- Continue two medical missions, two environmental missions, and one whole body counting mission in the Marshall Islands. ($6.8 million)
- Continue U.S.-Russian collaborative efforts to full-scale cohort studies in the South Ural region and begin feasibility studies in other contaminated regions. ($2.7 million)
- Analyze clinical findings of working conditions across multiple sites, and identify and investigate potential occupational health concerns. Provide medical examinations for 2,000 to 3,000 current and former employees at risk for occupational disease at DOE facilities. Plan and implement expanded medical surveillance across DOE sites. ($4.5 million)
- Support commitments under State Health Agreements whereby the Department provides grants to states hosting DOE facilities to determine the impact of operations of those facilities on the health of the surrounding communities. ($5.0 million)

- Continue epidemiological surveillance of DOE workers at ten sites and publish findings in annual epidemiological surveillance reports; provide briefings and written materials to stakeholders on completed studies. ($2.0 million)

- Continue grant program through NIOSH to support research and innovation in exposure assessment and medical studies.($1.5 million)

- Continue epidemiologic studies conducted under the Memorandum of Understanding with the Department of Health and Human Services. ($14.77 million)

- Continue efforts to evaluate biokinetic models for deposition and dosimetry for transuranics in humans to improve models and occupational radiation standards. ($1.0 million)

- Continue United States participation in Project Indalo. ($0.3 million)

Explanation of Funding Changes FY 1996 to FY 1997

- Reduction in epidemiologic studies and State Health Agreements reflects current budget constraints. ($-1.9 million)

- Reduce support for Chernobyl and Russian Federation based on budget constraints. ($-1.0 million)

PROGRAM PERFORMANCE SUMMARY:

Mission Supporting Goals and Objectives

Program Direction provides employees salaries, benefits, travel, and any other personnel benefits to ensure that all operations are conducted in the most efficient; and effective manner consistent with the EH policies.

Performance Summary

FY 1995 Measurable Performance Activities

- Conducted independent oversight evaluations and special studies of the effectiveness of environment, safety, health, and safeguards and security policies and programs across the DOE complex.
- Continued reduction in utilization of contractors, increased reliance on Federal staff.
- Conducted health studies of workforce and community concerns.
- Developed technical qualifications program.

[5]Original Defense appropriations had program direction incorporated in the Other Defense Activities and Weapons Activities. These changes are highlighted in the FY 1996 Comparability Matrix included in the Environment, Safety and Health Executive Budget Summary.

[6]Capital equipment is not incorporated in the weighted FTE average.

23-254 96 – 18

FY 1996 Measurable Performance Activities

- Implement technical qualifications program.
- Continue reduction in contractor utilization.
- Continue to provide the Secretary and DOE managers with an important tool--independent and unbiased view of how well the Department is doing in managing environment, safety, health, and safeguards and security programs.
- Conduct health studies of workforce and community concerns.
- Implement state health agreements.
- Continue to work with line management to eliminate redundant functions.

FY 1997 Planned Accomplishments

- Continue reduction in contractor utilization consistent with strategic alignment initiative.
- Increase safety by identifying areas that require improvement.
- Continue to provide the Secretary and DOE managers with an important tool--independent and unbiased view of how well they are doing in managing environment, safety, health, and safeguards and security.
- Conduct health studies to protect the health of all DOE workers as well as the health of the communities that have hosted DOE sites.
- Continue technical qualification program.

Explanation of Funding Changes FY 1996 to FY 1997

Continue reduction and streamlining of Federal staff. Net reductions are 11 FTEs and $1,060,000.

Explanation of Average FTE Costs

The full time equivalent fully loaded cost includes salaries, benefits (such as employees' retirement, health and life insurance, accident compensation, Federal Insurance Contribution Act taxes, Federal Retirement Thrift Savings Plan and relocation expenses), travel, materials and supplies.

WORKER AND COMMUNITY TRANSITION AND PROGRAM DIRECTION

PROGRAM MISSION

The Office of Worker and Community Transition was formed in September 1994 to assure the fair treatment of workers and communities affected by changing Department of Energy missions primarily through the Worker and Community Transition program in accordance with Section 3161 of the Defense Authorization Act of 1993. This program also provides for the personal and contractual services for all federal management , and administrative personnel to carry out the Worker and Community Transition mission including (related costs such as space , materials , utility , supplies, communication and building maintenance) at DOE Headquarters. Albuquerque, Oak Ridge, Oakland, Richland Operations Offices and Pittsburgh Energy Technology Center.

The GOAL of the Worker and Community Transition program is to:

Mitigate the impacts on workers and communities from contractor work force restructuring at defense sites, and assist community planning for defense conversion, while humanely and cost-effectively managing the transition to the reduced work force that will better meet ongoing mission requirements.

The OBJECTIVES related to this goal are:

1. Restructure the Department Of Energy contractor work force - establish work force restructuring policy, and coordinate, implement and evaluate the outcomes of work force restructuring plans consistent with section 3161 of the National Defense Authorization Act for Fiscal Year 1993, the contract reform initiative and other Departmental policies.

2. Provide benefits to affected workers such as at least 120 days advanced notification, incentives or other options to minimize involuntary layoffs, retraining for environmental cleanup and rehiring preference to displaced workers where practicable, relocation assistance, and outplacement assistance; and provide local community impact assistance.

The OBJECTIVES related to the goal are: (Continued.)

3. Manage contractor labor relations - establish policy for contractor labor relations, oversee the collective bargaining process, and assist field organizations in labor/management relations.

4. Establish and facilitate implementation of a work force planning process - develop a process and tools for projecting contractor work force requirements at each site on the basis of mission, budget estimates, and work force skills.

5. Provide fair treatment to workers who must be displaced throughout the Department, and meet site-specific needs within budget constraints.

6. Assist community transition - develop policies for community transition, and assist communities affected by Departmental changes by facilitating their economic development activities.

PERFORMANCE MEASURES:

1. Number of contractor work force separations accomplished and associated recurring and accumulated cost savings.

2. Percentage of voluntary separations.

3. Number of involuntarily separated workers with hiring preference who are rehired by DOE contractors or subcontractors.

4. The level of satisfaction from displaced workers with benefits and services provided, and their success in securing desired career transition, based on survey results.

5. Success in achieving these reductions while maintaining critical activities through retention of a proper skill mix.

6. Number of collective bargaining agreements successfully completed and successful resolution of labor-management disputes.

7. Number of new jobs, and prospective new jobs, created as a result of economic development activities supported by the program.

8. Stakeholder satisfaction with program based on surveys and other feedback.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS

- The program successfully managed the reduction of over 12,000 contractor personnel between the end of fiscal year 1992 and 1994. From the beginning of FY 1995 to February 1996, over 18,000 prime contractor, and over 3,000 subcontractors, positions have been eliminated in the current fiscal year.

- Over 70% of separations to date have been voluntary, with an average separation cost of approximately $19,000 per position.

- Based on average fully loaded cost per employee, total annual saving to date for the 30,000 prime contractor positions eliminated is in excess of $3 billion.

I. Mission Supporting Goals and Objectives

This activity establishes policy for, coordinates implementation of, and evaluates the outcomes of work force restructuring consistent with section 3161 of the National Defense Authorization Act for Fiscal Year 1993, the contract reform initiative and other Departmental policies. This involves providing guidance to DOE field management for developing work force restructuring plans, assuring adequate advance notification for planned reductions; reviewing and approving voluntary incentive programs to encourage workers with skills excess to ongoing requirements to separate; reviewing draft work force restructuring plans prior to circulation for stakeholder review and comment, approving necessary involuntary separations, and submitting final work force restructuring plans to the Congress. Based on Secretarial direction, work force restructuring plans are developed for any reduction that exceeds a threshold of 100 at any site, including those not specifically covered by section 3161, in a single year. This activity assures that necessary work force reductions are conducted in a manner that encourages voluntary separations, assists displaced workers in securing new employment, and provides basic benefits for a reasonable transition period. The activity makes critical priority decisions to match these objectives with fiscal constraints.

This function assures that contractor work force restructuring is conducted in a manner that assures that critical skills for ongoing mission requirements are retained, enhances efficiency, and accurately forecasts mission performance implications of potential future budget reductions. This goal is being achieved through the development of a uniform work force planning data base for the Departmental contractor employment and an integrated work force planning process. It supports the Departmental objective of realigning efforts to areas of maximum efficiency without jeopardizing critical task assignments.

This function establishes policy for contractor labor relations, oversees the collective bargaining process, and assists field organizations in labor/management relations. These activities promote an improved working relationship between labor and management in the Department's contractor work force. The result is uniform application of relevant labor standards, increased productivity, enhanced safety and security, and a reduction in disruptive labor disputes. The function also helps, to implement the contract reform initiative, outsourcing policy and other elements of strategic alignment.

Section 3161 of the FY 1993 Defense Authorization Act establishes an objective for the Department to "provide local impact assistance to communities that are affected by the restructuring plan" and to coordinate such assistance with other federal programs. In particular, the Department, in close cooperation with parties in the affected communities, seeks to utilize excess Departmental assets to help create economic activity and produce replacement employment for workers displaced by work force restructuring plans. This activity also provides an informational clearinghouse to assist local community economic development planning; identifies potential sources of both public and private funding outside the Department, and on a high priority basis, funds projects that have a high probability of producing positive results for displace workers and their affected communities.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$Changes	% Change
Worker and Community Transition	$119,876	$77,359	$62,659	$-14,700	-19%

III. Performance Summary:

FY 1995 Accomplishments:

- Approved work force restructuring actions resulted in the separation of 14,267 prime contractor and 2,507 subcontractor positions. Prime contractor separations include 2,866 early retirements, 6,832 voluntary separations and 3,010 involuntary separations. Net attrition accounted for an additional reduction of 1,559.

- Coordinated funding support for twenty three final work force restructuring plans at thirteen sites totaling $517 million, which resulted in an average of $19,000 per separated employee since FY 1993.

- Provided $31 million in community transition funding in six communities.

- Approved community transition projects which have created approximately 310 jobs to date, with an additional 700 jobs projected by the end of FY 1996, and 1,900 jobs by the end of FY 1997.

FY 1996 and FY 1997 Accomplishments

- Continued review and approval of work force restructuring actions resulting in over 4,000 contractors separations through February 1996, as well as additional separations through the remainder of the FY.

- Currently forecast budget levels and continued steps to improve the operational effectiveness of the Department indicates that requirement for work force restructuring will occur in FY 1997. The Office is working with Field Operations to define the work force plans to define the level of restructuring required.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
OTHER DEFENSE ACTIVITIES
WORKER AND COMMUNITY TRANSITION
PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities:

Worker and Community Transition (WT) Program Direction budget provides funds for all Federal personnel-related expenses, contractual services, which support Federal staff at Headquarters Office. Program direction provides overall direction and administrative support to ensure that all operations are conducted in the most efficient manner. This program also provides for the personal and contractual services for all federal management, and administrative personnel to carry out the Worker and Community Transition mission including (related cost such as space, materials, utility, supplies, communication and building maintenance) at Department of Energy Headquarters and Field Offices.

The GOAL of Program Direction is to provide a staff that can direct and manage Worker and Community Transition. These staff activities include strategic planning and policy development, integration of internal and external policies and directives, intra and interagency representation, technical direction and guidance of programs and projects, program assessment and internal controls, and management of fiscal and personnel resources in an effective and efficient manner.

552

The OBJECTIVES related to this goal are:

- Provide management, direction, oversight and implementation of Worker and Community Transition.
- Provide highly qualified technical staff to oversee projects and sensitive operational programs.
- Provide staff to carry out our statutory requirements and elective directives.
- Provide professional development and achievement.

554

III. Performance Summary:

Provide salaries, benefits, travel, training, contractual services, and other related costs for Worker and Community Transition Programs' Headquarters Federal employees necessary to meet mission requirements.

FY 1995 Accomplishments:

- Published interim planning guidance on April 5, 1995, for contractor work force restructing and prepared draft out-sourcing and preference in hiring policy which is currently in final review within the Department.

- Coordinated approval of eleven 120 day announcements, nine draft plans, five early retirement programs, thirteen voluntary separation programs, and ten involuntary separation programs.

- Supported and expanded the community college network program to retrain selected site workers for environmental restoration activities and provided field management manual on best out placement practices.

- Held three national stakeholder meetings to review and discuss work force restructuring issues with DOE field management: workers and their interested members of affected communities.

- Provided advice and support for strategic alignment efforts to develop plans to reduce the Department's federal work force.

- Initiated a two-phase process to develop a data base for work force planning. Phase I will incorporate pre-exiting reporting systems and will be implemented by September 1995.

  Established a Work Force Planning Committee including DOE headquarters offices, field offices, labor unions and contractor representatives and other stakeholder to identify data elements necessary to project future work force needs, and contracted with recognized national leaders in the area of performance metrics to establish quantitative measurement criteria.

- Reviewed objectives and parameters of contract negotiations for reasonable costs and compliance with labor policy and section 3161 at Savannah River, Mound, Argonne, Albuquerque and Los Alamos.

FY 1995 Accomplishments (Continued)

- Used oversight and intervention forestalled more serious conflicts in labor and management relations at Rocky Flats, Savannah River, Richland, Mound Argonne, Los Alamos and Fernald.
- Improved data bases and update tracking for labor settlements, bargaining calendar, and census recording to prepare for collective bargaining.
- Established an outreach process including community transition training programs for Department employees, monthly teleconferences, and published information on federal resources.
- Created process improvement teams to resolve barriers to procurement and financial assistance and to revise personal property guidelines.
- Accomplished asset reuse and saved landlord costs at Rocky Flats, Mound leases ($240,000 annual savings), sale of Pinellas Plant, ($37-52 million total savings), Nevada Test Site and Savannah River.
- Developed and maintained participation in other Departmental programs related to the community transition mission.

FY 1996 and FY 1997 Accomplishments:

- Published in the Federal Register revised in Interim Planning Guidance for Contractor Workforce Restructuring.
- Submitted to Congress Report on Work Force Restructuring Plans Completed during FY 1993 and FY 1994.
- Implement Phase II of the work force planning data base that will intergate the results of the planning process established by the Work Force Planning Committee and a comprehensive interactive data base of all contractor employment, including subcontractor workers and those involved in outsourcing, which is not currently available in any coherent form.
- Provide guidance, and assist DOE field management and contractors to incorporate the comprehensive work force planning system into all future work force restricting plans.
- Provided guidance for development, and competitive evaluation of community transition grant request.

FY 1996 and FY 1997 Accomplishments: (Continued)

- Continue oversight of collective bargaining process and assistance to field organization in labor/management relations, with particular focus on contract reform initiative, implementation of outsourcing policy and other elements of strategic alignment.
- Reviewed objectives and parameters of contract negotiations for reasonable costs and compliance with labor policy and section 3161 at Savannah River, Mound, Argonne, Albuquerque and Los Alamos.
- Improved data bases and update tracking for labor settlements, bargaining calendar, and census recording to prepare for collective bargaining.
- Promote large scale private sector reuse of real and personal property no longer needed by the Department.
- Provide expert economic development technical assistance to all interested communities participating in the program.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

Salaries and benefits remained the same from FY 1996 and FY 1997. This is due to the same number of Full Time Equivalent in both years.

V. Explanation of Average FTE Costs:

FY 1997 is the first year for a Program Direction Decision Unit for the Office of Worker and Community Transition. The fully loaded cost per FTE is is approximately $270,000. However, exclusion of support services contractor dollars reduces that cost to approximately $146,000 per Federal FTE.

The department is completing a major restructuring and contractor employment is expected to level out.

FISSILE MATERIALS DISPOSITION

PROGRAM MISSION

In the aftermath of the Cold War, significant quantities of weapons-usable fissile materials (primarily plutonium and highly enriched uranium) have become surplus to national defense needs both in the United States and Russia. In September 1993, the President announced a Nonproliferation and Export Control Policy which commits the United States to undertake a comprehensive approach to the growing accumulation of fissile material from dismantled nuclear weapons. In October 1994, the Secretary of Energy and the Congress took action to create a permanent Office of Fissile Materials Disposition to focus on this important national security mission -- long-term storage of all weapons-usable fissile materials and the disposition of surplus fissile materials. The Fissile Materials Disposition Program is responsible for the Department's technical and management activities to provide for the safe, secure, environmentally sound future long-term storage of all weapons-usable fissile materials and the disposition of fissile materials declared surplus to national defense needs. In March 1995, the President declared 200 metric tons (mt) of fissile material to be surplus to U.S. defense needs. The efforts undertaken by the Office of Fissile Materials Disposition will result in defining and implementing a path forward for the storage and disposition of these surplus fissile materials. The Program's efforts will provide the President the basis and flexibility to initiate implementation of plutonium disposition efforts either multilaterally or bilaterally through negotiations, or unilaterally as an example to Russia and other nations. The success of these efforts will directly contribute to enhancing cooperation with Russia and attaining reciprocal actions on the disposition of Russian plutonium.

The Program is completing technical, schedule, and cost analyses as well as environmental analyses, as required by the National Environmental Policy Act, to provide the basis for building public and political consensus and for making and implementing decisions on the long-term storage and disposition of surplus plutonium and highly enriched uranium. Early program efforts have resulted in narrowing down the list of technical alternatives for plutonium disposition in order to save time and money and position the U.S. to get on with the job of fissile materials disposition. The work in FY 1996 includes demonstrating the technology and systems for disassembling nuclear weapon pits in a near "zero-waste" manner and converting the plutonium to unclassified forms which are required for disposition technologies. Also in FY 1996, research and lab tests are planned for mixed-oxide fuel pellets from weapons plutonium as well as immobilization technology alternatives. Joint technical studies including technology demonstrations on options for plutonium disposition will continue with Russian counterparts.

Unlike plutonium, surplus U.S. highly enriched uranium can be rendered non-weapons-usable by blending it down to low enriched uranium for use in commercial reactor fuel. This is the most rapid path for neutralizing the proliferation threat and is consistent with the course of action now underway in Russia to reduce highly enriched uranium stockpiles. The Program's efforts in FY 1996 will focus on completing the required environmental analyses and identifying and implementing arrangements for the down-blending of the surplus highly enriched uranium materials. Throughout this process, private sector industrial capability will be utilized to the maximum extent practical to help assure a sound and cost effective infrastructure to accommodate increased quantities of

surplus highly enriched uranium over time. Involvement of the private sector facilitated prompt action in efforts to initiate down-blending of the 600kg of highly enriched uranium which the U.S. obtained from the Government of Kazakhstan under Project Sapphire in 1995. Progress in the efforts to disposition the surplus highly enriched uranium, by down-blending it with other surplus uranium materials to commercially useable low enriched uranium, will advance our nonproliferation goals while reducing storage and security costs and providing revenues to the Treasury from the commercial sale of these surplus assets.

In FY 1997, efforts will be directed toward completing the plutonium pit disassembly and conversion demonstration and toward beginning the design of a full scale, integrated, pit disassembly and plutonium conversion system. Efforts will also include beginning the design phase for site-specific long-term storage configurations for the Department's inventory of weapons-usable fissile materials and for tests and research demonstrations of vitrification and mixed oxide fuel technologies. These efforts will directly contribute to advancing U.S. and international nonproliferation interests and to improving the cost-effectiveness of the Department's management of stockpiles of surplus fissile materials. The specific goals, objectives, and performance measures for the Program follow.

The GOAL of the Fissile Materials Disposition Program is to:

Contribute to a reduction in the global nuclear danger associated with inventories of surplus weapons-usable fissile materials by developing strategies and directing actions to provide safe, secure, economic and inspectable long-term storage of U.S. weapons-usable fissile materials and to eliminate surplus materials through disposition in a manner that encourages cooperation and reciprocal action abroad.

The OBJECTIVES related to this goal are:

1. To Provide A Cost-Effective, Safe, Secure, Environmentally Sound and Inspectable Long-term Storage Configuration For The Department's Weapons-Usable Fissile Materials - Prepare the engineering, design, cost, schedule, and environmental analyses necessary to make and implement decisions on the future storage of the Department's inventory of weapons-usable fissile materials.

2. To Eliminate The Stockpile Of Surplus Weapons-Usable Uranium - Prepare the necessary engineering, design, cost, schedule, and environmental analyses to make and implement decisions regarding the verifiable disposition of surplus uranium. Take advantage of successful disposition arrangements by coordinating actions across Program lines. Where practical, utilize private sector industrial capabilities to process and disposition surplus uranium, thereby developing the infrastructure to accommodate increased quantities of surplus uranium over time. Generate revenues for the U.S. Treasury from the disposition of surplus uranium.

3. To Eliminate The Stockpile Of Surplus Weapons-Usable Plutonium - Demonstrate the early feasibility of a process for the verifiable disassembly, extraction, and conversion of plutonium from weapons components into forms suitable as feed for disposition technologies and/or storage, with an emphasis on pollution prevention. Prepare the necessary engineering, design, cost, schedule, and environmental analyses to enable decisions regarding the disposition of surplus weapons-usable plutonium. Maximize the use of existing facilities for disposition activities to the extent practicable. Disposition surplus weapons-usable plutonium to the spent fuel standard so that the plutonium is converted to a form that is as unattractive and as difficult to use in a nuclear weapon as the residual plutonium in commercial spent fuel.

Program Mission: FISSILE MATERIALS DISPOSITION

4 To Provide A Technical And Program Infrastructure To Enable The United States To Take Unilateral Action To Successfully Negotiate Reciprocal Actions With Other Nations For The Verifiable Disposition Of Surplus Weapons-Usable Plutonium - Continue Joint U.S. Russian Study on the disposition of plutonium to give the President the basis and flexibility to initiate disposition efforts either multilaterally or bilaterally through negotiations or unilaterally as an example to other nations. Demonstrate the feasibility of an integrated process and technologies that could be used by the U.S. and Russia for disassembly and verifiable extraction and conversion of plutonium from weapons components into forms suitable for long-term storage and disposition. Continue tests and experiments to validate disposition technology options under consideration prior to implementation.

PERFORMANCE MEASURES

Future Storage

- Complete engineering and conceptual designs, as well as schedule, and cost analyses for long-term storage of fissile materials across Departmental operations (FY 1996)
- Complete National Environmental Policy Act (NEPA) analyses and associated Records of Decision (ROD) for future long-term storage alternatives for all fissile materials (Late 1996)
- Start site-specific design(s) of a future storage facility(s)/or upgrades following ROD (FY 1997)
- Begin site-specific EIS for long-term storage facility decisions following the ROD (FY 1997)

Highly Enriched Uranium Disposition

- Complete schedule and cost studies for highly enriched uranium (HEU) disposition alternatives (FY 1996)
- Complete NEPA analyses and associated ROD for HEU disposition alternatives (FY 1996)
- Blend-down Project Sapphire HEU to low enriched uranium (LEU) for peaceful use as commercial reactor fuel (FY 1996)
- Begin conversion of quantities of surplus HEU and other uranium materials resulting from clean-up activities at weapons sites to non-weapons-usable forms through sale and/or disposition, maximizing reliance on private sector capabilities for blend-down (FY 1996 and outyears)

Plutonium Disposition

- Complete engineering, conceptual design, schedule, and cost studies for plutonium disposition alternatives (FY 1996/FY 1997)

560

Program Mission: FISSILE MATERIALS DISPOSITION

- Complete NEPA analyses and associated RODs for disposition alternatives (FY 1996/FY 1997)
- Demonstrate an integrated system for verifiable pit disassembly and plutonium extraction and conversion for long-term storage and future disposition (FY 1997)
- Begin conceptual design for a pit disassembly and conversion facility (FY 1997)
- Characterize the mechanics of gallium evolution from mixed oxide fuel (MOX) and make determination of gallium on MOX fuel quality (FY 1996)
- Conduct MOX fuel pellet demonstrations (FY 1996/FY 1997)
- Demonstrate feasibility of utilizing can-in-can concept for vitrification technology (FY 1996/FY 1997)
- Minimize costs for implementation of immobilization option by leveraging off of available Departmental experience and facilities (FY 1996/FY 1997)
- Formulate glass and ceramics to incorporate plutonium, neutron poisons, and radiological barriers to meet processing and long-term performance requirements of immobilization disposition alternatives (FY 1997)
- Begin site-specific environmental analyses for a pit disassembly and conversion facility (FY 1997)

Cooperation and Reciprocity With Other Nations

- Conduct joint technical studies and demonstrations with Russian counterparts on options for plutonium disposition (FY 1996/FY 1997)
- Collaborate on technologies and processes for disassembly and conversion of weapons plutonium components to feed forms for disposition and long-term storage (FY 1996/FY 1997)

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS (to date):

- Completed an Environmental Assessment (EA) on the disposition of the Kazakhstan origin HEU materials and coordinated with USEC and U.S. industry to implement actions to down-blend the surplus, weapons-usable HEU for use in commercial reactor fuel.
- Prepared a draft EIS for the disposition of surplus HEU (a separate action was determined the most rapid path for neutralizing the proliferation threat

of surplus HEU).

- Increased revenue potential from privatization of USEC by arranging for the transfer of HEU and other surplus uranium to USEC for future blend-down and sale for use in commercial reactor fuel.
- Initiated demonstration of the Advanced Recovery and Integrated Extraction System (ARIES) process for disassembling nuclear weapon pits and converting the plutonium to unclassified forms suitable for long-term storage and/or disposition options.
- Prepared a draft PEIS on the future storage of fissile materials and the disposition of the surplus weapons-usable plutonium. Narrowed disposition technology options to focus the evaluation in the PEIS to save time and money in getting on with the job of surplus fissile material disposition.
- Conducted environmental, technical, cost, and schedule analyses to enable a decision on alternatives for fissile materials storage and disposition.
- Completed conceptual designs for a consolidated long-term storage facility and upgrade options.
- Completed validation of the hydride/dehydride process for pit conversion.
- Initiated a test of the feasibility of utilizing the "can-in-can" concept for vitrification at the Department's Defense Waste Processing Facility (DWPF).
- Initiated joint study with the Russians on plutonium disposition options and developed options for joint small scale technology demonstrations.

FISSILE MATERIALS DISPOSITION

I. Mission Supporting Goals and Objectives

The Fissile Materials Disposition Program is responsible for technical and management activities to provide for the safe, secure, environmentally sound, long-term storage of all weapons-usable fissile materials and the disposition of fissile materials declared surplus to national defense needs. Analyses being conducted include engineering, design, cost, schedule and environmental characteristics of each alternative being considered in order to support a decision process resulting in a ROD. RODs are planned for the second quarter of 1996 for HEU disposition and late 1996 for the long-term storage of all fissile materials and disposition of surplus fissile materials.

This budget request precedes upcoming programmatic decisions that will define the scope of the specific long-term storage and disposition activities. As a result, funds requested for implementation of HEU disposition were based upon the Department's preferred alternative documented in the EIS Implementation Plan. Funds requested for implementation of long-term storage decisions and plutonium disposition decisions were based upon a set of assumptions for expected first year's expenditures for alternatives under consideration. Alternatives are:

- Storage alternatives for all weapons-usable fissile materials include: (1) continued storage in existing facilities (no action alternative required under NEPA), (2) upgrade of current storage facilities; and (3) consolidation at DOE sites(s).

- Disposition alternatives for HEU and other uranium materials include: (1) continued storage as HEU, (2) blend-down to LEU for use in commercial reactors, and (3) blend-down and disposal as waste. The Department has identified a preferred alternative comprised of the following: (1) transfer approximately 50 metric tons of HEU to USEC over the next several years for blend-down and use in commercial reactor fuel, (2) sell additional quantities of surplus HEU or LEU from blended-down HEU for use in commercial reactor fuel, and (3) continue storage of blended-down surplus HEU that has no commercial value pending final disposal.

- Technology alternatives for the disposition of surplus weapons plutonium fall into three categories:

  - Nuclear Reactors/MOX fuel - surplus plutonium would be fabricated into MOX fuel for use in existing, modified, or new nuclear reactors that would consume (fission) some of the plutonium and embed the rest in highly radioactive spent fuel similar to that now produced by commercial power reactors. The spent fuel would subsequently be stored and ultimately disposed of in a geologic repository. Reactor options evaluated include: existing light water reactors (LWRs); partially completed LWRs; new evolutionary or advanced LWRs; and Canadian Deuterium Uranium (CANDU) reactors.

  - Immobilization - surplus plutonium would be vitrified or embedded in ceramic or other material, either alone or mixed with radioactive high-level wastes, to form glass or ceramic for ultimate disposal in a geologic repository. Technical options under consideration include: new borosilicate glass vitrification facility; new ceramic immobilization facility, use of the existing DWPF ("can-in-can"), and electrometallurgical treatment at an existing facility.

  - Geologic Disposal - surplus plutonium, in an acceptable form, would be placed in canisters either with or without added radiation barriers, and

buried in deep boreholes drilled into the earth.

Options for dealing with surplus weapons-usable plutonium disposition are diverse, complex, and require substantial analyses to address environmental, technical, cost, nonproliferation policy, and regulatory issues. Technical efforts and analyses required for the decision process will provide a foundation for selecting technology alternatives at ROD.

Other disposition-related activities include:

- Demonstration of hydride/dehydride technology as part of an integrated system for disassembling nuclear weapon pits and converting plutonium to unclassified forms required for any disposition option selected in the ROD. The integrated process would convert classified weapon shapes and geometries into forms suitable for long-term storage or disposition. The process can facilitate inspections as part of future arms control regimes that require verification of weapon dismantlement and/or material disposition.

- Completion of a joint study with Russian counterparts on plutonium disposition options and implementing options for small scale technology demonstrations.

II. Funding Schedule: (dollars in thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Storage Options	$ 5,184	$ 6,780	$ 24,600	$ 17,820	% 262.8
Disposition Options	18,594	21,150	31,760	10,610	50.2
Technical Integration, Support & Associated Technologies	13,259	29,407	27,453	-1,954	-6.6
NEPA Compliance	11,783	9,350	6,350	-3,000	-32.1
Total a/	$ 48,820	$ 66,687	$ 90,163	$ 23,476	% 35.2

a/ FY 1995 excludes $7,295 prior year balances and $6,604 NE funds for Reactor Disposition Options.

III. Performance Summary:

Performance Summary: FISSILE MATERIALS DISPOSITION

FY 1995 Accomplishments

- Issued Notice of Intent, conducted public scoping, and issued Implementation Plans associated with the EIS and PEIS for long-term storage and disposition alternatives.
- Completed an EA on the disposition of the Kazakhstan origin HEU materials (Project Sapphire) and shipped materials to an industrial firm to blend the material to LEU suitable for use in commercial reactor fuel.
- Prepared an EIS for the disposition of surplus HEU (a separate action was determined the most appropriate, rapid path for decisions on surplus HEU disposition).
- Developed cost effective methods with USEC and U.S. industry to disposition surplus HEU in a safe, secure, and environmentally sound manner.
- Generated revenues by arranging for the transfer of 50 mt of HEU plus other surplus uranium to USEC for blend-down and future sale for use in commercial reactor fuel resulting in significant financial returns to the Treasury in FY 1996.
- Initiated demonstration of an integrated process for disassembling nuclear weapon pits and converting the plutonium to unclassified forms suitable for long-term storage and/or disposition.
- Initiated preparation of a PEIS on the future storage of fissile materials and the disposition of the surplus weapons-usable plutonium. Narrowed down the number of disposition technology options significantly to focus the evaluation in the PEIS and save time and money in getting on with the job of surplus fissile materials disposition.
- Conducted required environmental, technical, cost, and schedule analyses to enable a decision on alternatives for fissile materials storage and disposition. Completed approximately 40 technical studies/reports. Additional essential studies/reports are underway and will be completed in FY 1996.
- Completed preconceptual designs for a consolidated long-term storage facility and upgrade options.
- Completed initial research and development on the morphology of MOX fuel pellets from weapons grade plutonium.
- Completed validation of the hydride/dehydride process for plutonium pit conversion to metal ingot forms.
- Demonstrated that cesium and plutonium can be incorporated in ceramic formulation.
- Initiated a test of the feasibility of utilizing the "can-in-can" concept for vitrification at the Department's DWPF.

Performance Summary: FISSILE MATERIALS DISPOSITION

- Initiated licensing discussions with NRC on all alternatives.
- Initiated joint study with the Russians on plutonium disposition options and developed options for joint small scale technology demonstrations.

FY 1996 Accomplishments (to date and planned):

- Complete environmental, schedule and cost studies for HEU disposition.
- Select disposition alternatives for HEU (second quarter of FY 1996).
- Provide for the transfer of 50mt of surplus HEU and other surplus uranium materials to USEC for blenddown and use in commercial reactor fuel over the next several years.
- Develop and execute industrial arrangements for blend-down and commercial sale of additional quantities of surplus HEU and other uranium materials, including materials from weapons site cleanup activities.
- Blend-down Project Sapphire HEU to LEU for peaceful use as commercial reactor fuel.
- Complete design and initiate certification of shipping containers for HEU.
- Complete environmental, technical, cost and schedule analyses to enable a decision on alternatives for fissile materials future storage and disposition.
- Completed conceptual designs for a consolidated long-term storage facility and upgrade options.
- Completed a Conceptual Design Report for a non site-specific consolidated long-term storage facility.
- Initiate a multi-program coordination effort on storage designs, material forms and containers to ensure consistency across DOE complex.
- Publish a draft and final PEIS for the future storage of all fissile materials and disposition of fissile materials declared surplus to national defense needs.
  - ? Select alternatives and site(s) for future storage actions-- at ROD after final PEIS (late 1996).
  - ? Select disposition technologies for surplus plutonium -- at ROD after final PEIS (late 1996).

Performance Summary: FISSILE MATERIALS DISPOSITION

- Demonstrate integrated system for extraction and conversion process for plutonium materials to forms suitable for disposition (ARIES). Facility includes decontamination/preparation of existing room and installation of gloveboxes and associated process support equipment.
- Demonstrate feasibility of utilizing can-in-can concept at the DWPF for vitrification disposition.
- Characterize the mechanics of gallium evolution from MOX fuel and determine the effect of gallium on MOX fuel quality.
- Formulate glass and ceramics to incorporate weapons plutonium, neutron poisons and radiological barriers to meet processing and long-term performance requirements of immobilization disposition alternatives.
- Complete the U.S./Russian Joint Study and conduct technical demonstrations in order to provide U.S. and Russian decision makers a set of consistently evaluated plutonium disposition alternatives to form a mutual foundation for equivalent plutonium disposition actions.

FY 1997 Planned Accomplishments:

- Disposition surplus HEU and other surplus uranium materials.
- Begin Title I design of site-specific storage facility(s) following the ROD.
- Continue research and development tests and experiments of immobilization and MOX fuel technologies.
- Complete testing of an integrated system for disassembly and conversion of weapons plutonium pits into forms suitable for long-term storage and disposition and begin conceptual design for an operational plant.
- Continue technical collaboration with Russia including cooperation in tests and research.
- Begin project-specific EAs or EISs associated with future storage and disposition decisions following the ROD as required by NEPA.

Explanation of Funding Changes FY 1996 to FY 1997:

The increases reflect the progress in the Program efforts as it moves from analyses and technical studies to decisions and implementation:

- Storage Options - the net increase of $17,820,000 is primarily due to Title I design of a site-specific long-term storage facility(s) option(s) selected in the ROD and research and development associated with the operational aspects of the facility(s).
- Disposition Options - the net increase of $10,610,000 is due to research and development and testing of disposition alternatives to validate options

570

prior to implementation, partially offset by completion of direct geologic and repository impact evaluations required to support the ROD.

- Technical Integration, Support & Associated Technologies - the net decrease of $1,954,000 is primarily due to completion of common technologies evaluations and analyses required to support the ROD and completion of the ARIES demonstration. Beginning conceptual design of a pit disassembly and conversion facility and research and development associated with the conversion of nonpits is also included here.

- NEPA Compliance - the decrease of $3,000,000 is due to the completion of the EIS for HEU disposition and the PEIS for long-term storage of all weapons-usable fissile materials and plutonium disposition. The EIS and PEIS documentation will serve as the basis for EAs or EISs associated with implementation of site-specific future storage and disposition options selected in the ROD.

FISSILE MATERIALS DISPOSITION PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities

Program direction provides overall management, oversight, staffing, and administrative support necessary to carry out the mission of the Fissile Materials Disposition program. Operations are conducted in an efficient and streamlined manner consistent with National Performance Review objectives and Departmental strategic alignment initiatives. Program direction has been grouped into four categories.

Salaries and Benefits provides for Federal personnel compensation to include SES and other awards, overtime, lump sum leave payments, transit subsidy costs, and employer's contribution to employees' benefits.

Travel includes domestic and foreign trips necessary to conduct business in carrying out the mission of the program. International travel is frequent in that Fissile Materials Disposition serves as the Department's representative on the Joint U.S. Russian Study on plutonium disposition options.

Support Services include program analyses and office operations functions which result in improving the effectiveness, efficiency, and economy of management and general administrative services.

Other Related Expenses include employee training, interpreter services, rental space, telecommunications, utilities and miscellaneous charges, printing and reproduction, operation and maintenance of equipment, supplies and materials, and other miscellaneous expenses associated with office operations.

II. Funding Table: (dollars in thousands)

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request

Average	$ 130	$ 157	$	$ 171	173

III. Performance Summary:

Performance Summary: FISSILE MATERIALS DISPOSITION

FY 1995 Measurable Performance Activities:

- Lead effort to successfully ship Kazakhstan origin HEU materials to an industrial firm for blend-down.
- Directed technical, cost, schedule, and environmental analyses efforts in support of future decisions on long-term storage and HEU and plutonium disposition.
- Directed efforts toward completion of preconceptual designs for a consolidated long-term storage facility(s) and upgrade options.
- Developed and coordinated plans to begin demonstrations and tests of ARIES and disposition options under consideration.
- Represented the Department in working with the Russians to initiate a Joint US-Russian Study on plutonium disposition options.

FY 1996 Measurable Performance Activities:

- Initiate teaming effort with other DOE programs to coordinate future departmental storage decisions.
- Direct and oversee efforts to ensure technical, cost, schedule, and environmental analyses are completed to provide information necessary to make decisions on long-term storage and HEU and plutonium disposition.
- Direct and oversee the start of the testing of the ARIES system.
- Direct and oversee the research and development and testing of disposition options necessary for implementation.
- Work with USEC and the commercial sector to disposition HEU and other surplus uranium materials.
- Represent the Department in working with the Russians to complete the Joint US-Russian Study on plutonium disposition options.

FY 1997 Measurable Performance Activities:

- Work with USEC and the commercial sector to disposition HEU and other surplus uranium materials.
- Award and manage activities to complete Title I design of site-specific storage facility(s).
- Direct and oversee the completion of the testing of the ARIES system and award and manage conceptual design activities for the pit disassembly and conversion facility.

574

Performance Summary: FISSILE MATERIALS DISPOSITION

- Direct and oversee the research and development and testing of disposition options necessary for implementation.
- Award and manage activities to begin work on project-specific EAs or EISs for future storage and disposition decisions.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

Program Direction - the net increase of $51,000 is for salary adjustments in accordance with allowable inflation factors. This also reflects a decrease in support service contracts.

V. Explanation of Average FTE Costs:

Average FTE costs include travel, support services, other related expenses., and the program's fair share of the Department's Working Capital Fund. FY 1995 average FTE costs exclude salaries and benefits as FTEs were funded by originating line organizations.

FISSILE MATERIALS DISPOSITION

1. Title and Location of Project:	Consolidated Special Nuclear Materials Storage Facility Design Only - Site to be Determined at Record of Decision (late 1996)	2a. Project No. 97-D-140 2b. Construction Funded
3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY97 3b. A-E Work (Titles I & II) Duration: 36 months		5. Previous Cost Estimate: none
4a. Date Physical Construction Starts: FY 1999 4b. Date Construction Ends: FY 2002		6. Current Cost Estimate:$17,000 (Design Only) Total Estimated Cost: TBD Total Project Cost: TBD

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$17,000	$0	$17,000	$10,200

FY 1998-Beyond - TBD

This budget request precedes upcoming programmatic decisions that will define the scope of the specific long-term storage activities. As a result, funds requested for implementation of long-term storage decisions were based upon a set of assumptions for expected first year's expenditures for alternatives under consideration. Alternatives for future long-term storage of all weapons-usable fissile materials include: (1) continued storage in existing facilities (no action alternative required under NEPA); (2) upgrade of current storage facilities; and (3) consolidation at DOE site(s). The Department expects to complete and issue a Record of Decision (ROD) on the long-term storage of plutonium by late 1996. As the ROD is developed, the Office of Fissile Materials Disposition will coordinate with other DOE programs to integrate storage plans and capabilities to optimize use of existing facilities and minimize costs. The Title I funding would not preclude or prejudice any final ROD, rather it would help assure that construction funding is available to support prompt implementation of Title I design following the ROD. This initial design effort could be applied either at Savannah River (a candidate site for the consolidated facility, or a new Actinide Packaging and Storage Facility) or at another candidate site.

8. Project Description, Justification, and Scope

Since this request precedes the Record of Decision (late 1996), Title I design funding is requested in terms of a consolidated storage facility, however, funding could be used for any alternative selected.

This project provides for new construction for the safe, secure, consolidated storage of surplus and strategic plutonium materials that exist at DOE sites. The project results in a Consolidated Special Nuclear Materials Storage Facility at an existing DOE site, thereby using the existing balance of plant facilities to make the storage plant fully operational. Funding is required to provide for the new construction and to upgrade the existing balance of plant facilities for the storage facility.

The Consolidated Special Nuclear Materials Storage Facility includes a new, secure, safety class hardened material handling area, material storage area and a non-safety class support area. The material handling area provides for Safe Secure Transport loading/unloading, cargo restraint transporter handling, material confirmation, shipping package staging, unpackaging/packaging, accountability measurement, repackaging, maintenance, and satellite waste collection. The material storage area is modular in design and includes the passively cooled surplus and strategic reserve storage vaults and a safety evaluation area; an international inspection area is provided for the surplus material vaults. The support area includes change rooms, office area, the central control room, the waste packaging area, and the analytical laboratory. The storage plant includes automated storage and retrieval equipment in the material handling area and the material storage area.

The justification for this project is :

1. Currently the Department's plutonium inventory is located at numerous sites across the DOE complex which are not suitable for the long-term storage of plutonium.

2. Consolidation of materials would save money by reducing security and safeguards costs and other facility operation costs.

3. Increased use of automation would reduce radiation exposure to plant personnel.

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		TBD
1. Engineering design and inspection at approximately 17.6 percent of construction costs, Item c (Design, Drawings, and Specifications)		
2. Construction Management Costs		
3. Project management @ 5% of construction costs (Item c)		
b. Land and land rights		0
c. Construction costs		TBD
1. Improvements to land		
2. Buildings		
3. Other structures		
4. Utilities		
5. Special Facilities		
d. Standard Equipment		TBD
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a. through g.)		TBD
i. Contingencies at approximately 30 percent of above costs		TBD
j. Total line item cost (Section 12, a. 1. (a))		TBD
Less Federal Contribution		0
l. Net Federal total estimated cost (TEC)		TBD

10. Method of Performance

Method of performance will be through competitive selection of an A&E firm for design (Title I/II/III) and a construction firm. To the extent feasible, procurement will be accomplished by fixed price contracts.

580

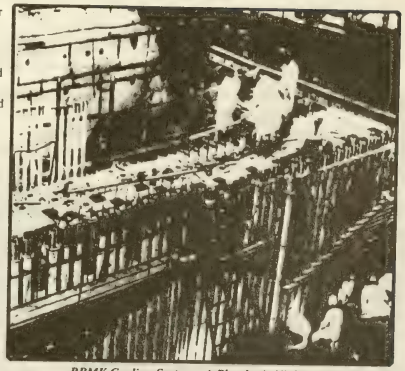
INTERNATIONAL NUCLEAR SAFETY AND CHORNOBYL INITIATIVE

PROGRAM MISSION

The International Nuclear Safety and Chornobyl Initiative program is designed to reduce the national security and environmental threats posed by the operation of unsafe and aging nuclear facilities around the world. Particular attention is paid to improving the safety of Soviet-designed nuclear power plants and to shutdown of the Chornobyl plant, site of the world's worst nuclear disaster. The program helps maintain core competencies in nuclear safety through the establishment of international nuclear safety centers in the U.S. and elsewhere, and through cooperative research and development with other countries and international organizations. These activities are conducted consistent with guidance and policies established by the U.S. Department of State, the Agency for International Development, and the Nuclear Regulatory Commission.



RBMK Cooling System - A Plumber's Nightmare

The GOALS of the International Nuclear Safety and Chornobyl Initiative program are to:

1. Improve nuclear safety worldwide, particularly the safety of Soviet-designed nuclear power plants.

2. Secure shutdown of the Chornobyl nuclear power plant.

3. Develop and maintain core competencies in the area of nuclear safety.

The OBJECTIVES related to these goals are:

1. To enhance the safety of Soviet-designed nuclear power plants and help host countries upgrade their nuclear safety cultures and supporting infrastructures through installation of equipment and development of methods which will improve the safety of operations; transfer technologies needed to reduce risk of reactor operations; incorporate the owners and operators of Soviet-designed nuclear power plants as full partners in the global nuclear industry; cultivate a more robust attitude towards nuclear safety; enhance indigenous capabilities to evaluate safety and make decisions about shutdown; and create opportunities for U.S. industries in the host countries.

The OBJECTIVES related to these goals are: - continued

2. Assist in the shutdown of the Chornobyl reactors.

3. Support international nuclear safety centers in the U.S. and elsewhere.

4. Initiate nuclear safety dialogues with emerging nuclear nations.

5. Provide technical leadership in international nuclear organizations.

6. Facilitate and increase commercial contacts between U.S. nuclear suppliers and potential foreign buyers.

PERFORMANCE MEASURES:

Demonstrated success is a key element of the International Nuclear Safety and Chornobyl Initiative program. Overall program measures of success include the following:

1. Development of and agreement on program goals, objectives, and strategic plans between the U.S. and the host countries;

2. Involvement of plant operators, plant technical support, and regulators in program planning and execution;

3. Agreement among interested parties in the U.S. and host countries on safety problems and priorities;

4. Evidence of the host country making independent decisions regarding safety upgrades, operation, and shutdown in light of safety concerns;

5. Measurable improvements in plant operational and operator performance;

6. Successful operation of international nuclear safety centers in Russia and Ukraine;

7. Development of comprehensive decommissioning and decontamination plans for the Chornobyl nuclear power plant in anticipation of shutdown; and

8. Participation in three to five nuclear export-related missions, workshops, or seminars to promote U.S. vision on nuclear safety.

Molten debris mass containing a few percent fuel:
After the Chornobyl-4 accident, the reactor core melted and flowed through vapor suppression pipes to the suppression pool volume under the reactor vault

584

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Established training centers in Russia and Ukraine and completed the development of pilot training courses.
- Provided basic fire protection equipment to pilot plants in Russia and Ukraine. Developed a fire hazards evaluation methodology for use on Soviet-designed power plants.
- Initiated the acquisition and the transfer of technology for a full-scope VVER-1000 plant simulator along with several analytical simulators and plant analyzers, a spent fuel storage capability, and Safety Panel Display Systems for six RBMK reactors.
- Implementing U.S. style symptom-based emergency operating instructions and conduct of operations guidance at pilot plants.
- Completed specifications and contracting for the following safety system improvements at pilot plants in Russia: improved confinement leak tightness and reliable emergency DC power supply at the Kola plant; a Safety Panel Display System at the Novovoronez plant; and a reliable emergency DC power supply, emergency core cooling water system, and ultra sonic inspection system at the Kursk plant.
- Provided upgraded fire-fighting equipment to the Koyloduy plant site.
- Provided plant analyzers and on-site training in Bulgaria and Lithuania.
- Began cooperative projects among U.S., Russian, and Ukrainian international safety centers supported by U.S. national laboratories.
- Participated in four nuclear export and safety-related missions, workshops, or seminars.

I. Mission Supporting Goals and Objectives

This activity has five elements that are critical to achieving lasting improvements in nuclear safety culture and infrastructure development. First, the program is working to improve the capabilities of nuclear power plant operators to establish sound operational procedures, and to develop methods for responding to operational abnormalities. Second, the program seeks to improve the physical condition of the plants, particularly their safety systems. Third, the program provides professionals involved in the design, operation, and regulation of nuclear power plants with the techniques and expertise required to conduct safety analyses that are consistent with Western practices. The fourth element is assistance to host countries in developing the domestic liability legislation needed to enable a broader involvement of U.S. private industry and establish a strong, independent regulatory authority. Additionally, some of the above activities will also be provided to Soviet-designed reactors in Central and Eastern European countries.

The International Nuclear Safety and Chornobyl Initiative helps to maintain core competencies in nuclear safety through its support for international nuclear safety centers, which undertake cooperative research and development programs, information exchanges, computer modeling, and other activities. One such center is being established in Ukraine to address some of the problems associated with Chornobyl shutdown; in addition, the program is assisting with short-term upgrades at Chornobyl to ensure safety for the remainder of its operating lifetime.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Management & Operational Safety Improvements	$ 13,862	5,200	$ 14,900	$ 9,700	187

III. Performance Summary

FY 1995 Accomplishments:

- Established training centers in Russia and Ukraine and completed the development of 50 percent of the planned training courses.
- Implemented improvements to the confinement and emergency DC power supply of two units at Kola.
- Provided fire protection equipment and materials to a plant in Russia and to a plant in the Ukraine.
- Completed the risk management program for the Dukovany nuclear power plant in the Czech Republic.
- Provided equipment for training center and delivered 1100 kilowatts backup diesel generator for the Kozloduy nuclear power plant in Bulgaria.
- Completed baseline probabalistic risk assessment per review at Ignalina nuclear power plant in Lithuania.
- Initiated implementation of Ukraine Safety and Environmental Research and Development Center support by U.S. national laboratories.
- Participated in four nuclear export- and safety-related missions, workshops, or seminars.
- Completed Joint U.S./Russia Nuclear Power Alternatives Study.

FY 1996 Accomplishments (to date and planned):

- Complete remaining training courses at training centers in Russia and Ukraine.
- Implement emergency operating instructions at VVER 440/230 pilot plant.
- Continue implementation of a Safety Panel Display System at a VVER-440/230 and RBMK reactor in Russia.
- Implement confinement improvements and an emergency DC power supply system at an RBMK plant.
- Implement backup emergency reactor cooling systems at a RBMK and a VVER-440/230 plant.
- Complete software for several analytical simulators and plant analyzers.
- Continue work on emergency operating instructions and conduct of operations procedures at remaining RBMK and VVER 440/230 pilot plants in Russia, Ukraine, Lithuania, Bulgaria, Slovakia, Hungary, and Czech Republic.
- Implement safety improvements that address maintenance problems.

590

FY 1996 Accomplishments (to date and planned) - continued:

- Provide Ukraine with an indigenous spent fuel storage capability.
- Train Russian and Ukrainian plant personnel to perform fire hazard analysis.
- Complete upgrades at the Trnava training center in Slovakia Republic to improve to western standards.
- Provide all training workshops, seismic analyses, and maintenance training support requested by Bulgaria.
- Complete the development and training on advanced applications for the RBMK plant analyzer at the Ignalina plant in Lithuania.
- Initiate replacement of electronic modules at Ignalina plant.
- Participate in three-to-five nuclear export-related missions, workshops, or seminars.
- Develop and maintain nuclear policy and market profiles.
- Initiate cooperation on decontamination and decommissioning planning for Chornobyl.

FY 1997 Planned Accomplishments:

- Complete emergency operating instructions at VVER-1000 and VVER-213 pilot plants.
- Implement Safety Panel Display Systems at five additional RBMK plants.
- Continue work to implement a non-destructive examination capability in countries with Soviet-designed plants.
- Complete installation of several full scope simulators in Russia and Ukraine.
- Implement fire safety improvements identified in plant-conducted, fire hazards analysis.
- Begin implementation of safety related instrumentation and control upgrades at RBMK and VVER plants.
- Complete plant specific safety evaluation reports for four nuclear plants in Russia and Ukraine.
- Initiate operational improvements in Ukraine in area of configuration management, event analysis and reporting.
- Complete installation and training on the Hungarian Paks plant analyzers.
- Complete advanced containment experiment extension project for the Czech Republic.

FY 1997 Planned Accomplishments - continued:

- Complete the Bulgarian VVER-1000 plant analyzer with the capability to simulate a full range of potential accidents.
- Provide all training workshops, seismic analyses, and maintenance training support requested by Bulgaria.
- Enhance U.S. lab and industry support of international nuclear safety centers through cooperative research and development projects..
- Participate in three to five nuclear export related missions, workshops, or seminars.
- Develop and maintain nuclear policy and market profiles.

Explanation of Funding Changes FY 1996 to FY 1997:

Funding in the amount of $15.4 million was received in late FY 1995 from U.S. AID and is being used for FY 1996 activities. An additional $15.4 million is anticipated from U.S. AID in FY 1996. These additional funds result in an effective budget of approximately $57 million for FY 1996. The increase in FY 1997 is primarily due to continuing the management and operational safety improvement projects, engineering and technology upgrades, and Chornobyl initiatives that were delayed due to lack of funding in FY 1996.

NUCLEAR SECURITY / RUSSIAN PRODUCTION REACTOR SHUTDOWN

PROGRAM MISSION

The mission of the Nuclear Security/Russian Production Reactor Shutdown program is to reduce the threats posed by continued operation of reactors that produce weapons materials, and to promote management practices that minimize the risks of proliferation of weapons-usable nuclear materials. Particular attention is paid to implementation of the U.S.-Russian agreement to cease the production of weapons grade plutonium. Additional program elements address spent fuel management, and the safety and nonproliferation concerns related to breeder reactors in the former Soviet Union..

The GOAL(S) of the Nuclear Security/Russian Production Reactor Shutdown program are to:

1. Ensure cessation of production of weapons-grade plutonium in the shortest time possible.

2. Support U.S. non-proliferation policy.

3. Address the safety and nonproliferation concerns related to breeder reactors in countries of the former Soviet Union.

4. Promote policies which reduce the need for reprocessing of nuclear fuel.

Major fissile materials processing and nuclear R&D sites in Russia.
Plotted on the map are plutonium production sites (triangles), nuclear weapons design laboratories (circles), uranium enrichment plants (asterisks), fuel fabrication facilities (squares) and major nuclear reactor institutes (diamonds). Boundary is that of the former Soviet Union.

The OBJECTIVES related to these goals are:

1. Prepare for conversion of Russia's production reactors to a mode that eliminates production of weapons-grade plutonium while still producing heat and electricity required by local communities, and identify long-term replacement power sources.

2. Engage in cooperative programs to address safety needs at breeder reactors in the former Soviet Union and promote their shutdown.

3. Develop spent fuel management plans to reduce the need for reprocessing in countries of the former Soviet Union.

PERFORMANCE MEASURES:

Performance measures for the Nuclear Security/Russian Production Reactor Shutdown program include:

1. Complete all necessary preparatory work to implement conversion of Russia's plutonium production reactors to a mode in which they produce do not produce weapons-grade plutonium.

2. Complete the effort to identify replacement power alternatives to substitute for operation of the production reactor.

3. Identification of alternatives to breeder reactors in former Soviet Union.

4. Introduction of spent fuel management plans that do not require reprocessing.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- First phase of feasibility study on fuel conversion demonstrates that conversion would be technically possible within three years, would eliminate the production of weapons grade plutonium, and would improve the safety of the reactors.
- First phase of nuclear replacement power option also completed.
- U.S. safety experts visited the Aqtau breeder reactor in Kazakhstan and Aqtau operators visited the United States.
- Cooperation began with the Russian regulatory body, Gosatomnadzor, on fuel cycle and research reactor safety.

PROGRAM FUNDING PROFILE

Sub-program	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp. Adjustments	FY 1996 Comparable Adjusted	FY 1997 Budget Request

	FY 1995 Comp	FY 1995 Non-Comp	FY 1996 Comp	FY 1996 Non-Comp	FY 1997
25.2 Other services	$ 0	$ 0	$ 0	$ 0	$ 6,000
99.9 **TOTAL**	**$ 0**	**$ 0**	**$ 0**	**$ 0**	**$ 6,000**

I. Mission Supporting Goals and Objectives

The U.S. is committed to ensuring the cessation of production of weapons grade plutonium. In Russia, this can be accomplished by converting the fuel in the production reactors so that they do not produce weapons-grade plutonium while producing heat and electricity. Such an effort will allow Russia the time needed to identify a replacement source for the heat and electricity produced by the reactors while still achieving an important nonproliferation objective.

The U.S. is also leading an effort to address the safety and nonproliferation concerns associated with breeder reactors in the former Soviet Union. Finally, in accordance with a U.S.-Russia agreement to address fuel cycle safety, NE will cooperate on safety at spent fuel storage facilities in Russia and on management practices that reduce or eliminate the need for reprocessing of spent fuel, a significant nonproliferation and environmental problem.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Preparatory work for conversion of Fuel in Russian Production Reactors and identifying replacement options	$ 0[1]	$ 0[1]	$2,500	$2,500	100
Expand Nuclear Safety and Nonproliferation Cooperation with International Agencies and Foreign Countries	0	0	1,000	1,000	100

TOTAL, Nuclear Security/Russian Production Reactor Shutdown	**$ 0**	**$ 0**	**$ 6,000**	**$ 6,000**	**100**

[1] Activities funded by State Department Nonproliferation and Disarmament Funds, and prior year Department funds.

III. Performance Summary

FY 1995 Accomplishments:

- Initiated fossil replacement power feasibility studies, which is currently funded by the Trade and Development Agency (TDA).
- Initiated core fuel conversion safety analysis and conceptual design study .
- Initiated nuclear replacement power options study for Seversk and Zheleznogorsk
- Initiated safety cooperation dialogue with Indian Atomic Energy Regulatory Board.
- Supported U.S. mission to explore nuclear security issues at Aqtau breeder reactor in Kazakhstan.

FY 1996 Accomplishments:

- Complete Phase I fossil replacement power feasibility studies for Tomsk, Seversk and Zheleznogorsk
- Complete production reactor fuel conversion safety analysis and conceptual design study; initiate final design and infrastructure upgrades.
- Complete Russian production reactor nuclear replacement power feasibility study.
- Lead DOE participation in the G-7 Nuclear Safety Summit.
- Increase multilateral and bilateral cooperation with key international nuclear agencies.
- Increase nuclear safety dialogues with India, China, South Africa, Ghana, and other countries with nuclear safety concerns.
- Support initiation of nuclear safety and security programs at Aqtau in Kazakhstan.

FY 1997 Accomplishments:

- Initiate conversion of reactors to power-productivity mode.
- Complete fossil replacement power feasibility studies for Tomsk, Seversk and Zheleznogorsk, and establish financial institution interest.
- Increase multilateral cooperation with key international nuclear agencies.
- Increase nuclear safety dialogues with countries with nuclear safety concerns.
- Implement nuclear safety and security programs at Aqtau in Kazakhstan and breeder reactors in Russia.
- Develop spent fuel management plans not requiring reprocessing for selected countries of the former Soviet Union.

Explanation of Funding Changes FY 1996 to FY 1997:

Funding has increased in FY 1997 due to implementation of the nuclear safety and security programs at Aqtau in Kazakhstan, support of the replacement power system for Russian plutonium production reactors, and spent fuel management.

NAVAL REACTORS

PROGRAM MISSION

Naval Reactors is responsible for all aspects of Naval nuclear propulsion — from technology development through reactor operations to, ultimately, reactor plant disposal. The Program's efforts are critical to the continued success of over 120 reactors in operating submarines and surface ships, comprising over 40% of the Navy's warships, and to the New Attack Submarine class under development.

The GOALS of the Naval Reactors program are:

Provide the U.S. Navy with safe, long-lived, militarily-effective reactor plants in keeping with the Nation's defense requirements, and ensure their continued safe and reliable operation.

The OBJECTIVES related to these goals are:

- Contribute to National security by meeting the Navy's needs for advanced, long-lived reactor plants, and ensuring the viability of operating Naval nuclear reactors and their operators' proficiency, while meeting high safety and environmental standards.

- Evaluate and improve Naval nuclear reactors to maintain the safety, potency, and longevity of U.S. nuclear-powered warships.

In continuing and enhancing the Program policies and practices which have achieved a world-wide reputation for excellence and safety, the STRATEGIES employed to realize these goals and objectives are:

- Maintain an integrated, comprehensive, and far-sighted analytical, developmental and testing effort for existing and future reactor plants:

  — continuously test, verify, and refine reactor technology — and integrate new technologies and techniques into existing system and component designs — to improve overall reactor plant performance, reliability and longevity;
  — rigorously test materials, fuel, cores, components and systems;
  — develop simplified, more affordable reactors with improved power capabilities, increased endurance, and added dependability.

- Ensure continued technical excellence and high quality in all Naval Nuclear Propulsion Program work.

- Maintain essential excellence in safety and environmental protection vital to National and world-wide acceptance of U.S. nuclear-powered warship operations.

PROGRAM MISSION — NAVAL REACTORS (Cont'd)

- Maintain a quality industrial base to provide materials, fuel, components, and cores meeting Navy requirements.
- Maximize facility use and stress efficient use of personnel to ensure requirements are met at minimum cost.
- Ensure non-proliferation of Naval nuclear technology.

PERFORMANCE MEASURES:

Naval Reactors is principally a technology program in the business of power generation for a military application. The Program's far-sighted development effort ensures nuclear propulsion technology provides options to maintain/upgrade current capabilities as well as meet future threats. Work is integrated as advances in various functional disciplines coalesce into the technology applicable to a Naval nuclear plant. The presence of radiation dictates a careful, measured approach to developing nuclear technology, evolving needed components and systems, and implementing them into existing or future plant designs. Intricate engineering challenges and long lead time to fabricate the massive, complex components require many years before introduction into the fleet. Decades will pass before overall success can be assessed, from the time a technology is conceived, to its development and application in the fleet, to the end of a ship's lifetime. With this in mind, the following high-level success indicators are representative of the outputs/outcomes of Naval Reactors' work:

- The number of cumulative reactor-years of safe operations for all Naval nuclear reactors exceeded 4,500 in FY 1995, and is estimated at over 4,600 in FY 1996 and over 4,700 in FY 1997, demonstrating the Program's continued safety and technical excellence and resulting operational success of Naval nuclear warships.
- The number of reactor classes in service will remain steady at nine through FY 1996 and 1997, indicating Naval Reactors' continued ability to support diverse plant types and technologies.
- The cumulative percentage of New Attack Submarine plant development and testing work completed was 30% in FY 1995, and estimated to be 45% in FY 1996 and 60% in FY 1997.
- The utilization factor for land-based prototype plants, a measure of the prototypes' availability for scheduled testing, training, and servicing needs, exceeded 90% in FY 1995, and is estimated to be at least 90% in FY 1996 and 1997.
- Inactivation work on six shutdown test/r&d plants will continue, reflecting progress in executing safe and responsible environmental clean-up. Defueling will be performed on the D1G plant in FY 1996, and on the S5G plant in FY 1997.
- In FY 1995, no Naval Nuclear Propulsion Program personnel exceeded Federal limits for radiation exposure, and no significant findings resulted from environmental inspections by state and federal regulators; nor are any expected in FY 1996 or 1997, reflecting the continued outstanding environmental record of the Program.

PROGRAM MISSION — NAVAL REACTORS (Cont'd)

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The Navy will continue to rely on nuclear-powered warships, which comprise over 40% of its major combatants. With their stealth, firepower, mission versatility, virtually unlimited high-speed endurance, and independence from logistics support, nuclear powered submarines and aircraft carriers are well-suited to rapid crisis response. Also, as long as strategic deterrence, power projection and sea control are a necessity, these highly-survivable ships will remain instrumental to National security.

- Naval Reactors' comprehensive responsibility is a Program hallmark and a key to the ongoing success of nuclear-powered warships, which have steamed safely over 100 million miles. This environmental and safety record has endured over 40 years, and surpasses that of any other nuclear program in the world. Program success results from thorough development, testing, and analysis of cores, components, and systems; stringent quality standards and rigorous training; and detailed analysis of operating components/plants to verify expected performance. The former Soviet Navy's nuclear propulsion safety record offers a stark contrast — they suffered casualties because of risks and inadequacies the U.S. would not tolerate.

- Operating Naval nuclear plants are being extended beyond their design lifetimes, as the Navy decides to keep ships in service for up to 40-50 years vice original expectations of 20 years; this requires careful, extensive validation and improvement efforts to ensure these plants will perform safely and reliably through end of life.

- Initial testing of the advanced fleet reactor for the SEAWOLF Class attack submarine is going well as expected; the lead ship of the class is scheduled to go to sea in 1996.

- Continuing development efforts are yielding greater capabilities. Ongoing efforts in metallurgy, thermal hydraulics, manufacturing and chemical processes, physics, and nuclear design/analysis methods provide the base for future propulsion plant development and improvements to existing ones. Naval Reactors is investigating new structural materials, coolant chemistries, reactor plant arrangements, core configurations, manufacturing techniques, plant and facility monitoring equipment, and heat exchanging methods. Features sought are enhanced power density, longer life, decreased weight, increased resilience, reduced corrosion, ease of operation, and affordability. Major efforts for the near future include upgrades to existing components and equipment to help extend operating ship lifetimes and improve overall reactor plant performance, and development/testing of the next generation reactor components and systems for the Navy's New Attack Submarine class -- including the first true life-of-the-ship core, which will obviate the need for expensive refuelings, and the new concept steam generator, which should greatly reduce corrosion concerns.

- The Program's cost-saving initiatives include shutting down six of eight land-based prototype plants by FY 1996. Though creating a substantial initial cost savings, full realization of savings is dependent on completion of a substantial, multi-year inactivation/servicing effort on the shut-down plants.

NAVAL REACTORS DEVELOPMENT
REACTOR TECHNOLOGY & ANALYSIS

I. Mission Supporting Goals and Objectives

Ensures the continued safe and reliable operation of existing reactors, and develops new reactors with improved power capabilities, increased endurance, added reliability and greater simplification. This is accomplished by exploiting advances in nuclear physics, reactor configuration design, analytical modeling, and manufacturing and inspection methods. Physics efforts are aimed at gaining a better understanding of reactor behavior fundamentals and actual performance to support maximization of core life and reliability. Thermal hydraulic and mechanical analyses are conducted to evaluate reactor performance and to verify and improve the accuracy of computer models which enable reactor optimization through improved predictive capabilities and reduced margin contingencies. Environmental and radiological efforts are conducted for all operations to protect employees, the public and the environment.

II. Funding Schedule:

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Budget Request	$ Change	% Change
Reactor Technology and Analysis*	$ 228, 613*	$ 212,851*	$ 192,000	$ -20,851	-10%

* Previously the Reactor Development budget category. Beginning in FY 1997, materials-related work will be consolidated in the Materials Development & Verification category.

III. Performance Summary:

FY 1995 Accomplishments:

- Conducted thermal-hydraulic, structural and fluid mechanics, and heat conversion analyses to optimize reactor performance, including: initiated testing of a mechanical test cell identical in size and geometry to a fueled reactor cell to qualify an advanced core design for next generation reactor; tested prototypic test sections to improve flow and power distribution predictive capability; designed tests for computational fluid dynamics model and code development; and tested proof-of-principle in-core heat conversion modules to evaluate cycle efficiencies.

- Developed improved inspection equipment and procedures to increase quality and enhance core performance, such as replacing conventional film radiography with real-time radiography of fuel elements.

- Designed and tested control drive mechanisms and other reactor equipment for future core designs, including: delivering control drive mechanism test units, and initiating performance evaluations such as machine shock, functional, life, and thermal tests; and initiating final design and structural analysis validation of reactor equipment.

- Evaluated core designs and improved manufacturing processes to determine core performance and feasibility of longer life spans, including: establishing criteria for evaluating performance of the high-performance fleet core during acceptance testing, evaluating core end-of-life test data; and developing manufacturing process improvements emphasizing reduced fabrication time for fuel elements.

- Developed advanced physics computer codes to support new reactors having reduced uncertainty and longer lives, including: qualifying an advanced 3D calculational technique; continuing optimization of codes for massively parallel computers; and completing testing of the advanced fuel assembly and initiating fuel removal in the full-core physics experiment facility.

PERFORMANCE SUMMARY — REACTOR TECHNOLOGY & ANALYSIS (Cont'd)

- Performed nuclear and physics analyses to ensure efficient operation and maximize core lifetime and power, including: initiating operational physics testing on the advanced fleet reactor prototype core to predict beginning-of-life physics and criticality parameters for the shipboard reactor, and developing end-of-plant-life physics tests for the S5G Prototype.

FY 1996 Accomplishments (to date and planned):

- Conduct engineering analyses to develop and qualify improved core and reactor component designs, including: flow testing of the next generation reactor mechanical test cell, initiating final testing of prototypic test sections to support improved flow and power distribution models; computational fluid dynamics code development and code validation; testing a modified hydraulic design and evaluating applications; and evaluating core design for increased heat capability.

- Evaluate upgrades to inspection equipment including assessing electromagnetic acoustic transducers for flaw detection in welds.

- Analyze and test improved reactor equipment and control drive mechanisms including functional, life, and thermal tests on control drive mechanism test units.

- Develop, test and evaluate core designs and manufacturing processes to confirm satisfactory performance through end of life and extend life span, including: establishing adequacy of high-performance fleet core performance based on post-acceptance test data; evaluating S1C end-of-life performance test data; and evaluating high-temperature fuel system integration into reactor design.

- Develop, enhance, and validate via operating data, various physics computer codes, including: qualifying computer programs to improve the prediction of reactor operational transients; establishing initial computational capabilities and benchmarks for advanced supercomputers; and completing removal and shipment of fuel from the full-core physics experiment facility.

- Conduct nuclear analyses and physics testing to ensure efficient fuel loading and utilization, and maximize core lifetimes and power, including: analyzing results of beginning-of-life advanced fleet reactor prototype physics testing to demonstrate the core is operating as designed; analyzing S5G end-of-plant-life prototype test results; and generating a nuclear design model to follow advanced fleet reactor prototype core depletion.

FY 1997 Planned Accomplishments:

- Conduct thermal-hydraulic, structural and fluid mechanics, and heat conversion analyses to advance reactor design, improve performance, and allow less-restrictive operating procedures, including: shock and vibration testing of the next generation reactor mechanical test cell; final testing of prototypic test section for flow and power distribution; validating and qualifying an advanced fluid dynamics code; evaluating improvements to enhance core power capabilities based on a modified hydraulic design; and evaluating concepts for higher core heat capability.

- Assess improved inspection procedures to reduce costs and ensure quality.

- Evaluate performance of control rod drive mechanisms and reactor equipment, including: establishing test limits for control drive mechanisms; performing shock analyses; and developing improved techniques for predicting and analyzing dynamic structural load impacts.

PERFORMANCE SUMMARY — REACTOR TECHNOLOGY & ANALYSIS (Cont'd)

- Analyze, test and evolve core designs and manufacturing processes to validate performance and obtain longer life spans, including: initiating analysis to validate advanced fleet reactor prototype operation to end of reactor life; developing improved models of high-temperature fuel system performance; and applying an improved fabrication process to fuel test specimens.

- Develop and enhance advanced computer programs for reactor physics and other nuclear design applications to verify reactor performance and design new, longer-lived reactors with reduced uncertainties, including: automating a common procedure for both Monte Carlo and diffusion theory computations; improving the precision of nuclear design/analysis programs through use of advanced computers; and laying-up the full-core physics experiment facility in preparation for decommissioning.

- Conduct nuclear and physics testing to maximize core lifetime and power and determine optimal operating characteristics, including: completing development of an advanced fleet reactor nuclear design model.

Explanation of Funding Changes FY 1996 to FY 1997:
The $20,851,000 decrease reflects progress on next generation reactor design.

NAVAL REACTORS DEVELOPMENT
MATERIALS DEVELOPMENT & VERIFICATION

I. Mission Supporting Goals and Objectives

Develop, qualify, and test nuclear fuel, cladding, structural, and component materials suitable for use in the demanding environment of an operating nuclear plant. Materials must be capable of maintaining their structural and mechanical integrity over decades in a high temperature, high pressure, corrosive environment. Attention is given to testing and evaluating materials in use to verify acceptability for safe operation over a component's lifetime, to developing and applying new testing methods and insights, and to extending materials in use to new applications. Work is also aimed at the development and qualification of materials with improved mechanical and physical traits - and increased corrosion resistance which will improve plant integrity and performance and open new design opportunities. Quality control is an inherent part of all materials work, and manufacturing processes are developed and refined to ensure materials are produced efficiently and to stringent specifications.

II. Funding Schedule:

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Budget Request	$ Change	% Change
Materials Development and Verification*	$ 100,000*	$ 102,000*	$ 110,000	$ +8,000	+ 8%

* Previously the Material Development subcategory of the Reactor Development category. Beginning in FY 1997, materials work is identified as a separate category combining related efforts from Reactor and Plant Development. This change reflects the increased emphasis on this work —as the expected lifetime of the nuclear fleet increases to up to 50 years for some ships, verification of in-service materials and development of more corrosion and stress-resistant materials is paramount to ensure safe operation over component lifetime.

III. Performance Summary:

FY 1995 Accomplishments:

- Developed improved core and core structural materials and improved fabrication processes, including: refining a new fuel manufacturing process with reduced cost and environmental concerns; initiating a testing program to verify improved corrosion resistance of materials; demonstrating a modified thread forming process for core fastener materials; and developing improvements to high temperature materials such as silicon carbides so they will perform adequately in a reactor environment.

- Improved understanding of plant component material performance to support assurance of dependability, including: developed stress corrosion cracking analytical models; conducted tests to confirm improved stress corrosion cracking behavior of materials; and conducted material property and metallographic examinations on samples removed from operating components.

- Maximized advanced test reactor availability to irradiate material test specimens, allowing reduced number of test loops by expediting specimen installation and removal and minimizing associated shutdown time; prepared test trains for irradiation and evaluated information obtained to update databases for predicting material performance in operating reactors.

FY 1996 Accomplishments (to date and planned):

- Continue development efforts for improved fuel, cladding, structural materials and fabrication processes including: implementing a new process for manufacturing Naval nuclear fuel; completing testing necessary to qualify materials for fastener applications with improved stress corrosion cracking behavior; and testing and evaluating materials for application in higher temperature reactors.

PERFORMANCE SUMMARY — MATERIALS DEVELOPMENT & VERIFICATION (Cont'd)

- Conduct testing and evaluation of plant materials to characterize effects of operating environment and to support lifetime reliability decisions, including: developing predictive models and conducting confirmatory testing to determine factors contributing to stress corrosion cracking; completing an assessment of the significance of environmentally assisted fatigue cracking for reactor vessels; and performing material examinations of components removed from operating plants to obtain performance data.

- Continue prototypic irradiations examination and testing in the advanced test reactor to ensure material integrity in the harsh reactor environment.

FY 1997 Planned Accomplishments:

- Develop improved core and core structural materials and fabrication processes, including: updating corrosion models; conducting post-irradiation crack growth rate testing of materials to support new stress corrosion cracking predictive models; and furthering development of structural materials and fuel for higher temperature applications.

- Improve plant material performance and performance predictive capabilities by actions such as: determining and characterizing fundamental factors contributing to stress corrosion cracking, and conducting destructive and non-destructive examinations such as scanning electron microscopy and energy dispersive x-ray evaluation of samples from components removed from operating reactor plants.

- Prepare test trains and irradiate material test specimens to duplicate effects of a reactor environment; evaluate irradiations effects on materials to increase understanding of material performance and verify safe application of materials over reactor design lifetime.

Explanation of Funding Changes FY 1996 to FY 1997:
The $8,000,000 increase reflects increased materials analysis and testing needed to support the long lifetimes of Navy's ships.

NAVAL REACTORS DEVELOPMENT
PLANT TECHNOLOGY

I. Mission Supporting Goals and Objectives

Development and analysis of equipment and systems which transfer, convert, store, control and measure power created by the reactor. Work aims at maximizing plant performance and minimizing maintenance by evaluating existing components, integrating new technologies into current and new equipment designs, and proving concepts through testing. Key areas include conventional and new concept steam generator technology and testing; instrumentation and control; plant configuration and component development, verification and testing; and plant performance and safety analysis.

II. Funding Schedule:

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Budget Request	$ Change	% Change
Plant Technology*	$ 142,000*	$ 120,700*	$ 116,000	$ - 4,700	- 4%

* Previously the Plant Development budget category.

III. Performance Summary:

FY 1995 Accomplishments:

- Developed and improved steam generator technology to reduce maintenance costs, including: designed a test assembly for chemistry testing; performed qualification and prototype tests on corrosion-inhibiting alternate steam generator chemistries; conducted transient testing of small-scale steam generator to provide feedback for incorporation into full-size designs; fabricated heat exchanger piece parts and began fabrication of the new concept steam generator manufacturing demonstration unit.

- Developed and tested new instrumentation and control (I&C), including: tested prototype standardized I&C concepts to determine feasibility; and built and tested advanced solid-state switching devices.

- Designed, developed, and verified reactor plant and component designs to reduce complexities, simplify maintenance and lower costs, including: performed pressure and shock analysis for support structures and completed next generation reactor component drawings; built and tested electrical generator modules and evaluated cycle efficiencies; performed advanced fleet reactor plant flow testing to evaluate any problems encountered during initial startup.

- Performed reactor plant analyses to assure safe operation and lower costs.

FY 1996 Accomplishments (to date and planned):

- Continue steam generator technology improvements including: begin corrosion and deposition testing of test assemblies in different chemistries; perform steady-state testing of the high power test unit over a range of operating conditions, and incorporate changes into analysis tools for full-size unit design as necessary; fabricate new concept steam generator manufacturing demonstration unit.

- Improve reactor plant I&C and power generation applications, including: develop detailed standardized I&C design to replace aging equipment; build/test new solid-state electronic devices and develop design improvements.

PERFORMANCE SUMMARY — PLANT TECHNOLOGY (Cont'd)

- Improve components and reactor plant designs, including: perform detailed analyses and finalize next generation reactor component features to permit fabrication; evaluate electrical generator modules; conduct plant component flow testing to evaluate performance.

- Conduct reactor plant protection and safe operation analysis.

FY 1997 Planned Accomplishments:

- Improve steam generator technology, including: begin large-scale steam generator testing to qualify thermal hydraulic analysis models; and assemble new concept steam generator manufacturing demonstration unit.

- Develop I&C emphasizing advanced generic designs, including: begin testing detailed standardized I&C design for performance; and test scaled versions of solid-state electronic devices and incorporate lessons learned.

- Carry out component and reactor plant design and testing, including: resolve design issues and develop changes identified during fabrication of new plant test components and perform qualification testing; develop prototypical testing for electrical generator modules to demonstrate technology scalability; conduct plant component flow testing to evaluate performance.

- Analyze and test reactor plant operation and protection systems.

Explanation of Funding Changes FY 1996 to FY 1997:
The $4,700,000 decrease reflects progress on new plant development efforts.

NAVAL REACTORS DEVELOPMENT
EVALUATION & SERVICING

I. Mission Supporting Goals and Objectives

Operate, maintain and service the Program's land-based prototype Naval nuclear propulsion plants and the advanced test reactor plant. Testing of materials, components, cores, and systems in these plants provides important technical data and experience under actual operating conditions. Increased sophistication in computer modeling of reactor plant conditions, growing accumulation of operational data, and reduced need for training of Navy reactor plant operators have enabled shut down of five of eight prototype plants with a sixth to be shutdown in 1996 resulting in substantial initial cost savings; full realization of savings is dependent on defueling and long-term inactivation efforts currently underway, which will leave these facilities in an environmentally-benign state. Evaluation and servicing work also encompasses maintaining environmental quality at all Naval Reactors sites and examination of expended reactor cores. These examinations provide end-of-life characteristics and validate calculated predictions. Information obtained provides valuable feedback for improving fleet operations and designing new cores.

II. Funding Schedule:

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Budget Request	$ Change	% Change
Evaluation & Servicing*	$ 154,000*	$ 155,517*	$ 162,130**	$ +6,613	+4%

* Previously the Reactor Operation & Evaluation category. **Other evaluation related work previously in other Naval Reactors Development categories, such as advanced test reactor operations and expended core examinations, has been consolidated into Evaluation & Servicing.

III. Performance Summary:

FY 1995 Accomplishments:

- Received, unloaded and examined spent fuel from the S3G prototype.
- Completed defueling of the S1C prototype and began disassembly of non reactor compartment structures at the Windsor site.
- Operated the S5G, MARF, S8G, and D1G prototypes for testing and training at a utilization factor greater than 90%.
- Performed an end-of life test program and final reactor shutdown on the S5G prototype.
- Depleted the developmental materials core in the MARF prototype.
- Depleted the advanced fleet reactor core in the S8G prototype.

PERFORMANCE SUMMARY — EVALUATION & SERVICING (Cont'd)

FY 1996 Accomplishments (to date and planned):

- Receive, unload and examine spent fuel from the S1C prototype.
- Initiate defueling preparations for the A1W-B prototype plant.
- Perform end-of-life test program, final reactor shutdown, and begin defueling at the D1G prototype.
- Operate the MARF and S8G prototypes to deplete their test cores and for training at a utilization factor of greater than 90%
- Perform S3G off hull systems and engine room removal.
- Continue dismantlement of non-reactor compartment structures at the Windsor site.

FY 1997 Planned Accomplishments:

- Defuel the A1W-B prototype.
- Operate the MARF and S8G prototypes for testing at a utilization factor of greater than 90%, and continue efficient operation of the advanced test reactor.
- Continue depleting the test cores in the MARF and S8G prototypes.
- Perform S1C off hull system and building removal and engine room structure removal.
- Begin reactor compartment dismantlement of the S1C prototype.
- Develop conceptual design for an Expended Core Facility dry storage container loading station.
- Complete defueling of the D1G prototype and begin disassembly of non reactor compartment structures.
- Conduct dismantlement of non reactor compartment structures at the S3G prototype.

Explanation of Funding Changes FY 1996 to FY 1997:
The $6,613,000 growth reflects increased prototype plant inactivation efforts.

Major Issues:
The reactor plant inactivation activities funded in this category are vital to accomplish environmental remediation, obtain important reactor core performance data, and reduce caretaker costs. The FY 97 budget request will support partial accomplishment of this work. This level of funding will not support the full scope of inactivation work.

PROGRAM DIRECTION

I. Mission Supporting Goals and Objectives

Funds salaries, benefits, travel and expenses for the 209 full-time Federal employees at the Naval Reactors Headquarters, Pittsburgh and Schenectady Naval Reactors, and Idaho Operations Offices who manage the Naval Nuclear Propulsion Program.

Due to the critical nature of the work, Naval Reactors is a centrally-managed organization. This places a heavy burden on the Federal employees who oversee and set policies/procedures for ships, shipyards, contractors, and the Bettis and Knolls Atomic Power Laboratories, as well as interface with other DOE offices and local, state, and Federal regulatory agencies. 10 FTEs at the Idaho Operations Office oversee operation of the advanced test reactor, which Naval Reactors uses for materials irradiation and testing.

II. Funding Schedule:

Full Time Equivalents	216	211		211	209
Average	86	88		88	90

III. Performance Summary:

FY 1995 Measurable Performance Activities:
Continued to successfully direct technical work, provide management/oversight of laboratories and facilities, and ensure safe and reliable operations of Naval nuclear plants and the advanced test reactor. Reduced by 3 FTEs compared to previous FY 1995 allocation.

FY 1996 Measurable Performance Activities:
Continue as in FY 1995. Reduced an additional 5 FTEs compared to FY 1995.

FY 1997 Measurable Performance Activities:
Continue as in FY 1996. Reduced an additional 2 FTEs compared to FY 1996.

IV. Explanation of Funding Changes FY 1996 to FY 1997:
Increase of $372,000 is due to impact of inflation, employee buyouts, and distribution of the Working Capital Fund.

V. Explanation of Average FTE Costs:
Headquarters: Increase in FTE costs reflects impact of inflation, employee buyouts and distribution of the Working Capital Fund.
Schenectady Naval Reactors: Increase in FTE costs reflects impact of inflation and employee buyouts.
Pittsburgh Naval Reactors: Increase in FTE costs reflects impact of inflation and employee buyouts.

NAVAL REACTORS DEVELOPMENT

1. Project Title and Location: Advanced Test Reactor Secondary Coolant System Refurbishment
Idaho National Engineering
Laboratory, Idaho

2a. Project No. 97-D-201
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1995

3b. A-E Work (Titles I & II) Duration: 9 Months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- N/A
Total Project Cost (TPC) -- N/A

4a. Date Physical Construction Starts: 3rd Qtr. FY 1997

4b. Date Construction Ends: 4th Qtr. FY 1999

6. Current Cost Estimate:
TEC -- $5,000
TPC -- $5,554

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$ 400	$0	$ 400	$ 327
1998	4,100	0	4,100	3,774
1999	500	0	500	899

8. Project Description, Justification and Scope

This effort upgrades major portions of the secondary coolant system which removes excess heat generated by the advanced test reactor.

The project scope includes replacing and refurbishing buried piping systems and cooling tower piping, structure and heat transfer material to improve the overall efficiency of the system. Examples of work include the following:

- Replacement of damaged wood structure members;
- replacement of water control valves; and
- replace damaged heat transfer materials

The secondary coolant system has deteriorated due to corrosion, age, and leaks. The cooling tower upper framing and fan deck were replaced in 1992; however, numerous problem areas remain which affect tower control, thermal efficiency, and life expectancy. Refurbishment of the system is necessary to provide a 20 year life extension of the tower and related piping system to support continuous operation of the reactor. Through FY 1997, the project is expected to be 10% complete.

2b. Construction Funded

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 772
1. Engineering design and inspection at approximately 10 percent of construction costs	$ 265	
2. Construction management	219	
3. Project management	288	
b. Land and land rights		0
c. Construction costs		$ 2,451
1. Improvements to land		
2. Buildings		
3. Other structures	2,451	
4. Utilities		
5. Special Facilities		
d. Standard Equipment		0
e. Major computer items		950
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		$ 4,173
Subtotal		827
h. Contingencies at approximately 20 percent of above costs		$ 5,000
i. Total line item cost (Section 12. a. 1. (a))		0
j. Non-Federal Contribution		$ 5,000
Net Federal total estimated cost (TEC)		

10. Method of Performance

Design and inspection will be performed by Lockheed Idaho Technologies Company and by the operation contractor. Construction will be performed under subcontracts awarded on the basis of competitive bidding.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
(a) Line item -- Narrative not required.
(b) Expense-funded equipment -- Narrative not required.
(c) Inventories -- $50K will be spent for procurement of spare parts.

2. Other project costs
(a) R&D necessary to complete to complete construction -- Narrative not required.
(b) Conceptual Design Costs -- $68K was spent in FY 1994 and 1995 for development of the Functional and Operational Requirements (F&ORs), conceptual design and a value engineering study.
(c) D&D -- Narrative not required.
(d) NEPA documentation costs -- $29K will be spent FY 1995 and FY 1996 to prepare NEPA documentation for the project.
(e) Other project-related costs -- $42K will be spent in FY 1996 to prepare Project Management Plan, Quality Program Plan, and Configuration Management Plan. $865K will be spent in FY's 1997-99 to prepare plant operating documentation, testing, facility interface drawing as built, facility configuration change control documentation, and readiness reviews.
(f) Non-Federal Contributions -- Narrative not required.

b. Related annual funding
1. Total Facility operating costs -- Narrative not required.
2. Facility maintenance and repair costs -- $4K will be spent annually for preventative maintenance and instrument calibration.
3. Programmatic operating expenses directly related to the facility -- N/A
4. Capital Equipment not related to construction but related to programmatic effort in the facility -- N/A
5. GPP or other construction related to the programmatic effort in the facility -- N/A
6. Utility costs -- Narrative not required.
7. Other costs -- N/A

627

NAVAL REACTORS DEVELOPMENT

1. Project Title and Location: Laboratory Systems and Hot Cell Upgrades
Bettis Atomic Power Laboratory
Idaho Falls, Idaho and West Mifflin, Pennsylvania

2a. Project No. 95-D-200
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1995

3b. A-E Work (Titles I & II) Duration: 27 Months

4a. Date Physical Construction Starts: 1st Qtr. FY 1996

4b. Date Construction Ends: 4th Qtr. FY 1998

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $19,600
Total Project Cost (TPC) -- $23,650

6. Current Cost Estimate:
TEC -- $19,600
TPC -- $23,650

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1995	$2,400	$0	$2,400	$1,292
1996	11,300	0	11,300	6,200
1997	4,800	0	4,800	6,000
1998	1,100	0	1,100	6,108

8. Project Description, Justification and Scope

Modification and upgrading of various Bettis Atomic Power Laboratory support systems and facilities, including the following: hot cell refurbishment; shock test facility construction; facility modifications; and building and site renovations or reconfigurations.

Upgrading of aging facilities at the Bettis Atomic Power Laboratory sites. Most of the buildings and infrastructure date to the 1950's and require upgrading to keep up with technological advancements and to serve their function. The following principal areas are being renovated:

- renovation of hot cells and their associated ventilation and safety systems to curtail increasing maintenance costs as the cells age, and to reduce worker radiation exposure by eliminating the need to enter the hot cells for most repairs. The hot cells have not been refurbished since 1971;
- construction of a shock and vibration test facility to provide a test platform to perform low frequency shock qualification testing. This facility will significantly reduce costs associated with the qualification of plant components.
- renovations to some existing laboratory spaces to meet evolving Federal and State standards;

1. Project Title and Location: Laboratory Systems and Hot Cell Upgrades
Bettis Atomic Power Laboratory
Idaho Falls, Idaho and West Mifflin, Pennsylvania (Continued)

2a. Project No. 95-D-200
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

- new windows and air conditioning systems for older buildings to achieve federal energy conservation goals;

Through FY 1997, 80% of the project is expected to be complete.

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 5,200
1. Engineering design and inspection at approximately 28 percent of construction costs a/	$3,200	
2. Construction Management Costs	1,340	
2. Project management at 6 percent of construction costs	660	
b. Land and land rights		0
c. Construction costs		$ 11,400
1. Improvements to land	0	
2. Buildings	8,200	
3. Utilities	200	
4. Special Facilities	3,000	
d. Standard Equipment		300
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		100
Subtotal		$17,000
h. Contingencies at approximately 15 percent of above costs		2,600
i. Total line item cost (Section 12. a. 1. (a))		$19,600
j. Non-Federal Contribution		0
Net Federal total estimated cost (TEC)		$19,600

NOTE: a/ Includes construction follow and equipment installation engineering costs related to the hot cell upgrades. The percent of construction and equipment value is high because of the significant Bettis design and inspection required for this unique facility.

10. Method of Performance

Design will be accomplished under a negotiated Engineering Services Subcontract. Construction and procurement of equipment will be via fixed price contracts awarded on the basis of competitive bidding or by site operating contractor. Title III inspection will be conducted by operating contractor surveillance and supported for some items by the engineering services subcontractor.

2a. Project No. 95-D-200
2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item -- Narrative not required.
   (b) PE&D -- None.
   (c) Expense-funded equipment -- None.
   (d) Inventories -- None.
   (e) Non-Federal Contribution -- None.
2. Other project costs
   (a) R&D necessary to complete to complete construction -- $150,000 needed for overhead manipulator power and control system development.
   (b) Conceptual design costs -- Conceptual design costs are estimated at $400,000.
   (c) Other project related funding -- Decontamination will cost $3,400,000 and mockup skills training will cost $100,000.

b. Related annual funding (estimated life of project-- 40 years)

1. Facility operating costs -- Annual operating costs to maintain components such as valves, pumps, motors, and filters.
2. Facility maintenance and repair costs -- None.
3. Programmatic operating expenses directly related to the facility -- None.
4. Capital Equipment not related to construction but related to the programmatic effort in the facility -- Estimate includes replacement of operating equipment on a 15 year cycle.
5. GPP or other construction related to the programmatic effort in the facility -- None.
6. Utility costs -- None.
7. Other costs -- None.

Total Estimated Cost (TEC) -- $6,000
Total Project Cost (TPC) -- $6,691

6. Current Cost Estimate:
TEC -- $6,000
TPC -- $6,805

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1995	$ 700	$0	$ 700	$ 334
1996	4,800	0	4,800	4,386
1997	500	0	500	1,280

8. Project Description, Justification and Scope

This effort upgrades key portions of the radioactive waste system which handles liquid radioactive effluent and radioactively contaminated resins from the Advanced Test Reactor facility.

The current radioactive waste system, consisting of underground single wall piping and storage tanks, has no capability to monitor system integrity. Several storage tanks are suspected of having leaked and have been removed from service. This upgrade ensures system integrity by providing the ability to monitor for leaks, increase storage capacity, and provide waste sampling and chemical mixing capability before shipment.

This project will also provide an enclosed, heated, all-weather truck transfer facility for radioactive liquid waste and resin transfer. Resin transfer is currently conducted at two separate transfer stations located outside the Advanced Test Reactor building. Since these stations are outdoors and unprotected, they create a risk of freezing and accidental leaks or spills potentially resulting in operational shutdown. Although some temporary actions have been taken, the remaining risks warrant the need to move this operation into an enclosed facility permitting year-round use with controlled effluent discharge. Through FY 1997, the project is expected to be 100% complete.

8. Project Description, Justification and Scope

The Expended Core Facility (ECF) Dry Cell will consist of a dry shielded fuel handling, disassembly, examination and shipping facility, a decontamination shop, and a shielded repair shop. The facility and shops will be located in the existing ECF building South Bay and will be connected to the existing water pits. The facility will receive expended nuclear cores and ship disassembled fuel pieces to the Idaho Chemical Processing Plant. An approximately 16,000 square foot addition to the south of the existing 215,000 square foot ECF building is included to accommodate a shipping truck bay, spares storage, control room, and mockup training area. The addition will be of concrete block construction, poured in place steel reinforced concrete floor, and metal deck roof with a built-up elastomeric covering.

The dry shielded facility design will incorporate high density concrete radiation shielding and highly filtered air ventilation for radiological contamination control. Shielded lead glass windows and viewing aids will be provided at the various stations. The facility will include automated equipment for fuel module disassembly, examination, and shipment. Features of the production line include the water pit to dry cell delivery system, the examination system, the cutting system for separation of modules, and the prepared fuel shipping station. The dry (unmoderated) environment of the hot cell allows efficient material handling with a high degree of safety. The dry cell will have a design life of 40 years.

8. Project Description, Justification and Scope (Continued)

The decontamination and repair shops will be integrally connected to the dry shielded facility via a shielded door and to the water pits via a canal. The shops will be serviced by small cranes and a transfer system sized to handle the largest piece of facility equipment.

The Dry Cell establishes work areas and equipment needed for efficient handling of expended nuclear cores. The receipt of expended nuclear cores has increased since the late 1980s. Additionally, many of these expended cores are larger and heavier than those ECF was originally designed to handle. Existing facilities and systems cannot efficiently meet the increased workload. Today, work is accomplished in water pits at ECF. These underwater fuel disposal methods are manpower intensive and have significant technical disadvantages. These technical disadvantages include extremely difficult equipment and facility maintenance, poor visibility, time-consuming shipping cask loading, and a significant burden of administrative and physical controls for nuclear safety. The use of a dry cell would significantly reduce these disadvantages.

A June 1993 court injunction placed this work on hold until completion of the Spent Fuel Environmental Impact Statement (EIS). The EIS Record of Decision was issued in June 1995. Procurement of equipment and facility design is recommencing. Based on recent agreements with the State of Idaho, restart of physical construction is anticipated in the spring of 1996. The project is scheduled to complete late in FY 1998. Through FY 1997, 85% of the project is expected to be complete.

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$17,100
1. Engineering design and inspection at approximately 51 percent of construction costs a/	$11,210	
2. Construction Management Costs	2,890	
3. Project management at 14.0% percent of construction costs (Item c)	3,000	
b. Land and land rights	0	
c. Construction costs		21,800
1. Improvements to land	200	
2. Buildings	12,730	
3. Utilities	2,050	
4. Special Facilities	6,820	
d. Standard Equipment		5,100
e. Removal cost less salvage		0
f. Design and project liaison, testing, checkout and acceptance		1,300
Subtotal		$45,300
g. Contingencies at approximately 7 percent of above costs		3,346
h. Total line item cost (Section 12. a. 1. (a))		$48,646
i. Non-Federal Contribution		0
Net Federal total estimated cost (TEC)		$48,646

NOTE: a/ Includes field inspection and equipment installation engineering checkout costs. The percent of construction and equipment value is high because of the significant Bettis design and inspection required for this unique facility.

10. Method of Performance

Contracting arrangements are as follows:

1. Project Title and Location: Expended Core Facility
Dry Cell Project
Bettis Atomic Power Laboratory, Idaho (Continued)

2a. Project No. 90-N-102
2b. Construction Funded

10. Method of Performance (Continued)

(a) Construction design will be performed under an Engineering Services Subcontract. Equipment will be designed by the operating contractor.
(b) Construction and procurement will be accomplished by fixed price contracts awarded on the basis of competitive bidding.
(c) Title III Inspection: By Engineering Services Subcontractor under operating contractor surveillance.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1995	FY 1996	FY 1997	Outyears	Total
a. Total project costs						
1. Total facility costs						
(a) Line item (Section 10. i.)	$21,419	$ 535	$ 8,535	$11,330	$ 6,827	$48,646
(b) Oper. Exp. funded equipment	0	0	0	0	0	0
(c) Inventories	0	0	0	0	0	0
Total facility cost (Federal and Non-federal	$21,419	$ 535	$ 8,535	$11,330	$ 6,827	$48,646
2. Other project costs						
(a) R&D necessary to complete project	$ 0	$ 0	$ 0	$ 0	$ 0	$ 0
(b) Conceptual design costs	1,000	0	0	0	0	1,000
(c) Decontamination & Decommissioning (D&D)	0	0	0	0	0	0
(d) NEPA Documentation costs	0	0	0	0	0	0
(e) Other project-related costs	990	255	0	0	136	1,381

Total project cost	$23,409	$ 790	$ 8,535	$11,330	$ 6,963	$51,027
(f) Non-Federal contribution	0	0	0	0	0	0
(g) Net Federal total project cost (TPC)	$23,409	$ 790	$ 8,535	$11,330	$ 6,963	$51,027

b. Related annual funding (estimated life of project--40 years)	
1. Facility operating costs	$ 288
2. Facility maintenance and repair costs	0
3. Programmatic operating expenses directly related to the facility	1,620
4. Capital Equipment not related to construction but related to the programmatic effort in the facility	357
5. GPP or other construction related to the programmatic effort in the facility	0
6. Utility costs	0
7. Other costs	0
Total related annual funding	$ 2,265

1. Project Title and Location:	Expended Core Facility Dry Cell Project Bettis Atomic Power Laboratory, Idaho (Continued)	2a. Project No. 90-N-102 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item -- Narrative not required.
      (b) PE&D -- None.
      (c) Expense-funded equipment -- None.
      (d) Inventories -- None.
      (e) Non-Federal Contribution -- None.

   2. Other project costs
      (a) R&D necessary to complete to complete construction -- None.
      (b) Conceptual design -- No narrative required.
      (c) Other project-related funding -- Project startup and training are estimated to cost $136,000. An additional $1,245,000 is to procure several prototype items to support equipment design and confirm system operations.

b. Related annual funding -- The facility is expected to be used 40 years for its programmatic purpose.
   1. Facility operating costs -- The major elements comprising the annual operating costs are electrical power, and steam heat costs, and maintenance items such as utility lines, valves, pumps, motors, and support systems.
   2. Programmatic operating expenses directly related to the facility -- Includes operating manpower of 18 people.
   3. Capital equipment not related to construction but related to the programmatic effort in the facility -- Estimated cost includes replacement of operating equipment on a 15 year cycle.

DEFENSE NUCLEAR WASTE DISPOSAL

I. Mission Supporting Goals and Objectives

The goal of the Defense Nuclear Waste Disposal Program is to dispose of high-level waste generated from atomic energy defense activities. The primary focus of this program is to find a long term geological repository for Defense Nuclear Waste. This effort supports the Yucca Mountain Site Characterization Project and is described in greater detail in the Nuclear Waste Fund Budget Request.

Pursuant to the Nuclear Waste Policy Act (NWPA) of 1983, the Nuclear Waste Fund (NWF) has incurred costs for activities related to disposal of high-level defense waste. The balance owed by the federal government was approximately $1,098 million (including principal and interest) at the end of FY 1995.

646

II.	Funding Schedule	FY 1995	FY 1996	FY 1997	$Change	% Change
	Defense Nuclear Waste Disposal	$129,430	$248,400	$200,000	$-48,400	-19%

The FY 1996 Energy and Water Appropriation held $85 million reserve for the construction of an Interim Storage Facility.

EXECUTIVE BUDGET SUMMARY

In support of the U.S. Department of Energy's (DOE) mission, the Office of Nuclear Energy, Science and Technology (NE) has a mission to provide technical leadership for domestic and international nuclear issues. NE will support energy supply diversity and advance U.S. competitiveness and security by providing nuclear products and services to the U.S. and the world community in a safe, environmentally-sound and economical manner.

To accomplish this mission, the Office has established ten goals to guide its major programs. The goals relate to the Department's strategic plan. The goals of this Office are to:

- Cooperate with others to improve the safety of nuclear activities internationally
- Cooperate and coordinate with other Departmental offices and government agencies in the implementation of U.S. non-proliferation policy
- Ensure a reliable supply of medical, research, and industrial isotopes consistent with customer needs
- Support maintenance of the light water reactor option for domestic electricity generation
- Provide compact, safe nuclear power systems and related technologies to space, national security, and other customers
- Manage NE facilities and Office of Energy Research (ER) research reactors in a safe, economic, and environmentally-sound manner
- Contribute to the U.S. nuclear education infrastructure
- Foster U.S. industrial competitiveness through technology transfer and increased exports of nuclear goods and services
- Develop advanced nuclear technologies to address high-priority challenges
- Meet or exceed National Performance Review objectives to make government more effective, efficient, and responsive

Cooperate with Others to Improve the Safety of Nuclear Activities Internationally

DOE is committed to enhancing the safety of nuclear facilities throughout the world, and several initiatives are under way to increase international cooperation in this area. For example, cooperative research and development is being conducted with countries that have advanced nuclear programs, such as Japan, the United Kingdom, and South Korea. Additionally, steps are being taken to improve nuclear safety practices and technology in countries such as India and China. DOE also provides policy and technical leadership to international organizations that are concerned with nuclear safety.

Much of DOE's international nuclear safety effort is aimed at improving the safety of Soviet-designed nuclear power plants. The Chornobyl nuclear accident in 1986 focused world attention on the safety problems of Soviet-designed nuclear power plants. The 66 Soviet-designed nuclear power plants currently operating in Russia, Ukraine, and Central and Eastern Europe were designed and built to lesser safety standards than plants in the West, and are generally recognized to have significant safety deficiencies.

The Chornobyl nuclear accident in 1986 focused world attention on the safety problems of Soviet-designed reactors.

In coordination with other government agencies, DOE is assisting countries with Soviet-designed nuclear power plants in bridging the gap between internationally-accepted safety practices and their existing level of design, maintenance, and operation. DOE also is working to facilitate Ukraine's shutdown of the Chornobyl units still in operation.

Program: International Nuclear Safety Program

FUNDING PROFILE		
FY 1995	**FY 1996**	**FY 1997**

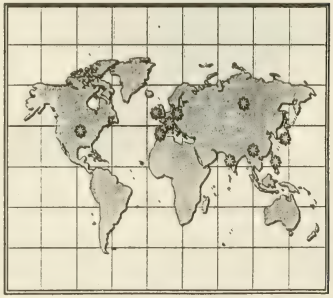
*Funded by U.S. Agency for International Development **Funded under Other Defense Activities appropriation		

Cooperate and Coordinate With Other Departmental Offices And Government Agencies In The Implementation Of U.S.--Non-proliferation Policy

NE is involved with other DOE offices and government agencies in efforts to halt the growing accumulation of fissile material from dismantled nuclear weapons and civilian nuclear energy programs throughout the world. In June 1994, U.S. Vice President Gore and Russian Prime Minister Chernomyrdin agreed to cease operation of Russian plutonium production reactors by the year 2000.

The three remaining Russian plutonium production reactors provide heat and electricity to the communities of Seversk and Zheleznogorsk, and shutdown of these reactors will not be possible until replacement power is available to ensure that energy supplies to these communities are not interrupted. DOE has been leading the efforts to address these replacement power issues, as well as



The growing worldwide accumulation of fissile material from civilian nuclear power programs and dismantled nuclear weapons continues to heighten international concern about nuclear proliferation.

additional nuclear safety and non-proliferation concerns related to breeder reactors in countries of the former Soviet Union. In addition, NE is promoting policies and developing spent fuel management plans to reduce the need for reprocessing nuclear fuel in countries of the former Soviet Union.

DOE also seeks reductions in worldwide inventories of other fissile materials. As part of this initiative, the United States Enrichment Corporation (USEC) is purchasing quantities of Russian low enriched uranium (LEU) that have been derived from highly enriched uranium (HEU) removed from dismantled Russian weapons. In March 1994, U.S. and Russian representatives signed the Protocol on HEU Transparency Arrangements, which governs U.S. access to Russian processing facilities, as well as the Transparency Protocol for Further Arrangements, which establishes how monitoring activities will be conducted at facilities in Russia and the U.S. In September 1994, the first meeting of the U.S.-Russian Transparency Review Committee (TRC) was held to develop detail procedures governing monitoring activities at facilities in both the U.S. and Russia. In July and November 1995, TRC meetings were held to continue procedure development. In accordance with these agreements, DOE is working to increase U.S. confidence that Russian LEU sold to the USEC is derived from HEU removed from dismantled Russian weapons.

Ensure A Reliable Supply Of Medical, Research, and Industrial Isotopes Consistent With Customer Needs

NE manages the Isotope Production and Distribution (IP&D) Program, which produces and sells radioactive and stable isotopes, by-products, surplus materials such as lithium and deuterium, and related isotope services to worldwide markets. Such services include, but are not limited to, irradiation services; target preparation and processing; source encapsulation and other special preparations; analyses and separations; services related to shipping; and processing returned isotopes.

Each year one-third of the 30 million Americans hospitalized are diagnosed or treated with one or more nuclear medicine techniques. Radioactive isotopes are used in more than 36,000 nuclear medicine procedures each day and in 100 million medical laboratory tests each year.

The IP&D Program operates under a revolving fund and maintains financial continuity through its revenues and through payments from the Isotope Support account, which is funded through congressional appropriations. The Isotope Program has two primary missions. The first mission is to produce and distribute certain low-volume radioisotopes and enriched stable isotopes for research and development, medical diagnoses and therapy, and other applications that are in the national interest. The second mission is to produce and distribute high-volume radioisotopes and enriched stable isotopes for medical, industrial, agricultural, and other useful applications on a business-like basis.

Program: Isotope Support

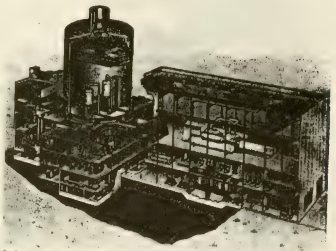
FUNDING PROFILE		
FY 1995	**FY 1996**	**FY 1997**
$ 18.8M	$ 23.1M	$ 11.1M

Support Maintenance Of The Light Water Reactor Option For Domestic Electricity Generation

NE's Light Water Reactor programs cover a broad range of activities designed to ensure the availability of a viable nuclear power plant option to serve the Nation's electric energy requirements in the next century. Program activities are concentrated on achieving Nuclear Regulatory Commission (NRC) certification of evolutionary and Advanced Light Water Reactor (ALWR) plant designs, promoting commercial standardization of plant equipment and systems, and supporting the continued operation of existing nuclear power plants for as long as they are safe, reliable, and economical.

Completing design certification for evolutionary and passive plants requires satisfying the new NRC design certification process provided under Title 10 of the Code of Federal Regulations Part 52, (10 CFR 52), as amended by the Energy Policy Act of 1992, by supporting the first certification of four ALWR designs.

Commercial standardization refers to the First-of-a-Kind Engineering of plant systems and components to enable firm cost estimates and the preparation of construction specifications. To facilitate First-of-a-Kind Engineering leading to commercial standardization, engineering details beyond the level required for NRC design certification are required. Design work is under way to complete such detailed engineering on the General Electric Advanced Boiling Water Reactor and Westinghouse AP-600 designs.



Industry and government are working together to make nuclear power plants a safe, environmentally-sound, and cost-effective energy choice for the 21st century. Standardized, advanced light water reactor designs, featuring state-of-the-art safety systems, will be precertified by the Nuclear Regulatory Commission, and could be available before the end of the decade.

The Department is providing support to industry in its efforts to secure an NRC-issued revised rule for nuclear power plant license renewal. Activities in this area include supporting development of the technical basis for operation of a plant beyond its current license, as well as a demonstration to establish the stability, predictability, and reasonableness of the regulatory process.

In a joint effort with industry and the NRC, DOE is supporting development and demonstration of innovative methods and technologies for repair, refurbishment, and replacement of high maintenance items to reduce overall plant generation costs. To avoid premature plant shutdowns based on performance and economics, public/private partnerships will be established with nuclear utilities to develop new processes to enable utilities to respond effectively to the changing regulatory and economic environment.

Program: Light Water Reactors

FY 1995	**FY 1996**	**FY 1997**
$ 62.8M	$ 40.0M	$ 40.0M

Contribute To The U.S. Nuclear Education Infrastructure

Expertise in the nuclear sciences is vital to many fields, including environmental restoration, medicine, non-proliferation, and basic research. To support our national needs, an increasing number of nuclear engineers, nuclear chemists, health physicists, and other scientific and technical professionals will be required. NE will help ensure the future availability of such nuclear professionals through support to the Nation's universities in the form of:

- , Fellowships for outstanding nuclear engineering and health physics graduates
- Research grants to university nuclear engineering programs that are 50/50 cost-shared with the electric utility industry
- Funding and grants awarded to students at historically black colleges and universities, including development of a cooperative program at Howard University and a chair in the Nuclear Energy department at Morgan State University
- Sponsorship of student exchange programs, teacher workshops, and diversity partnership summer schools

The use of university reactors by neighboring academic institutions for the purpose of scientific research and education is promoted through the Reactor Sharing program; this program also provides for outreach activities by sponsoring facility tours for intermediate and high school students. University reactors are supplied with fresh fuel, and spent fuel is transported away from university facilities through the University Reactor Fuel Assistance program. Grants that help to ensure the operational safety of university research reactor facilities are provided under the Safety and Maintenance Upgrade program.

Maintaining nuclear energy as a future energy option also requires providing the public with accurate, up-to-date information about the benefits and consequences of its use, as well as other, more general considerations. Students, advocates, and other interested members of the public are provided with educational materials to provide needed information and to help them make informed decisions about the use and future of nuclear energy.

A student participating in a summer internship gets some instructions for adjusting the chain reaction taking place in the reactor core.

Provide Compact, Safe Nuclear Power Systems And Related Technologies To Space, National Security, And Other Customers

Radioisotope thermoelectric generators (RTGs) are used to provide electrical power for National Aeronautics and Space Administration (NASA) spacecraft, and to power important national security missions. Similarly, small radioisotope heater units (RHUs) provide heat to keep spacecraft instruments warm in many deep-space missions. RTGs and RHUs are essential to the design of NASA spacecraft, as well as for terrestrial defense missions. Under the Atomic Energy Act of 1954, as amended, and in accordance with congressional appropriations over the last 30 years, DOE has the responsibility to develop and produce such systems for user agencies, and to ensure the safety of these radioactive materials and the devices that use them.

Radioisotope Thermoelectric Generators and Radioisotope Heater Units are proved to NASA by the Department of Energy to satisfy needs for power on space missions such as Galileo and Cassini.

NE manages and operates the laboratory infrastructure needed to fabricate, assemble, and test RTGs, and to buy or produce the Pu-238 fuel used in these power systems.

NE is committed to provide RTGs for NASA's Cassini mission to Saturn. Work is continuing to design, fabricate, and assemble RTGs and RHUs for delivery to NASA for use on the Cassini mission in late 1997.

Program: Advanced Radioisotope Power Systems

$ 59.6M	$ 48.5M	$ 40.0M

Manage NE Facilities And Energy Research Reactors In A Safe, Economical, And Environmentally-Sound Manner

To support its missions, DOE operates research, test, and isotope production facilities. NE is responsible for managing test and research reactors, uranium enrichment facilities not leased by the USEC, several other non-reactor nuclear facilities, and excess uranium and depleted uranium hexafluoride inventories.

NE also manages those activities required to place its unneeded facilities into an industrially and radiologically safe shutdown condition. Major facilities currently in the shutdown phase are the Experimental Breeder Reactor II (EBR-II) at the Argonne National Laboratory-West (ANL-W) site near Idaho Falls, Idaho, and the Fast Flux Test Facility (FFTF) near Hanford, Washington.

Although managed by NE, the Office of Energy Research provides the funding for the operation of its reactors; deactivation of the FFTF is funded by the Office of Environmental Management.

In addition to its reactor facilities, NE manages several non-reactor facilities at ANL-W, including the Fuel Conditioning Facility, the Hot Fuel Examination Facility, and the Analytical Laboratory. These facilities are operated to support the shutdown of the EBR-II and are planned to support the development of techniques for the potential treatment of various DOE spent fuel types.

In addition to activities at the gaseous diffusion plants (GDP) covered under the DOE/USEC Lease Agreement, NE manages numerous other projects at its non-leased facilities. These projects include:

- Managing approximately 560,000 metric tons of depleted uranium hexafluoride stored at the GDPs, including developing a cylinder management strategy, extending cylinder life, and exploring options for the use of depleted uranium
- Safely shutting down HEU production equipment, including removal of HEU-bearing deposits, and continued monitoring of remaining materials to ensure no deposit migration
- Removing HEU materials from the Portsmouth site to reduce security costs
- Re-feeding HEU to blend it into commercially beneficial LEU, thereby reducing safeguards costs at the Portsmouth site after the HEU is removed

NE manages 17 research development, and test facilities to support activities related to energy generation, nuclear science, medical treatments, industrial applications, deep space exploration, waste management, and national defense.

- Supporting the USEC privatization effort by funding nuclear safety upgrades and preparing the NRC Compliance Plan
- Providing cost-effective electrical power to the USEC (electrical contracts were not transferred with the leased facilities)
- Managing environmental corrective actions required as a result of operations conducted prior to the USEC transition date

Develop Advanced Nuclear Technologies to Address High-Priority Challenges

NE is developing technology for treating various spent fuels and mixed wastes within the DOE inventory. The National Academy of Sciences has issued a report entitled, *An Assessment of Continued Research and Development into an Electrometallurgical Approach for Treating DOE Spent* Fuel, which recommends that DOE continue this research and development program.

FUNDING PROFILE

Nuclear Technology R&D	$ 20.6M	$ 25.0M	$ 30.0M

Foster U.S. Industrial Competitiveness Through Technology Transfer and Increased Exports of Nuclear goods and Services

The transfer of new nuclear technologies and research and development data for both nuclear and non-nuclear energy applications is facilitated through partnerships with industry, federal and state agencies, non-profit organizations, and universities. Such partnerships provide an opportunity for the participants to take advantage of the technical expertise available at DOE laboratories and facilities. Technology transfer activities offer the American people innovations that can provide new products, services, and procedures, as well as economic, environmental, health, and other benefits.

NE's program started in 1995 with two Cooperative Research and Development Agreements (CRADAs) signed with industry partners and four CRADAs are planned in 1996. NE is expanding existing technology transfer programs and the number of CRADAs related to membrane and centrifuge technology. Business and market analyses continue to project significant benefits to U.S. industry productivity and the national economy. Early government and industry market projections indicate technology transfer offering new product annual sales could range from $5 million to $25 million over a product life-cycle of 10 to 20 years, resulting in creating new U.S. jobs and enhanced economic growth.

Meet or Exceed National Performance Review Objectives to Make Government More Effective, Efficient, and Responsive

NE is a full participant in efforts to make government less expensive, more efficient and to move the national bureaucracy toward demonstrating greater initiative and empowerment. NE is pursuing several related initiatives, including quality management, training, organizational streamlining, and customer service improvement.

As shown in the accompanying charts, NE will meet or exceed all National Performance Review goals and is well ahead of schedule in doing so.

OFFICE OF NUCLEAR ENERGY, SCIENCE AND TECHNOLOGY
NUCLEAR ENERGY R&D

PROGRAM MISSION

The primary mission of the Nuclear Energy Research and Development program is to enhance the economic and national security interests of the United States, and to increase the safety of commercial nuclear activities.

The GOALS of the Nuclear Energy R&D program are to:

1. Maintain the nuclear energy option into the next century by making a new, safer generation of light water reactors available for the future energy needs of the United States and by resolving life-extension issues associated with existing operating nuclear power plants.

2. Provide compact, safe nuclear power systems and related technologies to NASA and national security customers.

3. Improve the state-of-the-art in nuclear safety technology and improve the safety of nuclear power plants worldwide.

4. Maintain an adequate nuclear industry and education infrastructure.

5. Manage facilities in a safe, environmentally sound, and cost-effective manner.

The OBJECTIVES related to these goals are:

1. Complete design certification for evolutionary and passive plants in cooperation with industry.

2. Support license renewal to extend lifetime of existing plants.

3. Seek and foster collaboration with safety research institutions in the U.S. and worldwide.

4. Provide fuel assistance, fellowship grants, safety upgrade funding, and other assistance to U.S. universities, in cooperation with industry.

The OBJECTIVES related to these goals are - continued

5. Promote cooperation among government, industry, universities and national laboratories to develop valuable personnel, systems, information and technological resources.

6. Meet NE's commitment to NASA to provide Radioisotope Thermoelectric Generators (RTG) and heater units for the Cassini mission to Saturn.

7. Maintain the infrastructure needed to build radioisotope power supplies and, using NASA funding, develop advanced technologies.

8. Manage the research and test reactors and supporting facilities required to meet DOE missions in a safe, economical, and environmentally-sound manner.

9. Support U.S. International Nuclear Safety Center.

PERFORMANCE MEASURES:

1. Complete SSAR design base analysis for AP600 and responses to AP600 Final Safety Evaluation Report.

2. Complete detailed designs for systems to be designed for ABWR first-of-a-kind engineering.

3. Complete fabrication of the three RTGs and 157 Radioisotope Heater Units required for the NASA Cassini Mission and ship them to Kennedy Space Center before launch.

4. Complete the Final Safety Analysis Report for the Cassini Mission RTGs.

5. Provide fellowships to outstanding and promising United States M.S. and Ph.D. students.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

1. Complete verification tests to develop and defend safety analysis in support of safety assessments by NRC for the passive ALWRs.

2. Receive AP-600 final design approval and initiate design certification process.

3. NASA acceptance of three RTGs for NASA Cassini mission.

4. Complete final Safety Analysis Report for Cassini RTGs.

5. NASA acceptance of Cassini RTGs and Radioisotope Heater Units at Kennedy Space Center.

6. Treat EBR-II irradiated fuel assemblies in the Fuel Conditioning Facility to place into a storable form and conduct supporting Analytical Laboratory operations.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS: - continued

7. Continue to operate the TRA Hot Cells to support medical isotope and other programs.

8. Initiate construction for the TRA Fire and Life Safety Improvements.

9. Initiate the irradiation test program at the Advanced Test Reactor in support of the DOE/Monbusho Fusion Energy program.

10. Award fellowships to outstanding and promising United States M.S. and Ph.D. students engaged in nuclear science research and training, ensuring an adequate supply of trained nuclear personnel.

11. Began cooperative projects among U.S., Russian, and Ukrainian international safety centers supported by U.S. national laboratories.

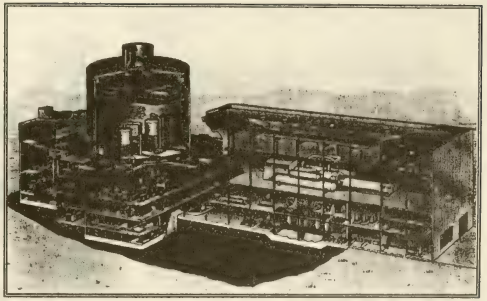
[b]Reflects a $54,000 general reduction.

LIGHT WATER REACTORS
(Dollars in Thousands)

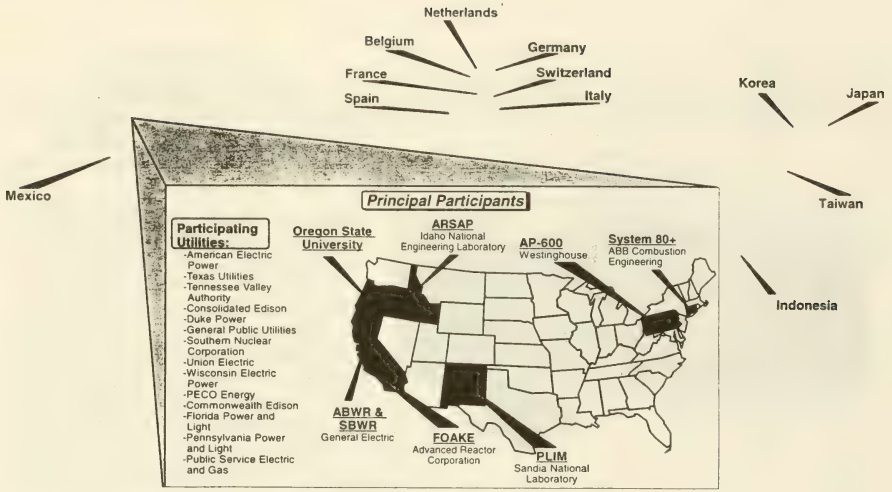
I. Mission Supporting Goals and Objectives

This program is a nationally coordinated effort to meet the goals of elimination of barriers to efficient and cost-effective operation of nuclear powerplants, and maintaining exacting standards of safety in the design and operation of nuclear powerplants. A major focus of this cost-shared program is to make certified standardized Advanced Light Water Reactors (ALWR) available at the earliest possible date to ensure that nuclear power is an option to contribute to the new electrical capacity projected to be required by 2010. The program performs those activities necessary to ensure that ALWR orders can be based on marketplace decisions. It demonstrates a viable Nuclear Regulatory Commission (NRC) process by certification of two advanced evolutionary light water reactor designs. It also develops and certifies the more passively-safe, 600 Mwe plant concepts. This program provides for the continuation of the first-of-a-kind engineering (FOAKE) standardization activities to produce ALWR designs. All of the above activities are being carried out in coordination with the Utilities Nuclear Power Oversight Committee's (NPOC) "Strategic Plan for Building New Nuclear Power Plants."



AP-600 Design:
In FY 1996, Nuclear Energy will provide R&D support to secure NRC certification of evolutionary designs

The Commercial Light Water Reactor program provides technology support to existing U.S. commercial operating nuclear powerplants and to the ALWR Program. It applies the results of the severe accident technology programs to the implementation of the Severe Accident Policy Statement for ALWRs to prevent severe accident issues from forestalling acceptance of ALWRs. It develops technology to support the extension of nuclear powerplant life beyond the current arbitrary 40-year licensing period. It further explores solutions to safety regulatory and other institutional impediments to the deployment and continued operation of nuclear powerplants.



Light Water Reactors Program Participants

089

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Advanced Light Water Reactor	$ 56,831	$ 31,300	$ 30,300	$ -1,000	-3
Commercial Light Water Reactor	6,000	8,700	9,700	1,000	11
TOTAL, Light Water Reactors	**$ 62,831**	**$ 40,000**	**$ 40,000**	**$ 0**	**0**

III. Performance Summary

The ongoing LWR programs are cost-shared equally between utilities, industry and the Department of Energy and involve both domestic and international participants. These programs provide approximately 1,000 jobs for highly skilled professionals located in 20 states.

FY 1995 Accomplishments:

- Continued design certification rulemaking proceedings for the evolutionary ALWRs.
- Continued FOAKE for the selected ALWRs to support commercial standardization.
- Completed verification tests to develop and defend safety analysis in support of safety assessments by NRC for the passive ALWRs.
- Continued severe accident support work for the passive ALWRs Final Design Approvals (FDA).
- Continued interactions with the industry on the technical support to licensing extension with significant effort devoted to R&D in areas of high uncertainty.
- Provided funds for analyses and other information which relate to some of the economic, financial, environmental and regulatory issues facing nuclear energy, in order to ensure that design and technology programs are focused effectively.

FY 1996 Accomplishments (to date and planned):

- Continue FOAKE activities to assure commercial standardization of future commercial powerplants.
- Complete Simplified Boiling Water Reactor (SBWR) testing and analysis in support of licensing topical reports.
- Resolve Draft Safety Evaluation Report open items and requests for information supporting NRC safety assessment for the AP-600.
- Continue severe accident analyses and mitigation measures in support of ALWR certification by NRC.

FY 1996 Accomplishments (to date and planned): - continued

- Continue interactions with industry on the technical support to license extension with use of national laboratory technical expertise in areas of repair, refurbishment and replacement of high maintenance and other license extension areas.
- Provide funds for analyses and other information which relate to some of the economic, financial, environmental and regulatory issues facing nuclear energy in order to ensure that design and technology programs are focused effectively.
- Complete a prototype RPV annealing demonstration to support first commercial RPV anneal.
- Continue material degradation testing and analysis at national laboratories for critical safety component and structures.

FY 1997 Planned Accomplishments:

- Receive AP-600 final design approval and initiate design certification process.
- Complete the ABWR FOAKE program and continue the AP-600 FOAKE program with efforts over 90 percent complete by the end of the year.
- Continue severe accident analyses and mitigation measures in support of ALWR certification by NRC.
- Continue interactions with industry on the technical support to license extension that leads to regulatory and commercial acceptance.
- Provide funds for analyses and other information which relate to some of the economic, financial, environmental and regulatory issues facing nuclear energy in order to ensure that design and technology programs are focused effectively.
- Initiate with industry RPV annealing program that leads to NRC approval for first commercial demonstration.
- Receive ASME approval of code case to support RPV annealing.
- Develop plan for extended fuel burn-up

Explanation of Funding Changes FY 1996 to FY 1997:

With the evolutionary plants nearing completion of design certification, emphasis is shifting to safety and life extension of existing plants.

NUCLEAR ENERGY R&D

ADVANCED REACTOR R&D
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

Consistent with FY 1995 Congressional appropriations, the Advanced Liquid Metal Reactor (ALMR) and the Integral Fast Reactor (IFR)/Actinide Recycle programs were terminated in FY 1995. Required funding was included in the Termination Costs decision unit. Gas Turbine-Modular Helium Reactor (GT-MHR) activities continued in FY 1995.

Congressional action on the FY 1996 budget directed that the GT-MHR program be terminated and required funding was provided in the Termination Cost decision unit.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Gas Turbine-Modular Helium Reactor	$ 10,701	$ 0	$ 0	$ 0	0
Integral Fast Reactor/Actinide Recycle	8,700	0	0	0	0
TOTAL, Advanced Reactor R&D	**$ 19,401**	**$ 0**	**$ 0**	**$ 0**	**0**

683

III. Performance Summary

FY 1995 Accomplishments:

- Continued the GT-MHR design efforts with focus on research and development of fuel and major gas-turbine components. The IFR/Actinide Recycle program was terminated and closeout activities were initiated in October 1994. Funds in this decision unit combined with reprogrammed and transferred funds in the Nuclear Technology Development R&D decision unit were used to redirect the valuable physical and intellectual resources that were previously utilized in the IFR/Actinide Recycle program at ANL-E and ANL-W.

SPACE REACTOR POWER SYSTEMS
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

This activity supported other Federal agencies in the design, development, production, and testing of reactor power systems for space and special purpose terrestrial applications and nuclear reactor propulsion systems for space applications.

Though numerous NASA and DOD applications and some industrial applications have been suggested, no agency or segment of private industry has made a commitment to a space mission using a space reactor system. Therefore, no funding was requested for this activity in FY 1996 or FY 1997. The two recent DOE space reactor power systems development programs, the SP-100 and the DOE thermionic space reactor power system efforts, were closed out in FY 1994. This happened primarily due to changes in customers' mission needs and budget priorities. In FY 1995, DOE funded studies and limited technology development that would be used to support potential NASA, DOD, and commercial missions.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Space Reactor Power Systems	$ 1,154	$ 0	$ 0	$ 0	0
TOTAL, Space Reactor Power Systems	**$ 1,154**	**$ 0**	**$ 0**	**$ 0**	**0**

III. Performance Summary

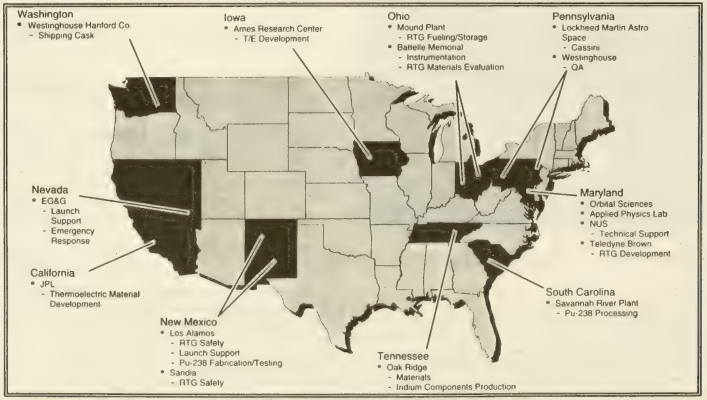
FY 1995 Accomplishments:

- Completed contract closeout activities using prior year funds.
- Using prior year funding, proceeded with examination and disposal of test articles and low level wastes. Provided facility maintenance to satisfy obligations from previous programs.
- Conducted studies on space reactor power and propulsion systems and technology to support NASA, DOD, and commercial interests. Activities included: technical and managerial support to the Air Force nuclear bimodal program; sponsor the archiving of all SP-100 documentation at the Oak Ridge Office of Scientific and Technical Information; and support of research into radiation hardened electronics at the Defense Nuclear Agency and high temperature materials research at Auburn University. Awarded grant to Babcock & Wilcox for the transfer of Russian high temperature fuels technology to the U.S. for potential DOD and NASA interests. Supported United Nations and national policy activities related to space nuclear power.

ADVANCED RADIOISOTOPE POWER SYSTEMS
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

This activity provides support for radioisotope power source development, demonstration, testing, and delivery. Radioisotope power sources are the enabling technology for space and terrestrial applications requiring proven, reliable and maintenance-free power supplies capable of producing up to several kilowatts of power and operating under severe environmental conditions for many years. Previous missions that have used radioisotope power sources include the Apollo lunar surface scientific packages, Pioneer, Viking, Voyager, Galileo, and Ulysses spacecraft.



Advanced Radioisotope Power Systems -- Primary Participants

I. Mission Supporting Goals and Objectives - continued

The Advanced Radioisotope Power Systems program maintains the sole national capability and facilities to produce radioisotope power systems. Program focus is on mission requirements of the National Aeronautics and Space Administration (NASA) and the Department of Defense (DOD). Projects are conducted with these agencies in accordance with Memoranda of Understanding and are dependent upon cost sharing by the user agencies. Support is provided to maintain fabrication and safety testing activities for NASA's Cassini mission, scheduled for launch in late 1997. Delivery of three new radioisotope thermoelectric generators (RTGs) and a requalified existing spare unit to the launch site six months prior to the Cassini launch is required. Production activities for the Cassini RTGs were initiated in FY 1990. Also provided is support for on-going special purpose terrestrial power sources utilized by other Federal agencies. This activity supports the acquisition and processing of the required Plutonium-238 fuel for Cassini and provides an inventory of flight quality Pu-238 for future NASA and DOD missions. This request provides for maintenance of facilities and skilled personnel; modernization and upgrades as required; and provides funding for generic nuclear energy studies, evaluations and safety support.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Radioisotope Thermoelectric Generators	$ 44,510	$ 37,712	$ 35,200	$ -2,512	-7
Special Applications	1,692	1,800	1,800	0	0
Plutonium-238 Acquisition and Processing	13,380	9,000	3,000	-6,000	-67
TOTAL, Advanced Radioisotope Power Systems	**$ 59,582**	**$ 48,512**	**$ 40,000**	**$ -8,512**	**-18**

III. Performance Summary

FY 1995 Accomplishments:

- Completed fabrication and acceptance tests of the first Cassini flight thermoelectric converters.
- Completed encapsulation of 80 fuel pellets for the first of three Cassini RTG heat sources and initiated assembly of General Purpose Heat Source (GPHS) modules.
- Completed reacceptance testing of the Cassini flight spare RTG from the Galileo/Ulysses program.
- Continued safety test program for Cassini mission; issued Updated Safety Analyses Report for the MARS Pathfinder mission; issued Preliminary Safety Analysis Report for the Cassini mission; and supported safety committee reviews required for launch approval.

FY 1995 Accomplishments: - continued

- Completed regulatory tests and continued construction of a new RTG shipping container under new Certificate of Compliance.
- Maintained the Plutonium Fuel Form Fabrication (PuFF) Facility in a safe and environmentally acceptable condition pending transfer.
- Maintained special applications power source capability, including development of a heat source for a 60-watt program.
- Continued Plutonium-238 processing operations in support of Cassini mission and initiated processing of Cassini scrap returns and scrap material remaining in the U.S. inventory to a form suitable for use for future NASA and DOD missions.

FY 1996 Accomplishments (to date and planned):

- Complete fabrication and acceptance testing of the Cassini flight thermoelectric converters.
- Complete encapsulation of 160 fuel pellets for second and third Cassini RTG heat sources.
- Continue assembly of GPHS modules and complete assembly and acceptance testing of the first Cassini RTG; initiate assembly and testing of the second and third RTGs.
- Continue safety test program for Cassini mission, and initiate preparation of the Cassini Final Safety Analysis Report.
- Support safety committee reviews of test program and Safety Analysis Reports required to obtain launch approval for NASA's Cassini and Mars Pathfinder missions.
- Ship heater units for the Mars Pathfinder mission to Kennedy Space Center (KSC) and complete ground operations and emergency preparedness planning activities for the launch in December 1996.

Cassini Mission To Saturn:
In FY 1996, Nuclear Energy will complete the safety analyses for the Cassini mission

- Maintain the PuFF in a safe and environmentally acceptable condition pending transfer to EM.

687

FY 1996 Accomplishments (to date and planned): - continued

- Submit Safety Analysis Report for Packaging for regulatory review for the new shipping container under new Certificate of Compliance.
- Maintain special applications power source capability and continue to support the 60-watt heat source program and testing activities.
- Continue processing Cassini scrap returns and scrap Pu-238 in the U.S. inventory to a form suitable for use for future NASA and DOD missions.

FY 1997 Planned Accomplishments:

- Complete safety test program for Cassini mission and issue Cassini Final Safety Analysis Report.
- Continue to support safety committee reviews of safety test program results and Safety Analysis Reports to obtain Cassini and Mars Pathfinder launch approvals.
- Support ground operations and emergency preparedness activities for the Mars Pathfinder launch scheduled for December 1996.
- Support Cassini ground operations and complete emergency response planning activities at KSC in preparation for the Cassini launch.
- Complete fabrication of new shipping container and obtain Certificate of Compliance.
- Complete RTG assembly and acceptance testing and ship the three new Cassini RTGs and the flight spare RTG to KSC.
- Support RTG checkout and test activities at KSC and prepare to install RTGs on the Cassini spacecraft just prior to launch.
- Continue to operate and maintain essential facilities and program infrastructure in support of Cassini and future NASA missions; maintain the PuFF in a safe and environmentally acceptable condition pending transfer to EM.
- Maintain special applications power source capability and continue to meet user requirements and schedules including the long-term testing requirement for the 60-watt heat source program.
- Initiate efforts to establish the long-term capability and infrastructure to recycle or replenish the useable inventory of Pu-238.

Explanation of Funding Changes FY 1996 to FY 1997:

There will be a decrease of $8,512,000 as the Cassini mission nears completion and the overall program moves toward a facility infrastructure maintenance mode of operation.

FACILITIES
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

Consistent with FY 1995 Congressional appropriations, shutdown of the Experimental Breeder Reactor (EBR-II) has commenced. In FY 1995, funding to prepare the Fuel Conditioning Facility (FCF) and Analytical Laboratory (AL) to support shutdown of the EBR-II by treating irradiated fuel to place into a storable form was included in the Facilities decision unit. However, in FY 1996, Congress appropriated funding for these activities in the Termination Costs decision unit. Funding for FCF and AL operations in FY 1997 is requested in the Termination Costs decision unit.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Facilities	$ 7,013	$ 0	$ 0	$ 0	0
TOTAL, Facilities	**$ 7,013**	**$ 0**	**$ 0**	**$ 0**	**0**

III. Performance Summary

FY 1995 Accomplishments:

- Completed FCF modifications required to treat EBR-II irradiated fuel assemblies to place into a storable form. Completed AL modifications required to perform chemical analysis on radioactive process materials to support FCF operations.

NUCLEAR TECHNOLOGY R&D
(Dollars in Thousands)

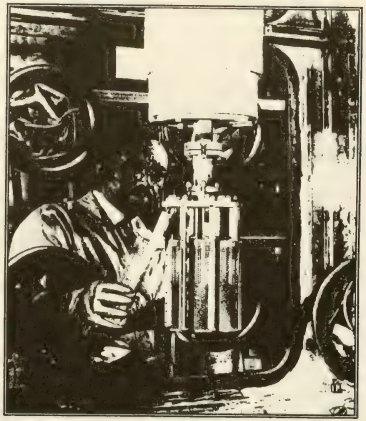
I. Mission Supporting Goals and Objectives

The Nuclear Technology R&D program provides funding to support research and development on technologies supporting high-priority DOE missions, specifically electrometallurgical treatment of DOE spent fuels for safe storage and ultimate disposition and the establishment and operation of an International Nuclear Safety Center.

DOE is responsible for approximately 2,700 metric tons of spent nuclear fuel discharged from DOE reactors and in storage at several DOE sites. A standard, cost-effective means for treating this spent fuel for ultimate disposal is needed, and the electrometallurgical treatment process being developed at Argonne National Laboratory (ANL), which allows treatment of various fuels by one common method, appears to best meet these requirements. This process produces two common high-level waste forms and offers significant cost savings in commonality of process equipment and waste forms. The process has the potential to treat up to 90 percent of DOE's spent nuclear fuel inventory.

The Nuclear Technology R&D program supports the following activities:

- Continued development of high-throughput electrorefiner to support conditioning of EBR-II fuel and blanket elements;
- Continued R&D for treatment of other DOE spent fuel such as Molten Salt Reactor Experiment (MSRE) fuel, eliminating a current storage safety problem;
- Waste treatment R&D and waste form qualification; and
- U.S. International Nuclear Safety Center.



ANL employee working in glovebox with anode assembly for prototype high-throughput electrorefiner. This experimental device is the forerunner of a production -scale electrorefiner capable of treating one ton of DOE spent fuel per day.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Electrometallurgical Treatment of DOE Spent Fuels	$ 15,559	$ 25,000	$ 25,000	$ 0	0
International Nuclear Safety Center	5,000	0	5,000	5,000	100
TOTAL, Nuclear Technology R&D	**$ 20,559**	**$ 25,000**[1]	**$ 30,000**	**$ 5,000**	**20**

III. Performance Summary

FY 1995 Accomplishments:

- Redirected ANL resources utilized on the Integral Fast Reactor (IFR)/Actinide Recycle Program to a higher priority DOE mission. This mission is identified as electrometallurgical R&D for the treatment of DOE spent fuels.
- Supported National Academy of Sciences study evaluating the use of electrometallurgical technologies as a means of treating DOE spent fuels.
- Completed an ANL program plan with a focus on electrometallurgical R&D technology activities.
- Initiated Ukraine Safety and Environmental Research and Development Center with support of U.S. national laboratories.

FY 1996 Accomplishments (to-date and planned):

- Continue electrometallurgical R&D for treatment of Experimental Breeder Reactor II (EBR-II) fuel and other DOE spent fuel types. Complete small-scale experiments (150Kg) using N-reactor fuel.
- Plan waste treatment R&D and waste form qualification to support selection of the preferred waste forms for treated spent DOE fuels.
- Complete physical properties measurement to support core melt experiment design and analysis.
- Complete Risk-Oriented Accident Analysis Methodology (ROAAM) evaluation on in-vessel retention of corium.

691

[1]Funded in Defense Environmental Restoration and Waste Management.

FY 1997 Accomplishments (planned):

- Continue electrometallurgical R&D in support of EBR-II fuel and blanket treatment. Complete process demonstration with two DOE spent fuel types. Initiate experiments on high-speed/high throughput electrorefiner. Fabricate and test full-scale hot metal and mineral waste forms.
- Enhance U.S. laboratory and industry support of international nuclear safety center through cooperative research and development projects, such as diagnostic system monitoring techniques and utilization of RELAP5 codes supporting safety analyses of Russian RBMKs and VVERs.

Explanation of Funding Changes FY 1996 to FY 1997:

Program funding increase is for the operation of an International Safety Center at Argonne National Laboratory.

UNIVERSITY NUCLEAR SCIENCE AND REACTOR SUPPORT
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

The University Nuclear Science and Reactor Support program provides funding for educational and research grants to help maintain a stable human resource base in the nuclear sciences. The program also provides funding towards maintaining university reactors used for scientific research, education, and training. The nuclear sciences are an important contributor to the expanding environmental restoration , health, medicine, and research areas, as well as to traditional nuclear energy areas. Specific elements of the program include: university reactor fuel assistance, university reactor safety maintenance assistance, conversion of university reactors from highly enriched uranium (HEU) to low enrichment uranium (LEU) fuel cores, the DOE/Utility Matching Grants program, the University Reactor Sharing program, Historically Black Colleges and Universities (HBCU) and the Nuclear Engineering /Health Physics (NE & HP) Fellowship program.

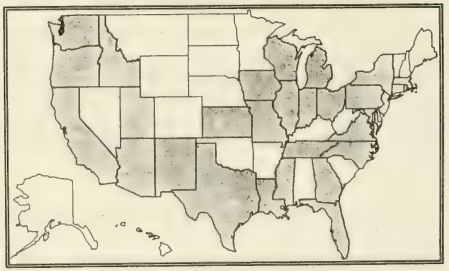
Program Participants



States with Participating Universities

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
University Nuclear Science and Reactor Support	$3,505[1]	$ 3,500[1]	$ 6,950	$ 3,450	99

III. Performance Summary

FY 1995 Accomplishments:

- Developed and implemented university reactor fuel supply and HEU to LEU fuel conversion plan; continued reactor refuelings and spent fuel shipments and HEU to LEU conversions.
- Continue third year of DOE/utility matching grants program and provided grants to 17 universities. Continued university reactor sharing programs with 28 universities.
- Developed university reactor safety maintenance and upgrade plan.
- Provided financial assistance to 18 engineering students at 8 different Historically Black Colleges and Universities.

FY 1996 Accomplishments (to date and planned):

- Provide fellowships for 22 outstanding and promising United States M.S. and Ph.D. students engaged in nuclear science research and training at 9 different universities.
- Provide financial assistance to 18 engineering students at 8 different Historically Black Colleges and Universities.
- Supply fresh fuel for 8 university reactors and complete conversion of Georgia Tech reactor from HEU to LEU.
- Establish a faculty position to teach engineering to students from Morgan State, Coppin State, and Bowie State.
- Continue fourth year of DOE/utility matching grants program and provide grants to 17 universities.
- Begin implementation of university safety maintenance and upgrade plan.

[1]An additional $2,170,000 in FY 1995 and $1,000,000 in FY 1996 were made available from several Nuclear Energy Research and Development programs to support HBCU's and NE & HP fellowships.

FY 1997 Accomplishments:

- Provide fellowships for 22 outstanding and promising United States M.S. and Ph.D. students engaged in nuclear science research and training.
- Provide financial assistance to 18 engineering students at Historically Black Colleges and Universities.
- Continue to provide financial assistance for a faculty position to teach engineering to students from Morgan State, Coppin State, and Bowie State.
- Continue reactor refuelings and spent fuel shipments and HEU to LEU conversions.
- Complete last year of DOE/utility matching grants program. Evaluate continuation of program based on review of accomplishments, utility interest and available funds.
- Continue university reactor maintenance and safety upgrades.

Explanation of Funding Changes FY 1996 to FY 1997:

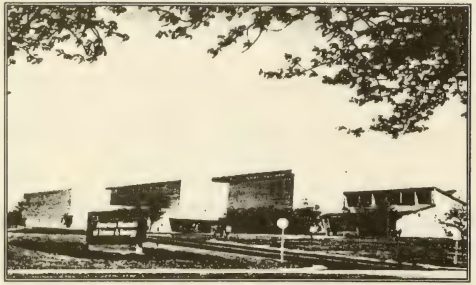
A review of recently updated university reactor maintenance surveys disclosed the need for selected improvements such as replacing or repairing reactor safety control channels, reactor control consoles, primary heat removal systems, safety and central rod drive systems and upgrading area radiation monitoring equipment. Funding for these activities was not available in FY 1996, therefore new funds are being requested.

In addition, during FY 1996, the Historically Black Colleges and Universities program was funded by prior year carryover funds available from later than anticipated awards of financial assistance agreements. These funds are not available to continue these activities in FY 1997 and new funds are being requested.

OAK RIDGE LANDLORD
($ in Thousands)

I. Mission Supporting Goals and Objectives

Oak Ridge Landlord provides for centralized Oak Ridge Operations Office (ORO) infrastructure requirements and general operating costs for those activities outside plant fences of the Oak Ridge National Laboratory (ORNL), the Y-12 Plant, and the K-25 Plant. Activities include environmental, safety and health (ES&H), and quality assurance facility compliance activities; ES&H upgrades of facilities at the Water Plant, which provides potable water for the Y-12 and ORNL Plants, as well as for the City of Oak Ridge; training and development activities; support to the Directives Management Group; technology development support to small and small disadvantaged businesses; maintenance of roads and grounds; operation of the American Museum of Science and Energy; operation of the Emergency Operations Center (EOC), which is responsible for emergency management at ORO; payment-in-lieu-of-taxes due to the local community; physical security; the ORO Financial Center Activities; and litigation expenses incurred by former DOE Management and Operation contractors.



American Museum of Science and Energy

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Operating	$ 9,988	$ 12,100	$ 12,100	$ 0	0
Capital Equipment	1,981	1,500	1,500	0	0
Construction	2,255	800	2,400	1,600	200
TOTAL, Oak Ridge Landlord	**$ 14,224**	**$ 14,400**	**$ 16,000**	**$ 1,600**	**11**

III. Performance Summary

FY 1995 Accomplishments:

- Continued operation of the American Museum of Science and Energy, which annually hosts an average of 200,000 visitors from all 50 states and from many foreign countries, and houses over 200 interactive exhibits.
- Continued ES&H upgrades to the Water Plant as required in order for water quality requirements mandated by the state and the EPA to be met. The Water Plant provides potable water to DOE facilities as well as the City of Oak Ridge. Also, completed design of control systems and performed seismic upgrades at the Water Plant.
- Coordinated emergency response activities for DOE/ORO operations and emergency support to the local area, both state and region.
- Continued inspection and maintenance of the Oak Ridge Reservation roads and grounds including 22 miles of paved roads and associated rights-of-way, 32 cemeteries, and 4 bridges.
- Developed training programs for employees; oversight of contractor training, and the performance of training and qualification surveillances per DOE Orders, and Defense Nuclear Facilities Safety Board (DNFSB) commitments.
- Provided information for the President's Advisory Committee Report on Human Radiation Experimentation (HRE).
- Began the renovation of office space to house MK-Ferguson employees.

FY 1996 Accomplishments (to date and planned):

- Continue operation of the Museum and the EOC and continued inspection and maintenance of roads and grounds.
- Continue ES&H upgrades at the Water Plant and other DOE-owned facilities including HVAC systems, sprinkler systems, restroom facilities, the establishment of areas to accommodate the storage and reuse of tools that are within tolerable contamination limits to reduce costs associated with decontamination and replacement.
- Identification, packaging, and shipment of documents relating to HRE to the National Archives for permanent storage.
- Continue to provide documentation to litigants in suits relating to HRE, as well as continued large-scale declassification efforts.
- Implement the ORO Financial Center to enable the consolidation of various accounting functions in FY 1997.

FY 1996 Accomplishments (to date and planned): - continued

- Continue responses to DNFSB recommendations involving the directives management, training and development, emergency management, and ES&H activities.
- The first quarter's payment of payment-in-lieu-of-taxes, which is effective October 1, 1995.
- Water Plant Controls Modernization, Phase I - Design for controls and instrumentation at the main treatment building site of the Water Plant.
- Payment of litigation expenses for class action lawsuits filed against former DOE Management and Operating (M&O) contractors.

FY 1997 Accomplishments:

- Continuation of ongoing activities identified above, with the exception of HRE activities.
- Payment of the calendar year 1996 payment-in-lieu-of-taxes, which renders financial assistance to state and local governments on DOE lands.
- Upgrade of the air-conditioning system and the removal of asbestos containing materials duct work at DOE-owned facilities.
- Consolidation of various accounting functions in various DOE offices to the ORO Financial Center.

Explanation of Funding Changes FY 1996 to FY 1997:

Construction - The increase of $1,600,000 will provide for upgrade of air conditioning system and removal of asbestos containing material ductwork at DOE owned facilities, and for seismic upgrades at the Water Plant to resolve the seismic stability problem near the 4 million gallon reservoir.

TRA LANDLORD
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

Test Reactor Area (TRA) Landlord activities include operating support, equipment procurement, General Plant Projects (GPP), and Line Item Capital Projects (LICP) to ensure the safety and reliability of TRA site facilities.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
TRA Landlord	$ 3,951	$ 3,900	$ 4,000	$ 100	3
TOTAL, TRA Landlord	**$ 3,951**	**$ 3,900**	**$ 4,000**	**$ 100**	**3**

III. Performance Summary

FY 1995 Accomplishments:

- Conducted landlord operating support activities including planning, readiness reviews, training, and system operational testing of landlord funded GPP and LICP projects at TRA.
- Corrected Environment, Safety and Health (ES&H) deficiencies identified during inspections and self-assessments. GPP funding supported TRA site activities.
- Provided surveillance and maintenance of spent nuclear fuel storage areas.
- Commenced Title II Design for the TRA Fire and Life Safety Improvements.
- Fire and Life Safety Improvements at TRA include replacement of deficient fire barriers and addition of automatic fire suppression systems to meet applicable codes, modification of existing Heating, Ventilation, and Air Conditioning systems, expansion of fire detection systems, and addition of a redundant fire water supply.

669

FY 1996 Accomplishments (to date and planned):

- Conduct landlord operating support activities including planning, readiness reviews, training, and system operational testing of landlord funded GPP and LICP projects at TRA.
- Correct ES&H deficiencies identified during inspections and self-assessments.
- Complete Title II Design for the TRA Fire and Life Safety Improvements.

FY 1997 Accomplishments:

- Conduct landlord operating support activities including planning, readiness reviews, training, and system operational testing of landlord funded GPP and LICP projects at TRA.
- Correct ES&H deficiencies identified during inspections and self-assessments.
- Initiate construction for the TRA Fire and Life Safety Improvements.

Explanation of Funding Changes FY 1996 to FY 1997:

An increase of $100,000 in FY 1997 will enable the program to meet minimum maintenance and site upgrade requirements.

1999	5,425	0	5,425	5,900

[1] Reflects Adjusted Appropriation after distribution of general reduction within the Office of Nuclear Energy, Science and Technology.

1. Title and location of project: TRA Fire and Life Safety Improvements Idaho National Engineering Laboratory, Idaho

2a. Project No.: 95-E-201
2b. Construction Funded

8. Project Description, Justification and Scope:

The Test Reactor Area (TRA) Fire and Safety Improvements project provides for the design, procurement, and construction activities to correct fire protection and life safety code deficiencies at the TRA. Corrections consist of:

a) Modifications to or replacement of deficient fire barriers to meet code and reduce Maximum Possible Fire Loss (MPFL) or smoke damage impacts to property and personnel.

b) Additions, modifications, or new automatic fire suppression systems to meet code requirements for operations personnel life safety and to reduce Maximum Credible Fire Loss (MCFL) potentials to acceptable improved risk levels as required by DOE Order 5480.7.

c) Additions or modifications to existing building heating and ventilating systems to control fire and smoke spread, upgrades or replacement of interior doors to provide smoke and fire barriers, protection of structural support members, and sealing of penetrations in fire barriers (existing walls and floors) to provide effective control of property damage and life safety protection.

d) Modifications and expansions of the fire detection and alarm system and removal of obsolete equipment to meet codes, site-wide system compatibility, monitoring and life safety requirements.

e) Addition of fully redundant water supply, consisting of new UL-listed and FM-approved fire pumps and a tank capable of delivering 100 percent of the highest demand for volume, pressure, and duration to meet reliability requirements of DOE Order 5480.7.

This project provides for design, procurement, and construction activities to correct fire protection and life safety code deficiencies at the TRA. Fire protection is a part of the Idaho National Engineering Laboratory (INEL) site-wide safety program to provide a safe working and operating environment. The corrections to be provided by the project are required to bring systems and facilities into compliance with fire and life safety requirements of the DOE regulations and national codes and standards. Numerous fire protection and life safety deficiencies have been identified during the current and ongoing appraisals conducted by DOE-Idaho Operations Office and Lockheed Martin Idaho Technologies contractor fire protection personnel.

Buildings constructed prior to current National Fire Protection Agency (NFPA), Uniform Building Code (UBC), and Life Safety Codes and Standards require upgrades to provide fire suppression systems, fire walls in corridors, stairwells, new exits and upgrades to existing exits, installation of fire separation walls and smoke dampers, and installation of new and upgrade of existing fire alarm and detection systems.

1. Title and location of project: TRA Fire and Life Safety Improvements, Idaho National Engineering Laboratory, Idaho

2a. Project No.: 95-E-201
2b. Construction Funded

8. Project Description, Justification and Scope (continued):

Modifications and upgrades to existing fire protection systems, installation of new systems, and upgrades to existing facilities will bring occupied TRA facilities in compliance with national codes and standards and DOE regulations.

9. Details of cost estimate:

		Item Cost	Total Costs
a.	Design and Management Costs		$ 4,645
	(1) Engineering, design and inspection at approximately 19% of construction costs, Item c.d (Design, Drawings, and Specifications: $830	$1,655	
	(2) Construction management	1,420	
	(3) Project Administration	1,570	
b.	Land and land rights		
c.	Construction costs		8,710
	(1) Improvements to land (Grading, paving, and drainage)	110	
	(2) Buildings (New Pump House and modifications to a number of existing facilities)	4,500	
	(3) Other structures (New 1,000,000 gal Water Storage Tank)	1,600	
	(4) Utilities (Fire Water Lines and Power for and alarms for new/existing buildings and structures)	2,500	
	(5) Special Facilities	0	
d.	Standard Equipment		11
e.	Major computer items		0
f.	Removal costs less salvage		0
g.	Design and project liaison, testing, checkout and acceptance		0
	Subtotal		$13,366

1. Title and location of project: TRA Fire and Life Safety Improvements, Idaho National Engineering Laboratory, Idaho

2a. Project No.: 95-E-201
2b. Construction Funded

11. Schedule of project funding and other related funding requirements (continued):

b. Related Annual Costs

(1)	Total facility operating costs	$ 1
(2)	Facility maintenance and repair costs	0
(3)	Programmatic operating expenses directly related to the facility	10
(4)	Capital equipment not related to construction but related to the programmatic effort in the facility	0
(5)	GPP or other construction related to the programmatic effort in the facility	0
(6)	Utility Costs	0
(7)	Other Costs	0
	Total related annual funding	$ 11

12. Narrative explanation of total project funding and other funding requirements:

a. Total Project Costs

(1) Total facility cost - The total facility cost is based upon the conceptual design that was completed in February 1992 with schedule and escalation revised in December 1992. The Conceptual Design Cost Estimate was prepared utilizing the INEL Cost Estimating Manual and DOE Order 5700.2C.

(a) Line item - Narrative not required.

(b) Operating Expenses funded equipment - Narrative not required.

(c) Inventories - Narrative not required.

13. Design and Construction of Federal Facilities:

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, OMB Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards," section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6. The project will be located in an area not subject to flooding determined in accordance with Executive Order 11988.

ATR FUSION IRRADIATIONS
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

This activity provides for the planned transfer of irradiations in support of the Department of Energy/Monbusho Fusion Energy program to the Advanced Test Reactor (ATR). This program was being conducted in the Fast Flux Test Facility when it was placed in standby on April 1, 1992. The DOE/Monbusho irradiations were subsequently planned for transfer to the Experimental Breeder Reactor (EBR-II) for completion. With the shutdown of EBR-II, the irradiation programs are being transferred to the ATR.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
ATR Fusion Irradiations	$ 2,340	$ 2,303	$ 800	$ -1,503	-65
TOTAL, ATR Fusion Irradiations	**$ 2,340**	**$ 2,303**	**$ 800**	**$ -1,503**	**-65**

III. Performance Summary

FY 1995 Accomplishments:

- Provided funding for the planned transfer of the fusion irradiation program to ATR. Activities included design of an irradiation test assembly for the program.

FY 1996 Accomplishments (to date and planned):

- Continue design of the irradiation test assembly for the fusion irradiation program.

FY 1997 Accomplishments:

- Resume design and initiate fabrication of the irradiation test assembly required to conduct the fusion irradiation program in the ATR. Fabrication, installation and testing will be completed by the end of FY 1998 when fusion materials irradiations are scheduled to begin. Funding for the actual experiment irradiations will be provided by the Office of Energy Research.

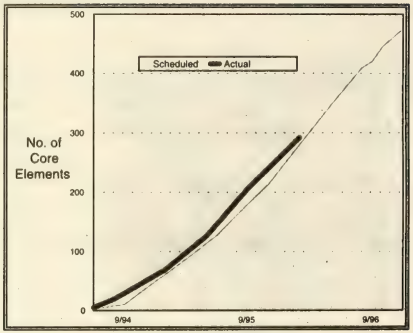
Explanation of Funding Changes FY 1996 to FY 1997:

Based on schedule changes in the Office of Energy Research's fusion program, $1,400,000 of the FY 1996 appropriation was available and used to offset a Congressionally mandated general reduction. Therefore, the actual programmatic reduction between FY 1996 and FY 1997 is $103,000. This reduction is consistent with the revised testing schedule.

OFFICE OF NUCLEAR ENERGY, SCIENCE AND TECHNOLOGY
TERMINATION COSTS

PROGRAM MISSION

The Termination Costs program provides funding to conduct the activities necessary to terminate the Gas-Turbine Modular Helium Reactor (GT-MHR) program and to place unneeded Office of Nuclear Energy, Science and Technology (NE) facilities into an industrially and radiologically safe shutdown condition. Shutdown activities are currently underway at the Experimental Breeder Reactor II (EBR-II) and other surplus facilities at the Argonne National Laboratory-West (ANL-W) site near Idaho Falls, Idaho. The shutdown provides for defueling the EBR-II core; draining the sodium coolant from EBR-II; sealing the EBR-II primary and secondary cooling systems; treating the EBR-II spent fuel and blanket subassemblies; and processing the EBR-II and other sodium in the Sodium Processing Facility.



EBR-II Defueling Schedule
In FY 1996, remove 214 core elements from the EBR-II Reactor.

The GOALS of the Termination Costs program are to:

1. Deactivate the GT-MHR program facilities and provide for associated costs.

2. Place the EBR-II and other surplus facilities into an industrially and radiologically safe shutdown condition by the end of FY 1998.

The OBJECTIVES related to these goals are:

1. Shutdown surplus facilities in cooperation with other government entities.

2. Manage the safe storage, processing, and, in coordination with the Office of Environmental Management (EM), the disposition of spent fuel and waste materials.

3. Place surplus facilities into a safe shutdown condition requiring minimum surveillance and maintenance; transfer facilities to EM for further decontamination and decommissioning, environmental restoration or other appropriate disposition.

PERFORMANCE MEASURES:

- Complete EBR-II defueling by the end of the first quarter of FY 1997.
- Complete GT-MHR program termination in FY 1997.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- In FY 1995, EBR-II operation at ANL-W was ceased and shutdown was initiated in October 1994. Shutdown activities include defueling of EBR-II, manufacturing and insertion of dummy subassemblies, and FCF modifications to enable treatment of spent fuel and blankets to place into a storable form.
- Shutdown of TREAT at ANL-W was initiated in FY 1995 and will be completed in FY 1996.
- In FY 1996, defueling of EBR-II and preparations to treat spent fuel are continuing.
- In FY 1996, prepare Environmental Assessment covering the proposed demonstration of electrometallurgical technology for treating EBR-II spent fuel and blankets.
- In FY 1997, complete EBR-II defueling; initiate treatment of EBR-II sodium in the Sodium Processing Facility, and demonstrate treatment of fuel and blankets in the FCF.
- In FY 1998, complete shutdown of EBR-II and other unneeded ANL-W facilities, including the treatment of sodium; and continue the fuel treatment demonstration.
- Surplus facilities transferred to EM in FY 1996 include the Tower Shielding Facility and the Integrated Process Demonstration Facility (IPDF) at ORNL, and the Power Burst Facility and the Advanced Reactivity Measurements Facility/Coupled Fast Reactivity Measurements Facility at INEL.
- Termination of the GT-MHR program was initiated in FY 1996.

714

III. Performance Summary

FY 1995 Accomplishments:

- During FY 1995, permanent shutdown of the EBR-II was initiated on October 1, 1994. The FCF was modified and prepared for electrometallurgical treatment of EBR-II fuel and blankets to place in a suitable form for long term storage. Conceptual design was completed on the Sodium Processing Facility (SPF).

- Surveillance and maintenance activities necessary to maintain the Tower Shielding Facility (TSF) at ORNL and the Power Burst Facility (PBF) and the Advanced Reactivity Measurements Facility/Coupled Fast Reactivity Measurements Facility (ARMF/CFRMF) at INEL in safe shutdown conditions were performed.

- Surveillance and maintenance activities necessary to maintain the IPDF at ORNL in a safe shutdown condition were performed. Shipment of in-process materials off-site was initiated and remaining materials were prepared for transfer to an off-site facility.

- Procure and install equipment to support the shutdown. Conduct GPP to support site activities. Initiate modifications to the Sodium Processing Facility. Perform required maintenance and upgrades on the EBR-II fuel handling system required for shutdown activities.

FY 1996 Accomplishments (to date and planned):

- Complete EBR-II blanket assembly removal. Complete construction of the modified SPF. Treat EBR-II fuel assemblies in the FCF.

- Transfer TSF and IPDF at ORNL and the PBF and the ARMF/CFRMF at INEL to EM.

- Procure and install equipment to support the shutdown. Conduct GPP to support site activities. Complete modification of the Sodium Processing Facility.

- Initiate GT-MHR termination.

FY 1997 Accomplishments:

- Complete defueling of the EBR-II and continue treatment of EBR-II driver fuel in the FCF. Initiate treatment of blanket assemblies in the FCF. Process Fermi reactor sodium and initiate processing of EBR-II secondary system sodium.

- Procure and install equipment to support the shutdown. Conduct GPP to support site activities. Perform upgrades to the Hot Fuel Examination Facility required to prepare fuel and blanket assemblies for treatment. Modify the EBR-II primary and secondary sodium systems to permit draining and closure of the systems.

- Complete GT-MHR termination.

Explanation of Funding Changes FY 1996 to FY 1997:

Program is continuing at effectively the same level.

716

NUCLEAR ENERGY R&D
PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities

As a result of substantial reductions in staffing and other administrative expenses, separate Policy and Management and Program Direction accounts have been eliminated and a single Program Direction account is being established in FY 1997 for the Office of Nuclear Energy, Science and Technology. The Program Direction account supports Headquarters and Operations Office personnel providing technical direction to Nuclear Energy Research and Development activities, as well as energy research reactor operations (which are funded by the Office of Energy Research), the shutdown of the Fast Flux Test Facility (FFTF) (which is funded in the Environmental Management (EM) non-defense account), the high priority U. S. Government program which provides reactor safety assistance to Russia, Ukraine, and the Central and Eastern European countries (which is funded in the Other Defense Activities Appropriation) and activities funded by other Federal agencies, the nuclear industry and foreign governments. This activity also includes funding for administrative expenses, such as: training, computer support, including hardware and software acquisitions, modifications, and other telecommunications services for work stations. In FY 1997 a Working Capital Fund is being established to provide funding for common administrative services, such as rent and utilities, provided by the Department's central administrative offices. Previously, these costs were included in the DOE's Departmental Administration Appropriation.

III. Performance Summary

FY 1995 Measurable Performance Activities:

Completed second year of NE Headquarters streamlining and downsizing. Overall NE accomplishments (from FY 1993 baseline) which include all Program Direction activities are:

- Reducing Headquarters staff from 258 to 148 (41 percent reduction)
- Reducing the number of senior executive positions from 22 to 7 (68 percent reduction)
- Increasing employee to supervisor ratio from 2:1 to 10:1
- Reducing reliance on support service contracts by 38 percent
- Reducing the number of support service contractors occupying NE office space by 50 percent (from 24 to 12)

FY 1996 Measurable Performance Activities:

The key benchmarks by which NE will measure its FY 1996 streamlining performance are:

- Reducing Headquarters staff to 139
- Reducing senior executive positions to six
- Increasing the employee to supervisor ratio to 11:1
- Reducing travel by 20 percent from FY 1995 level
- Reducing reliance on support service contracts by 15 percent from FY 1995 level

720

FY 1997 Measurable Performance Activities:

The key benchmarks by which NE will measure its FY 1997 streamlining performance are:

- Reducing Headquarters staff to 123 (a 52 percent reduction since 1993)
- Increasing the employee to supervisor ratio to 12:1
- Reducing senior executive positions to five
- Reducing reliance on support service contractors by 15 percent from FY 1995 level

IV. Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $657,000 for program direction primarily results from the reduction in Headquarters staffing and other related expenses. This reduction was partially offset by one time costs associated with retirement buyout payments and an increase in the estimate for the working capital fund established to allocate funding to Departmental Elements for common administrative services, such as rent and utilities, provided by the Department's central administrative office.

V. Explanation of Average FTE Costs:

The average employee costs are based on detailed calculations of employee salary costs (adjusted for escalation), benefits (life insurance, Medicare, and retirement), and other personnel compensation (such as awards and overtime). The average costs per employee does not include other expenses such as the working capital fund and travel, since this has been centrally budgeted for all NE Headquarters employees. The average employee costs are calculated using the midpoint of beginning of year and end of year staffing levels.

The overall average NE Headquarters employee salary and benefits cost is $95,000. The average NE Headquarters Nuclear Energy R&D employee salary and benefits cost is $96,000. The variance is negligible.

The overall average NE Field employee salary and benefits cost is $91,000. The average NE Field Nuclear Energy R&D employee salary and benefits cost is $95,000. The variance is negligible.

The average "fully loaded" employee costs are to include an allocation of expenses for rent, utilities, telecommunications, materials and supplies, etc., as well as salaries and benefits. These costs, for Headquarters and Field employees, are shown below:

Cost Category	Average per Headquarters Employee	Average per Field Employee
Salary and Benefits	95	91
Travel	7	5
Rent and Utilities	6	-
Contract Audits	3	-
ADP Support	3	-
Other Expenses	6	17
Total Average	120	113

- Does not include:
  - support services costs which are predominantly funded by program operating expenses;
  - travel by other federal agency employees (e.g., State Department travel related to transparency measures program activities);
  - other expenses not related to federal staffing (e.g., funding for New Brunswick Laboratory employees related to transparency measures monitoring activities in Russia); and
  - retirement "buyout" payments and related expenses.

OFFICE OF NUCLEAR ENERGY, SCIENCE AND TECHNOLOGY
ISOTOPE SUPPORT

PROGRAM MISSION

The Isotope Support decision unit will fund a payment into the Isotope Production and Distribution (IP&D) program to assure adequate supplies of isotopes necessary for the national interest, and for supporting our health care system. Specifically, requested funding is to maintain financial continuity of radioactive and stable isotope production, processing, distribution, and associated services to commercial and research customers. Funding will also be used to support radioisotopes and enriched stable isotopes for research or development, medical diagnosis and therapy, other applications in the national interest, calutron operations to replenish inventories, funding for the TRA Hot Cells at the Idaho National Engineering Laboratory, and administrative activities. Additionally, the Department is studying the possibility of producing Molybdenum-99 (Mo-99), an isotope used in over 36,000 medical procedures per day in the U.S. The U.S. supply currently depends on a single aging reactor in Canada and the U.S. medical community has expressed serious concern about the reliability of supply. The decision whether to produce Mo-99 will be made after the Record of Decision of the Environmental Impact Statement currently underway.

The GOAL of the Isotope Support program is to:

Provide financial viability of the IP&D program.

ISOTOPE SUPPORT
(Dollars in Thousands)

I. Mission Supporting Goals and Objective

The Department, through the IP&D program, provides radioactive and stable isotope products and associated services to a wide and varied domestic and international market. Ultimate applications of isotopes products include medical research and health care, industrial research and manufacturing, education, and national defense. The IP&D program has two primary missions. The first mission is to produce and distribute certain low-volume radioisotopes and enriched stable isotopes for research and development, medical diagnoses and therapy, and other applications that are in the national interest. The second mission is to produce and distribute high-volume radioisotopes and enriched stable isotopes that have profit potential for medical, industrial, and other useful applications on a business-like basis.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Isotope Production & Distribution	18,810	23,078	11,124[1]	-11,954	-52
Program Direction	2,065	1,580	1,580	0	0
TOTAL, Isotope Support	**$ 20,875**	**$ 24,658**	**$ 12,704**	**$ -11,954**	**-48**

III. Performance Summary

FY 1995 Accomplishments:

- Completed the environmental evaluation as part of the National Environmental Protection Act process for Mo-99 initiative.
- Restarted calutrons at Oak Ridge to provide essential medical and research isotopes.
- Executed five isotope CRADAs for advancing isotope production and processing techniques.
- Achieved gross profit of more than 10 percent.

[1] This line item includes the Department activity to establish a domestic source of Mo-99; additional funds will be provided within the overall DOE budget pending the conclusion of the Environmental Impact Statement during the Spring of 1996.

FY 1995 Accomplishments: - continued

- Increased revenues by 15 percent.
- Achieved 90 percent on-time deliveries.
- Provided for continued study of Mo-99 initiative, including environmental evaluation and process validation.
- Maintained financial viability of the IP&D program through its revenues and the Isotope Support decision unit.
- Assured an adequate supply of isotopes to be used for medical diagnoses and therapy, other applications in the national interest, calutron operations to replenish inventories, and administrative activities.

FY 1996 Accomplishments (to date and planned):

- Determine whether to produce Mo-99, pending result of the Environmental Impact Statement.
- Achieve 95 percent on-time deliveries.
- Achieve gross profit of 12 percent.
- Increase overall revenues from isotope sales by 5 percent (if some DOE production facilities are privatized, DOE's share of revenues will decrease).
- Maintains financial viability of the IP&D program.
- Assures an adequate supply of isotopes to be used for medical diagnoses and therapy, other applications in the national interest, calutron operations to replenish inventories, and administrative activities.

FY 1997 Accomplishments:

- Obtain Food and Drug Administration (FDA) approval for domestic Mo-99 production, if initiative is pursued.
- Plan and fund prioritized process development projects.
- Achieve gross profit by 15 percent.

FY 1997 Accomplishments: - continued

- Stabilize revenues.
- Continue calutron operations for the production of stable isotopes.
- Assure an adequate supply of isotopes to be used for medical diagnoses and therapy, other applications in the national interest, calutron operations to replenish inventories, and administrative activities.

ISOTOPE SUPPORT
PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities

The Program Direction account supports salaries, benefits, travel, and miscellaneous supplies or services to Headquarters and Operations Office personnel providing technical direction to the Office of Isotope Production and Distribution. This activity also includes funding for administrative expenses, such as: training, computer support, including hardware and software acquisitions, modifications, and other telecommunications services for workstations.

II. Funding Table

III. Performance Summary

FY 1995 Measurable Performance Activities:

Completed second year of NE Headquarters streamlining and downsizing. Overall NE accomplishments (from FY 1993 baseline) which include all Program Direction activities are:

- Reducing Headquarters staff from 258 to 148 (41 percent reduction)
- Reducing the number of senior executive positions from 22 to 7 (68 percent reduction)
- Increasing employee to supervisor ratio from 2:1 to 10:1
- Reducing reliance on support service contracts by 38 percent
- Reducing the number of support service contractors occupying NE office space by 50 percent (from 24 to 12)

FY 1996 Measurable Performance Activities:

The key benchmarks by which NE will measure its FY 1996 streamlining performance are:

- Reducing Headquarters staff to 139
- Reducing senior executive positions to six
- Increasing the employee to supervisor ratio to 11:1
- Reducing travel by 20 percent from FY 1995 level
- Reducing reliance on support service contracts by 15 percent from FY 1995 level

FY 1997 Measurable Performance Activities:

The key benchmarks by which NE will measure its FY 1997 streamlining performance are:

- Reducing Headquarters staff to 123 (a 52 percent reduction since 1993)
- Increasing the employee to supervisor ratio to 12:1

FY 1997 Measurable Performance Activities: - continued

- Reducing senior executive positions to five
- Reducing reliance on support service contractors by 15 percent from FY 1995 level

IV. Explanation of Funding Changes FY 1996 to FY 1997:

No change in funding.

V. Explanation of Average FTE Costs:

The average employee costs are based on detailed calculations of employee salary costs (adjusted for escalation), benefits (life insurance, Medicare, and retirement), and other personnel compensation (such as awards and overtime). The average costs per employee does not include other expenses such as the working capital fund and travel, since this has been centrally budgeted for all NE Headquarters employees.

The overall average NE Headquarters employee salary and benefits cost is $95,000. The average NE Headquarters Isotope employee salary and benefits cost is $96,000. The variance is negligible.

The overall average NE Field employee salary and benefits cost is $91,000. There is only one NE Isotope Field employee and the salary and benefits cost is $130,000. The variance is attributable to only one Isotope Field employee which precludes any lower average cost attributable to lower paid employees.

The average "fully loaded" employee costs are to include an allocation of expenses for rent, utilities, telecommunications, materials and supplies, etc., as well as salaries and benefits. These costs, for Headquarters and Field employees, are shown below:

Cost Category	Average per Headquarters Employee	Average per Field Employee
Salary and Benefits	95	91
Travel	7	5
Rent and Utilities	6	-
Contract Audits	3	-
ADP Support	3	-
Other Expenses	6	17
Total Average	120	113

- Does not include:
  -support services costs which are predominantly funded by program operating expenses;
  -travel by other federal agency employees (e.g., State Department travel related to transparency measures program activities);
  -other expenses not related to federal staffing (e.g., funding for New Brunswick Laboratory employees related to transparency measures monitoring activities in Russia); and
  -retirement "buyout" payments and related expenses.

Civilian Waste Research and Development

OFFICE OF CIVILIAN RADIOACTIVE WASTE MANAGEMENT

I. Mission Supporting Goals and Objectives

The primary goals of this activity are: to complete cooperative demonstrations with industry and the electric utilities to develop transportable storage system and dry transfer system that the Nuclear Regulatory Commission (NRC) may license for use at utility or interim storage facilities.

Generic research and development (R&D) is used to support studies to describe the behavior of spent fuel in long-term dry storage and establish a data base which will assist in the licensing of dry storage technologies. Headquarters staff is responsible for the assessment of technical progress, project planning, milestone progress, guidance, overview and integration of all contractor activities.

Spent fuel storage provides for full monitoring and periodic assessments of casks at the Idaho National Engineering Laboratory (INEL) loaded with intact and consolidated fuel; generic research and development of information and reports on technical subjects important to the design, licensing, operation and maintenance of spent fuel storage facilities; international information exchanges; and support of a transportable storage system and dry fuel transfer system.

The FY 1996 Energy Supply, Research and Development Appropriation provides no funding for this program. The Office of Civilian Radioactive Waste Management is using existing funds to terminate research projects in a orderly manner and attempt to transfer custody of the spent nuclear fuel to other programs within the Department of Energy.

II. Funding Schedule

	FY 1995	FY 1996	FY 1997	$ Change	% Change
Spent fuel Storage Development					
Cooperative Agreements					
Dry Cask Storage	279				
Generic Research	273				
Cooperation with Non-Nuclear States	20				
Program Direction	110				
Total, Civilian Radioactive Waste Research and Development.	682	0	0	0	0

III. Performance Summary

FY 1995 Accomplishments

Completed Draft Design of DOE /Electric Power Research Power Institute (EPRI) dry transfer system.
Initiated Fabrication of DOE / Sacramento Municipal Utility District (SMUD) transportable storage system.

FY 1996 Planned Accomplishments

No new initiatives, existing projects will be closed out.

FY 1997 Objectives

No new initiatives, existing projects will be closed out.

FY 1997 Planned Accomplishments

None.

Explanation of Funding Changes FY 1996 to FY 1997

Program terminated by the FY 1996 Energy Supply, Research and Development Appropriation.

Major Issues

Availability to research information from monitoring spent fuel in dry storage at the Idaho National Engineering Laboratory will be lost when this program is terminated. This fuel has been in casked dry storage longer than any other fuel in the United States, therefore this termination will result in a unique lost scientific opportunity.

FY 1997 CONGRESSIONAL BUDGET REQUEST

ENVIRONMENT, SAFETY AND HEALTH

EXECUTIVE BUDGET SUMMARY

Mission:
The Office of Environment, Safety and Health (EH) works with line program managers to develop tools needed to manage safety at our facilities more effectively and at less cost to taxpayers. The Office has demonstrated that the Department can do its work better, more safely, and at less cost by integrating safety into the planning and execution of work. Safety is no longer viewed as an "add-on" that produces only paper and needless cost, but as an asset that allows efficient targeting of the most urgent risks, most efficient use of limited resources, and effective accomplishment of work.

The EH independent oversight program has been extremely useful in helping the Department effectively target risk. Comprehensive assessments provide DOE management with validated, professional appraisals of the site's performance, greatly aiding its ability to target resources to areas of greatest risk to workers, the public, and the environment. The foundation of the new approach is an analytic framework or "template" that clearly articulates the principles and operational elements of sound ES&H management programs. The template allows assessments to be based on clearly defined principles and performance expectations and not just on inspector's view.

744

The Office of Environment, Safety and Health (EH) is a corporate resource that fosters Departmental excellence through innovative leadership in the protection of workers, the public, and the environment. This commitment to excellence will be demonstrated by striving for continuous improvement in developing meaningful programs and policies; conducting independent oversight of environment, safety, and health performance; and providing technical resources, assistance, and information sharing domestically and abroad. Open communication, participation, and performance feedback on EH activities from relevant parties are integral to EH's success. EH seeks to ensure that Department of Energy (DOE) activities are conducted in a way that prevents accidents or injuries to workers and the public, and prevents harm to the environment. As the equivalent of a "corporate resource" for DOE, EH is the major source of expertise in disciplines such as environmental protection, nuclear safety engineering, public health, industrial hygiene, radiation protection, construction safety, risk management, epidemiology, and occupational medicine. Our goal is to leverage our resources and skills in a way that provides DOE's line management programs with the tools it needs to protect workers, the public, and the environment at DOE sites.

This goal takes on increasing urgency and complexity as DOE faces unprecedented hazards at its facilities, especially in the nuclear weapons complex. As a result of more than 50 years of nuclear weapons production and the rather sudden end of the Cold War, DOE harbors the largest

inventories of hazardous materials in the world outside of the former Soviet Union. Much of this material -- plutonium, spent fuel, and hazardous chemicals -- is stored in aging and deteriorating facilities, and in conditions and buildings that are in themselves hazards to workers. We lack reliable data for many of these facilities on the most basic issues, such as electrical and ventilation systems. DOE is also transitioning to new missions of weapons dismantlement, environmental cleanup, and decontamination and decommissioning. These newer tasks challenge DOE workers with highly dynamic and changing workplaces, where hazards are numerous and varied and exposures are unknown and unpredictable.

The overall major goals and objectives include the following.

Goal 1: Establish a standardized corporate independent oversight process that provides a credible process for appraising the effectiveness of environment, safety, health, and safeguards and security programs throughout DOE. To accomplish the goal of corporate independent oversight, the following objectives have been established: (a) identify, prioritize, and target Departmental needs for independent oversight; (b) incorporate the DOE's safety management guiding principles into all oversight activities; (c) institutionalize a coordinated and consistent independent oversight for the DOE; and (d) disseminate lessons learned to reinforce good practices of work planning, hazard analysis, and hazard control.

Goal 2: Establish a quality (timely, efficient, and effective) assistance program. To accomplish this technical assistance goal, the following objectives have been established: (a) establish management structure and supporting systems to achieve an effective technical assistance program; (b) identify potential environment, safety, and health assistance needs; (c) establish a priority-setting system for processing requests for assistance and delivering quality environment, safety, and health assistance; (d) continuously improve technical assistance through feedback; and (e) develop an outreach plan and program for technical assistance.

Goal 3: Develop an effective system of policies, rules, orders, and standards. To accomplish this policy/standards goal, the following objectives have been developed: (a) identify policy, requirements, guidance, and standards in existing environment, safety, and health orders; (b) develop a framework for order restructuring; (c) integrate orders' component parts into new environment, safety, and health orders system; and (d) implement a process to assess and improve the effectiveness of the new environment, safety, and health order system in protecting the environment and enhancing public and worker safety and health.

Goal 4: Establish a National Environmental Policy Act (NEPA) process that encourages managers to use NEPA, builds public trust, and minimizes cost and preparation/review time. To accomplish this NEPA goal, EH has established the following objectives: (a) implement NEPA contract reforms that provide incentives for quality and timely performance; (b) implement changes to improve the NEPA process; (c) implement additional reforms for high priority projects to deal with situations where schedule is of paramount importance; (d) implement enhancements for public involvement to encourage and facilitate public participation throughout the NEPA process; and (e) form a quality team to analyze the environmental impact statement process and recommend improvements.

Goal 5: Improve environment, safety, and health performance and management accountability by leading DOE-wide implementation of environment, safety, and health business and budget planning processes. To accomplish this goal, EH has established the following objectives: (a) develop and support implementation of a DOE-wide environment, safety, and health budget and planning process that defines scope, identifies costs, prioritizes activities based on relative risk, and allocates resources against established commitments in a visible manner for implementation of environment, safety, and health program activities; (b) improve environment, safety, and health performance through the application of total quality approaches to environment, safety, and health management processes; and (c) integrate environment, safety, and health in all Departmental business functions.

Goal 6: Establish an integrated information management program. To accomplish this goal, EH's objectives are: (a) formalize the information management function; (b) provide quality environment, safety, and health information to the public, EH, DOE, and other stakeholders; (c) provide users effective communication, sharing, and processing of quality information; and (d) continuously improve management of information.

Goal 7: Carry out EH's mission in an open, trustworthy, and responsive manner. To accomplish this goal, EH's objectives are: (a) establish and implement programs that strengthen the public's trust, confidence, and respect in and for EH; (b) establish and implement programs that strengthen the credibility and trust of EH by Departmental and contractor employees; and (c) support the Department's efforts in the reduction of national security information and to minimize future classification.

EH is modeled after private corporations with the best environment, safety, and health records. Based on the premise that systems that effectively manage environment, safety, and health are also the key to improving the cost-effectiveness and efficiency of work, EH develops management systems for the line programs that proactively identify and efficiently cope with hazards before they cause accidents, disease, or environmental contamination.

746

The legal requirements that affect the activities of the EH organization include all environmental, safety, and health Federal regulations, as well as legislation such as the National Defense Authorization Act for Fiscal Year 1995.

Strategy:
EH's intent is to assure that quality, objectivity, responsiveness and innovation are hallmarks of all EH activities. In addressing EH's future posture and direction, planning began by identifying and capitalizing on current strengths and proceeding toward accomplishment of well-defined goals and objectives. EH focuses on developing management-level analytical products, reducing redundancies in DOE, and enhancing staff development. Since EH is the Departmental advocate for excellence in programs to protect the environment, as well as the health and safety of workers at DOE facilities and the public, EH serves its principal customers in the following major areas: (a) the development and establishment of environmental, safety, and health policies and rules for operation of Departmental facilities that are effective, and efficient; (b) conduct of independent oversight activities that provide a comprehensive status of environment, safety, health, and safeguards and security performance at

DOE facilities; and (c) technical assistance to the Department's programs to foster the identification and resolution of environment, safety, and health issues.

Major Changes:
The Office of Environment, Safety and Health (EH) works with line program managers to develop tools needed to manage safety at our facilities more effectively and at less cost to taxpayers. The Office has demonstrated that the Department can do its work, better, more safely, and at less cost by integrating safety into planning and execution of work. Safety is no longer viewed as an "add-on" that produces only paper and needless cost, but as an asset that allows efficient targeting of the most urgent risks, most efficient use of limited resources, and effective accomplishment of work. At Fernald, for example, the Department avoided nearly $2 million in costs by recognizing and avoiding unnecessary work. Safety personnel worked side by side with engineers, planners, and other workers to "build in" safety and health concerns into the actual planning of work. In much the same way, $500,000 was saved at a facility at the Hanford plant. This approach to work planning is to become standard practice throughout the DOE complex and will continue to save taxpayers millions of dollars year after year while also making work safer.

Vulnerability assessments led by the Office of EH identified conditions or weaknesses in the way we handle spent fuel, plutonium and hazardous chemicals that could affect the public or worker health or the environment. These analyses have allowed the Department to better set priorities and direct resources toward the most urgent risks. Overall, 281 of 503 corrective actions identified in the spent fuel report have been completed and 64 of 152 plutonium milestones have been met. For example, at the Hanford K-basins, actions were developed and will soon be implemented to remediate what were identified as the highest spent fuel risks in the complex. At Savannah River, the FB-Line and F-Canyons are operating and stabilizing plutonium solutions.

747

A critical challenge today in DOE is doing new types of work and doing it at facilities that are no longer in sync with the Department's rules and orders. These "top down" orders were developed to meet the needs of a stable weapons production system. Decontamination, decommissioning, and environmental cleanup, on the other hand, involved hundreds of individual tasks in aging facilities with hazards that are unknown and difficult to predict. Many old, poorly-maintained buildings don't meet today's building codes and safety standards. The "Necessary and Sufficient Process" provides a graded approach to safety standards that allow us to tailor the standards to the work and the facilities. In a pilot application of this process at a major Hanford facility, we were able to greatly reduce worker exposure while cutting costs by 50 percent. The Department plans to use this process to proceed with safe and timely stabilization of facilities at Rocky Flats and other locations throughout the DOE complex.

The EH independent oversight program has been extremely useful in helping the Department effectively target risk. Comprehensive assessments providing DOE management with validated, professional appraisal of the site's performance, greatly aiding its ability to target resources to areas of greatest risk to workers, the public, and the environment. The foundation of the new approach is an analytic framework or "template" that clearly articulates the principles and operational elements of sound ES&H management programs. The template allows assessments to be based on clearly defined principles and performance expectations and not just one inspector's view. In December 1994, EH was reorganized along core

functional areas. The independent oversight of environment, safety, health, and safeguards and security activities were placed in one organization. Technical Assistance and Policy functions were also realigned. Health Studies encompass all the International Programs including Marshall Islands, as well as Occupational Medicine, and Epidemiologic Studies. This realignment assists EH in streamlining and providing the Department with a smaller, more technically adroit and more flexible EH organization.

In FY 1997, the budget structure of EH is changed to reflect the major business lines identified in its strategic plan. These business lines are Technical Assistance, Oversight, Policy, Health Studies, Radiation Effects Research Foundation program, NEPA, and Management and Administration, and they are divided into two major accounts (Non-Defense and Defense). Each account also has a Program Direction Decision Unit. Separation of these functions provides for avoidance of conflict of interest, as delineated in the Secretary's response to Section 3163 of the Fiscal Year 1995 National Defense Authorization Act. For example, the staff conducting oversight activities will be independent of both line management and technical assistance efforts and will be free of conflicts of interest that would compromise independence. Also, oversight funded in Other Defense Activities is not responsible for policy. The non-defense activities encompass technical assistance and policy operations, therefore providing for clear separation of functions along appropriation accounts as well as business lines.

Finally, savings in the EH program have been realized from reduced use of support services, improved productivity from Federal workforce, and reorganization along business lines that eliminated redundancies and refocused programs on prevention and providing practical, timely information to managers. Support service contracts have been reduced and consolidated from FY 1995 to FY 1997. FTEs were at 452 in FY 1995 and will be reduced to 422 in FY 1997. Travel expenditures will be reduced by approximately 20 percent from FY 1995 to FY 1997.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ENERGY SUPPLY, RESEARCH AND DEVELOPMENT
(Tabular dollars in thousands)
ENVIRONMENT, SAFETY AND HEALTH
EH NON-DEFENSE
PROGRAM MISSION

The Office of Environment, Safety and Health (EH) is a corporate resource that provides leadership and Departmental management excellence to protect the workers, the public, and the environment. This commitment to excellence is demonstrated by striving for continuous improvement to develop meaningful programs and policies and providing technical assistance, resources, and information sharing. Open communication, participation, and performance feedback on EH activities from affected parties is integral to EH's success. The hallmark and highest priority of all EH activities is daily excellence in the protection of the workers, the public, and the environment. Program Direction is a separate Decision Unit in the Energy Supply, Research and Development Appropriation. As part of the reorganization of the Office of Environment, Safety and Health, operations were streamlined along business function activities. Accordingly, in order to streamline budget activities, the Energy Supply, Research and Development (which prior activities were Environment, Safety and Health activities and Nuclear Safety Policy) now encompass these business lines: Technical Assistance, Policy, Health Studies, National Environmental Policy Act (NEPA), Radiation Effects Research Foundation (RERF), and Management and Administration. The activities performed by these business lines are as follows:

TECHNICAL ASSISTANCE: These activities comprise a range of corporate-based functions in support of key Departmental missions to address emerging program vulnerabilities, significant or new nuclear and industrial hazards, and improved methods for managing or implementing programs. Also, support is provided to: crosscutting Department of Energy (DOE)-wide functions, which ensure the quality of environment, safety, and health monitoring; safety and health protection of Federal employees; programs for strengthening safety performance; and communications of environment, safety, and health program guidance and practices. Overall activities focus on safety and health of workers and the public, safety of the environment and Federal facilities, and prevention and/or mitigation of effects of unforeseen occurrences.

POLICY: These activities include developing, interpreting, promulgating, and maintaining coherent and comprehensive requirements, guidance, and technical standards for protecting workers, the public, and the environment. These activities also consist of liaison and information exchange with other agencies, committees, governmental bodies, and industry and public interest groups on nuclear and industrial safety and environmental policies and standards.

NATIONAL ENVIRONMENTAL POLICY ACT (NEPA): This is a process that enhances managers' decision-making, builds public trust, and minimizes the cost and time for document preparation and review while maintaining quality.

RADIATION EFFECTS RESEARCH FOUNDATION (RERF): This program conducts research and studies for peaceful purposes on the medical effects of radiation on man or diseases that may be affected by radiation, with a view to contributing to the maintenance of the health and welfare of atomic bomb survivors and to the enhancement of the health of all mankind.

MANAGEMENT AND ADMINISTRATION: These activities provide for the centralized management and direction of EH for the Department wide business and budget planning process, budgeting, financial control, procurement, information management, and technical training and professional development.

The **GOALS** of EH **Non-Defense** programs are:

- To conduct technical assistance programs and activities that consistently provide quality, timely, efficient, and effective environment, safety, and health assistance that meets priority needs and receives high customer satisfaction.
- To have an effective system of policies, requirements, guidance, and technical standards that significantly increase the protection of the environment and enhance public and worker safety and health.
- To effectively implement the NEPA process and foster public trust.
- To establish and maintain a Department-wide business and budget planning process that identifies environment, safety, and health vulnerabilities and enables effective line program allocation of environment, safety, and health resources.
- To establish and maintain an integrated information management program that will enhance environment, safety, and health performances.
- To improve the performance and effectiveness of the Department's workforce and contractor employees in matters related to environment, safety, and health.

The **OBJECTIVES** related to these goals are:

- Identify environment, safety, and health needs and assist management in action plan development; and develop environment, safety, and health program guidance for nuclear and industrial safety and environmental and health protection.
- Provide specialized technical assistance to line management to address facility and personnel safety issues; identify *necessary and sufficient* guidelines for the work being performed; and provide exchange of operating experience and lessons learned.
- Support programs to improve exposure assessment and medical monitoring of the DOE workforce.
- Identify policy, requirements, guidance, and standards in existing environment, safety, and health directives, and integrate directives' component parts into a new environment, safety, and health directive system, and into a standard-based safety management system.
- Review Safety Analysis Reports (SARs) and Environmental Impact Statements, risk analysis, and operational analyses.
- Implement environment, safety, and health contract reforms that provide incentives for quality and timely performance, and encourage innovative contracting approaches.
- Ensure the completion of timely and adequate NEPA reviews.
- Ensure the consistency and quality of NEPA documents and increase the efficiency of NEPA personnel.
- Streamline the environmental review process.
- Support the implementation of a DOE-wide environment, safety, and health budget and planning process.
- Improve the information management function by enhancing the ability to provide quality environment, safety, and health information to the public, EH, DOE, and other stakeholders.
- Transition to standards-based safety: radiological facilities separated from nuclear facilities and graded approach applied to enhance facility safety; moving from prescriptive compliance-based approach to performance-oriented approach.
- Ensure that EH personnel receive necessary and comprehensive training to perform their assigned duties.

757

- Investigate the effects of radiation exposure on the survivors of the bombings of Hiroshima and Nagasaki.

PERFORMANCE MEASURES:

The performance measures related to environment, safety, and health activities are primarily qualitative rather then quantitative. Some performance measures are:

- Reduced worker health and safety impacts; no fatalities and fewer serious injuries; fewer instances of significant worker exposures; and lower overall total exposures to radiological and toxicological materials.
- Fewer radiological and toxicological contamination events, fewer abnormal operating events, and fewer procedural violations.
- Environment, Safety and Health performance trends will improve (e.g., decreased lost workdays due to occupational illness, injury; decreased number of personnel contaminated with radionuclides).
- The number of serious accidents where policy is a root cause of the problem will decrease.
- Former workers are satisfied that issues surrounding their potential for occupationally-related disease are being addressed.
- Timely resolution of identified deficiencies and concerns associated with the operations of DOE occupational medical programs.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

Significant accomplishments and program shifts are defined within the respective business line descriptions that follow.

[3]EH Non-Defense is a new decision unit as a result of the EH Budget Structure Changes. See the Environment, Safety and Health Executive Budget Summary comparability matrixes.

Program Performance Summary:

Mission Supporting Goals and Objectives

Technical assistance within EH consists of the following:

Line Management Support focuses on safety and health programs that are often unique to DOE and its mix of radioactive, hazardous, and toxic materials through the demonstration of effective business practices, and direct program assistance and guidance to DOE field offices and contractors. These include activities relating to design, construction, operation, and decontamination and decommissioning of nuclear weapons production and research-related facilities; identification and medical monitoring of high-risk exposure groups of workers; construction safety; work planning techniques to identify, evaluate, and eliminate hazards; and identification of technologies and innovative adaptations of existing practices. Included in this area is support to line management in developing *necessary and sufficient* environment, safety and health requirements and continuation of Departmental Standards Committee initiatives.

Environment, Safety and Health Guidance program supports the development of interpretations and guidance documents for safety and health issues and for the environmental requirements of the Clean Air Act, the Clean Water and Safe Drinking Water Acts, Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), Superfund Amendments and Reauthorization Act (SARA), Emergency Planning and Community Right to Know Act (EPCRA), and Radioactive Waste and Hazardous Substance Acts. Also, the program consists of mandatory corporate environmental reporting.

Interagency Representation funds the monitoring of emerging environmental regulations that affect DOE operations and current laws (e.g., the Atomic Energy Act, the Clean Air Act, and the Pollution Prevention Act). This area also includes developing a corporate infrastructure as appropriate for the movement to external regulation.

Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Line Management Support	$29,494	$29,255	$24,095	$-5,160	18%
Environment, Safety & Health Guidance	2,500	2,500	2,500	0	0
Interagency Representation	2,425	2,425	2,625	+ 200	8%
Total Technical Assistance	$34,419	$34,180	$29,220	$-4,960	14%

Performance Summary

FY 1995 Accomplishments

- Developed guidance manuals for Occupational Health and Safety and Worker Safety.
- Issued "The Manual of Functions, Assignments and Responsibilities".
- Developed model program guidance for decontamination and decommissioning of DOE's surplus facilities.
- Issued guides on hazards associated with handling and storage of hazardous and toxic materials.
- Developed construction safety performance measures.
- Coordinated with Environmental Protection Agency (EPA) the development of a Memorandum of Understanding for implementation of 40 Code of Federal Regulations (CFR) 61 and obtained EPA's approval for a monitoring protocol that demonstrates compliance with the regulation.

- Developed guidance for implementation of DOE protection requirements from the hazards of radiation (e.g. 10 CFR 834) and provided assistance for requirements implementation of control and recycle of residual radioactive material and radioactive waste management.
- Consolidated DOE Orders and Rules and streamlined environment, safety and health requirements.
- Issued lessons-learned analyses to the DOE complex in the form of an Operating Experience publication.
- Performed a complex-wide evaluation of environment, safety and health vulnerabilities involved with the storage and handling of plutonium, spent fuel, and hazardous chemicals.
- Provided technical support for the Department's management plan to correct vulnerabilities.
- Provided technical support to Interagency Nuclear Safety Review Panel for its review of the safety analyses of the Cassini Mission to Saturn and the Mars Pathfinder Mission.
- Published "Medical Guidelines for Firefighters," which reconciles the National Fire Protection Association Standards with the Americans with Disabilities Act.
- Integrated contractor occupational medicine program requirements into comprehensive worker protection management for DOE Federal and contractor employees.
- Developed a cost-benefit process enabling line management to evaluate the cost effectiveness of on-site Contractor Occupational Medicine programs versus other alternatives.
- Provided corporate accreditation services for radiation dosimeters and biomedical assay programs of line offices.

764

FY 1996 Accomplishments (to date and planned)

- Develop field test guidance for hazardous waste operations and emergency response during cleanup and restoration actions.
- Develop hazards analysis, prevention criteria, and a model program that focuses on worker safety and health with regard to new technologies being developed for environmental restoration and waste management activities.

- Complete development of model program guidance for deactivation and decommissioning.
- Complete development and assistance in implementation of *necessary and sufficient* guidelines.
- Conduct, with line organizations, environment, safety and health vulnerability assessments, and assist in action plan development and implementation.
- Develop enhanced work-planning program guidance focusing on medical surveillance for current workers.
- Recommend applications of new nuclear materials technologies for activities such as plutonium packaging and storage; stabilization, processing, and interim storage techniques for spent nuclear fuels; and tritium handling.
- Implement process for the cost effectiveness of on-site contractor occupational medicine programs versus other alternatives.
- Develop and implement a corporate infrastructure to support movement to external regulation, as necessary.
- Continue to develop DOE positions on emerging environmental regulations. Potential reauthorizations of Resource Conservation and Recovery Act (RCRA), the Clean Air Act, the Clean Water Act, and others will result in significant regulatory activity by the EPA.
- Publish a revision of 10 CFR 1046, "Medical Guidelines for Protective Force Personnel."
- Complete the quality model for programs in occupational medicine settings.
- Provide medical standards to be included in the Personnel Security Assurance Program.
- Conduct Highly Enriched Uranium Study.

765

FY 1997 Planned Accomplishments

Line Management Support ($24.1 million)

- Provide assistance to line programs for implementation of guidance for hazardous waste operations and emergency response.

- Field test model program and guidance for hazards evaluation and accident/exposure prevention and mitigation for workers and other personnel associated with new and emerging technologies for environmental restoration and waste management.
- Field test model program guidance for decommissioning and decontamination/construction safety.
- Provide technical assistance on *necessary and sufficient* guidelines to line offices as necessary.
- Conduct, with line organizations, environment, safety, and health vulnerability assessments, and assist in action plan development and implementation.
- Provide aviation safety assistance to line management.
- Manage the DOE dam safety program, the Interagency Nuclear Safety Review Panel, and support DOD reactor evaluations.
- Field test enhanced work planning program guidance focusing on medical surveillance of current workers.
- Provide technical assistance as needed with hazards analysis of large-scale processes for handling and storage of hazardous and toxic chemicals.
- Recommend applications of new technologies for the protection, safety and health of the public, workers, and facilities, and for mitigation or prevention of accidents and damage.
- Provide corporate accreditation services for radiation dosimeters and biomedical assay programs of line offices.
- Implement enhanced work planning by institutionalizing site-specific exposure and medical monitoring programs.
- Provide occupational medicine expert consultation and specific studies to resolve deficiencies and concerns associated with the operation of DOE Occupational Medicine Programs.
- Develop medical surveillance model program guidance for current workers.
- Assist DOE with the Radiation Emergency Assistance Center/Training Site (REAC/TS) that provides DOE with a national and international 24-hour capability for evaluating and managing victims of radiation accidents occurring at DOE facilities or among the public.

- Complete research projects associated with improved treatment of high-dose-radiation accident victims and provide expert consultation and assistance for radiation-accident-patient management.

- Issue DOE-wide interpretation and guidance documents to assist in implementing environmental requirements.

- Conduct the nuclear and facilities safety Operating Experience Analysis Feedback program including managing the occurrence reporting system (ORPS), performance indicators, and issuance of operating experience summaries (OEWS).

- Provide radiological protection management technical assistance.

- Gather data across DOE and provide technical assistance for corporate environmental reporting.

- Administer corporate Voluntary Protection Program (VPP) at DOE field sites, including application reviews and onsite evaluations. Assist the field in implementing process safety management.

- Provide technical assistance for 18,000 Federal DOE employees for OSH protection per Federal statute.

- Provide specialized nuclear safety engineering assistance to participate on multidisciplinary operations office or program office teams, readiness reviews, or consult with line managers to address safety issues for nuclear facilities.

- Conduct DOE certification reviews for packaging and transportation of nuclear materials including WIPP acceptance criteria and onsite assistance (this program is being transferred to Environmental Management (EM)). ($4.3 million)

Environment, Safety and Health Guidance ($2.5 million)

- Provide assistance to line management to develop and implement necessary and sufficient sets of Environment, Safety and Health Requirements and continue Departmental Standards Committee initiatives.

- Issue DOE-wide interpretation and guidance documents (i.e., guides, information briefs, handbooks) and to program and field offices to assist in implementing environmental requirements in the following areas; Clean Air Act, Water Acts (Clean Water, Safe Drinking Water), Waste Cleanup Acts (CERCLA, EPCRA, SARA), Radioactive Waste Acts, Hazardous Substance Acts, Pollution Prevention Act, and Cultural Resource Management.

Interagency Representation ($2.6 million)

- Provide corporate environmental expert assistance to line management on matters such as ground-water protection programs, the phaseout of ozone-depleting substances, the reduction of toxic chemical releases, and RCRA and CERCLA remedial actions. Develop DOE position

on emerging environmental regulatory requirements.

- Develop and implement a corporate infrastructure to support movement to external nuclear regulations. OSHA/NIOSH interface and transition to external regulation.

Explanation of Funding Changes FY 1996 to FY 1997

Technical assistance is reduced in the amount of $4,960,000 by streamlining contractor support in the following areas:

- Field-test guidance ("templates") on application of Hazardous Waste Operations and Emergency Response (HAZWOPER) during DOE hazardous waste activities.
- Radiological protection visits.
- Evaluation of new nuclear material technologies.
- Environment, Safety and Health vulnerability assessments, along with assistance in management action plans.
- Specialized nuclear safety training (evaluation training, criticality safety, and transportation and packaging analysis).
- Efforts to improve the Occurrence Reporting and Processing System and the Performance Indicators program.
- Re-engineering of line management support in Occupational Medicine.
- Accreditation of DOE dosimeter laboratory measurement programs.
- Radiation Emergency Accident Center Training Site Support.
- Environmental Compliance.
- The process for defining, describing, and documenting recordkeeping and recording requirements for worker health and safety completed.

Program Performance Summary:

Mission Supporting Goals and Objectives

Policy program activities provide for operation of the Technical Standards Program in compliance with the Office of Management and Budget (OMB) Circular A-119. The activities also provide DOE with the corporate capability to develop and issue environmental policy, when needed because of events or new requirements pertinent to new legislation, regulations, or Executive Orders, or to protect the public and the environment when a deficiency in programs or operations is identified. Also provided is the capability to develop, promulgate, interpret, and maintain policy, requirements, guidance, and technical standards, including a standards-based safety management program, to implement the nuclear safety program.

Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Policy	$2,560	$2,600	$2,340	-$260	10%

Performance Summary

FY 1995 Accomplishments

- Developed 10 CFR 834, which contains requirements to protect the public and the environment from radioactivity resulting from DOE's activities.
- Updated, streamlined, and consolidated DOE Environmental Orders into a single Environmental Protection Program Order.
- Provided technical and environmental policy advice to activities revising the Department's waste management Orders and issued policy statements for radiation protection and low-level radioactive waste.
- Issued 10 CFR 830, "Nuclear Safety Management," for further public comments.
- Consolidated Facility Safety into a single DOE Order.
- Developed infrastructure for integrated standards-based safety management system.

FY 1996 Accomplishments (to date and planned)

- Issue rule 10 CFR 834.
- Develop implementation plans for 10 CFR 834 and 830.
- Review and update policies in Environmental Protection Program Order as required.
- Provide environmental policy advice on Department's waste management Order and issue policy statements on radiation protection low-level radioactive waste as required.
- Issue New Facility Safety Order.
- Convert DOE technical standards to national/international consensus standards.

770

FY 1997 Planned Accomplishments

- Provide environmental policy advice and interpretations on DOE's rule on radiation standards for the protection of the public and the environment. ($0.14 million)

- Develop and issue Nuclear Safety requirements (8 Price-Anderson Amendment Act (PAAA) rules and 2 orders), technical standards, provide interpretation of requirements, and continue management of DOE Technical Standards Program. ($2.2 million)

Explanation of Funding Changes FY 1996 to FY 1997

- Rule and order promulgated and issued in FY 1996 on radiation standards for the protection of the public and the environment (10 CRF 834) and activities on the environmental protection program to be funded at a reduced level for interpretations, advice, and implementation. ($-260,000)

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET
ENVIRONMENT, SAFETY AND HEALTH
EH NON-DEFENSE
NATIONAL ENVIRONMENTAL POLICY ACT

Program Performance Summary:

Mission Supporting Goals and Objectives

The NEPA program serves as a corporate resource that supports the timely implementation of the Department's proposed activities by assuring compliance with the National Environmental Policy Act (NEPA) and related environmental review requirements that are necessary before project commitment. To foster sound Departmental planning decision making and public trust through effective process implementation, the NEPA objectives include: (a) ensuring the timely and adequate completion of NEPA reviews through technical assistance, independent review, and approval recommendation of major programmatic environmental impact statements (EISs), site-wide and other EISs, and related NEPA documents; (b) ensuring the consistency and quality of NEPA documents and increasing the efficiency of NEPA personnel by determining and responding to customer needs; (c) issuing guidance on selected technical and policy topics; (d) conducting workshops for Headquarters and field NEPA personnel; and (e) participating in NEPA process improvement teams and other initiatives that foster continuing improvement of the NEPA process. Another objective is to streamline the environmental review process by issuing revised regulations and DOE Orders to reduce costs and regulatory burdens so that the process works better, costs less, and is more useful to decision makers and the public.

Funding Schedule

Program Activity

	FY 1995	FY 1996	FY 1997	$ Change	% Change
NEPA	$3,500	$3,410	$3,500	$90	3%

Performance Summary

FY 1995 Accomplishments

- Awarded the prestigious Annual Federal Environmental Quality Award for excellence in implementing the NEPA compliance program by the Council on Environmental Quality and National Association of Environmental Professionals.

- Implemented process improvements to reduce the cost and time for DOE to comply with NEPA, improve decisions, and build public trust, as directed by the June 1994 Secretarial Policy Statement on NEPA.

- Developed a plan that will reduce the Department's NEPA compliance costs by more than $20 million over 5 years, in accordance with the Department's Strategic Alignment Implementation Plan.

- Issued guidance and conducted workshops to increase the Department's efficiency in preparing NEPA documents.

- Enhanced public participation opportunities by issuing an updated Directory of Potential Stakeholders, issuing guidance on Effective Public Participation under the NEPA, and creating a DOE NEPA Home Page on the INTERNET.

FY 1996 Accomplishments (to date and planned)

- Continue to implement a plan that will reduce NEPA compliance costs by more than $20 million over 5 years, in accordance with the Department's Strategic Alignment Implementation Plan, including Phase II of NEPA contract reform guidance.

- Continue and complete NEPA regulatory development process to reduce costs and regulatory burdens so that the NEPA process works better, costs less, and is more useful to decision makers and the public.

- Conduct workshops and issue guidance to increase the Department's efficiency in preparing NEPA documents (e.g., Volume 2 of the NEPA Compliance Guide, Environmental Justice in NEPA Documents, and Site-wide Environmental Impact Statements).

- Continue to enhance public participation opportunities.

- Provide technical assistance in the preparation of major programmatic environmental impact statements, site-wide and other environmental impact statements, and related documents.

FY 1997 Planned Accomplishments

- Continue to implement a plan that will reduce NEPA compliance costs by more than $20 million over 5 years, in accordance with the Department's Strategic Alignment Implementation Plan, including Phase II of NEPA contract reform guidance. ($0.25 million)
- Conduct workshops and issue guidance to increase the Department's efficiency in preparing NEPA documents. ($0.8 million)
- Continue to enhance public participation opportunities. ($0.1 million)
- Continue to provide technical assistance to ensure completion of major programmatic environmental impact statements and assist in preparing site-wide and other environmental impact statements and related documents. ($2.35 million)

Explanation of Funding Changes FY 1996 to FY 1997

- No significant changes.

774

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET
ENVIRONMENT, SAFETY AND HEALTH
EH NON-DEFENSE
RADIATION EFFECTS RESEARCH FOUNDATION

Program Performance Summary:

The Atomic Bomb Casualty Commission (ABCC) was established in 1946 to investigate the effects of radiation exposure in survivors of the atomic bombings of Hiroshima and Nagasaki. In April 1975, the Radiation Effects Research Foundation (RERF) was established as full successor to the ABCC. Annual funding for the operation of the RERF is provided equally by the Government of Japan through the Ministry of Health and Welfare and the U.S. Government through DOE.

Mission Supporting Goals and Objectives

The objective of the RERF is to conduct research and studies, for peaceful purposes, on the medical effects of radiation on man or diseases that may be affected by radiation, with a view to contributing to the maintenance of the health and welfare of atomic bomb survivors and to the enhancement of the health of all mankind. The EH prioritization criteria is to support ongoing studies of radiation-exposed populations in Japan. The efforts of the RERF research cuts across the Department's organizational entities.

The RERF research programs at the major laboratory in Hiroshima and Nagasaki consist of the following studies of fixed populations: the Life Span Study, the Adult Health Study, the Pathology Program, the Genetic Program (mortality study of survivors, cytogenetics study, biochemical genetics study, growth and development study), and a series of small substudies. The results of this research will be used to validate existing radiation protection standards or become the basis for changing those standards.

Funding Schedule

Program Activity

	FY 1995	FY 1996	FY 1997	$ Change	% Change
RERF	$18,000	$20,000	$15,000	$5,000	25%

Performance Summary

FY 1995 Accomplishments

- Published studies on Japanese atomic bomb survivors, which compare cancer incidence with cancer mortality.

FY 1996 Accomplishments (to date and planned)

- Continue RERF studies (e.g., Life Span Study, the Adult Health Study, the Pathology Program, the genetic Program) for atomic bomb survivors in Hiroshima and Nagasaki.

- A Blue Ribbon Panel, comprised of international scientists, met in FY 1996 to consider the quality, value, and direction of the scientific research conducted at the RERF. The Panel will make recommendations on future priorities for the research program.

FY 1997 Planned Accomplishments

- Continue United States participation in the bi-nationally funded research institution that studies the health effects of the survivors of the atomic bomb. ($15 million)

- Implement 25 percent cost saving measures identified in FY 1996.

Explanation of Funding Changes FY 1996 to FY 1997

- As directed by conference language, performing evaluation of program to identify cost saving measures.

Program Performance Summary:

Mission Supporting Goals and Objectives

Management and Administration provides for the centralized management and direction of the EH planning process, budgeting, financial control, procurement, information management, and technical training and professional development.

The environment, safety, and health planning process enhances the quality and cost-effectiveness of environment, safety, and health program performance of the line organizations. The Environment, Safety and Health Management Plan is the primary DOE-wide process that enables consistent identification of needed Departmental environment, safety, and health activities; risk-based priority setting; effective budget decision making and allocation of environment, safety, and health resources; and improved accountability for environment, safety, and health performance.

The goal of contract reform is to promote improved performance of operating organizations in managing significant environment, safety, and health risks in a cost-effective manner. The environment, safety, and health management planning process also assures that new contracts and renegotiated existing contracts implement environment, safety, and health portions of the Departmental Contract Reform Initiatives. Major program emphasis is focused on procurements and contractor selection processes; definition of environment, safety, and health incentives; and development of environment, safety, and health performance measures.

The Information Management program maximizes the sharing and efficient use of environment, safety, and health data and information. The program seeks to identify and facilitate access to data and information vital to the successful conduct of the programs and activities of EH by maintaining and integrating information systems to support the reporting, tracking, trending, analysis, and dissemination of environment, safety, and health information. The goal of this activity is to establish an integrated, information management program. Successful implementation of the information system will reduce information management redundancy, stream-line program operations, and reduce co· for stakeholders and the Department.

The Technical Training and Professional Development program assures that EH staff are properly trained to perform their duties related to environment, safety, and health matters in accordance with current DOE policy, procedures, and professional standards. This is accomplished through the development and maintenance of an environment, safety, and health training infrastructure; EH staff development programs in the areas of professional, technical, and information management proficiency; fellowships and grants to further industrial hygiene and health physics disciplines; specialized environment, safety, and health training as required for DOE and contractor employees; and development of safety and health technical qualification standards for DOE-wide use.

Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Management Planning	$3,000	$3,000	$3,000	$0	0
Contract Reform	2,000	2,000	2,000	0	0
Information Management	12,701	12,100	12,100	0	0
Technical Training & Professional Development	7,000	7,000	6,000	-1,000	-14%
Total Management & Admin.	$24,701	$24,100	$23,100	-1,000	-4%

778

Performance Summary

FY 1995 Accomplishments

- Achieved National Performance Review commitment to implement risk-based decision-making criteria into Departmental budgeting through the environment, safety, and health Management Planning Process.

- Achieved full participation of all Departmental sites in the environment, safety, and health Management Planning and Budget process.

- Developed new contract language (incorporated good environment, safety, and health business practices), which was included in four Requests for Proposal (RFP) for the management and operating contracts at DOE sites.

- Improved access to environment, safety, and health information through the EH Technical Information Services (TIS) Home Page (including access to DOE Lessons Learned Program data, Occupational Safety and Health Administration (OSHA) regulatory information, Voluntary Protection Program documentation; and radiation and hazardous waste information). TIS was recognized by the University of Michigan as an "Internet Jewel" for FY 1995.

- Facilitated Internet access to full text information (e.g., the Human Radiation Experimentation database, Operating Experience reports, Vulnerability studies, and the NEPA Home Page). The NEPA Home Page was recognized by the President's Council on Environmental Quality (CEQ) as a "model information source" and was used as the prototype for the Government-wide NEPA Internet page.

- Consolidated the environment, safety, and health Information Outreach program with publication of the ES&H Synergy newsletter, which consolidated six existing publications into one and expanded the DOE Safety Conference to encompass the full scope of environment, safety, and health activities.

- Developed and implemented an automated system for information management and tracking training activities (includes registration, course catalogs, Individual Development Plans, and personal Technical Qualifications documentation).

- Completed EH-related Technical Qualification Standards documents and initial development of training for EH staff and managers in the implementation of the Technical Qualifications program and developed an environment, safety, and health Training Implementation Plan.

- Support grants, fellowships, and training programs at colleges and universities to ensure the education and development of the future DOE EH workforce and provide specialized environment, safety, and health training in radiation protection and nuclear safety.

FY 1996 Accomplishments (to date and planned)

- Institutionalize and integrate environment, safety, and health risk-based planning and budgeting into overall line program risk-management activities.
- Utilizes a risk-based prioritization approach to review line program environment, safety, and health budgets and ensure that all risk-significant environment, safety, and health issues are adequately addressed in the Department's budget.
- Institutionalize environment, safety, and health contract language into DOE Acquisition Regulations (DEAR) clauses, ensure that the language is incorporated into the new contracts and RFPs issued during the year, and assist new contractors in appropriate implementation.
- Complete requirements analysis for providing DOE Headquarters, field offices, and management and operating contractors with integrated environment, safety, and health information systems and services.
- Enhance the Department's ability to provide quality environment, safety, and health information through an outreach program, which includes demonstrations of the EH Technical Information Service at conferences and meetings, feedback surveys, and full integration of all environment, safety, and health information on TIS.
- Enhance training of EH professional and technical personnel to increase their proficiency and develop and improve the skills mix of EH staff to more effectively implement the overall EH mission and programs.
- Support grants, fellowships, and training programs at colleges and universities to ensure the education and development of the future DOE EH workforce and provide specialized environment, safety, and health training in radiation protection and nuclear safety.
- Establish a postdoctoral research program in the radiation sciences designated to foster human health effects studies at a U.S. institution of higher learning.

780

FY 1997 Planned Accomplishments

- Help ensure accountability for environment, safety, and health performance by line managers, and work with the Chief Financial Officer to demonstrate success in accomplishing environment, safety, and health cost accounting for program activity execution at two pilot sites as a model for the entire Department. ($3.0 million)

- Continue to ensure new environment, safety, and health contract language is incorporated into the new contracts and RFPs issued during the year; ensure good environment, safety, and health performance measures; and assist new contractors in implementation of environment, safety, and health management processes (i.e., planning, budgeting, and program execution). ($2.0 million)

- Complete re-engineering/integration of Departmental environment, safety, and health occurrence, accident/incident analysis, and reporting systems, and empower users to perform site analyses, trending, reporting, and integrated information retrieval. ($6.0 million)

- Continue to manage environment, safety, and health information systems to provide communications and processing capabilities that allow DOE staff to effectively communicate and access information. ($6.1 million)

- Continue to develop training capabilities that improve the technical competency and skills mix of EH staff to more effectively implement the overall EH mission and programs. ($0.4 million)

- Support grants, fellowships, and training programs at colleges and universities to ensure the education and development of the future DOE EH workforce ($3.4 million) and specialized environment, safety, and health training for DOE workforce. ($2.2 million)

Explanation of Funding Changes FY 1996 to FY 1997

- Continued reduction of support service contractors. ($-1.0 million)

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ENERGY SUPPLY, RESEARCH AND DEVELOPMENT
(Tabular dollars in thousands)
ENVIRONMENT, SAFETY AND HEALTH
PROGRAM DIRECTION, EH NON-DEFENSE

PROGRAM PERFORMANCE SUMMARY:

Mission Supporting Goals and Objectives

Program Direction provides overall direction and administration support for the EH programs to ensure that all operations are conducted in the most efficient manner consistent with environment, safety, and health activities. Program Direction provides funds for all personnel-related expenses, capital equipment, and contracted services of Headquarters. The Departmental Working Capital Fund, established to fund business-type activities traditionally financed in the Departmental Administration account, is funded from this decision unit. The **goal** of Program Direction is to provide resources and skills in a way that provides DOE's line management programs with the tools it needs to protect workers, the public, and the environment at DOE sites.

Budget Structure Changes

The Department's Working Capital Fund, established to fund business-type activities, is transferred from the Departmental Administration account to the Department's program office.

Working Capital Fund supports the following: rent and utilities, printing, copying, postage, supplies, telephones, computers, Defense Contract Audit Agency audits, contract close out, workmans compensation, and Senior Executive Service bonuses.

782

Funding Schedule

Headquarters	FY 1995	FY 1996[4]	FY 1997	$ Change	% Change

Capital Equipment	$1,037	$ 0	$ 0	$ 0	$ 0
Program Direction Total	$45,113	$39,315	$39,046	$-269	1%
FTEs	347	316	316	0	0
Average FTE[5]	127	124	124	0	0

FY 1995 Measurable Performance Activities

- Developed technical qualifications program.
- Reduced utilization of contractors.
- Supported effort for Human Radiation Experiments activities.

[4] Reflects Program Direction of the Energy Supply, Research and Development portion of Environment, Safety and Health.

[5] Capital Equipment is not incorporated in the weighted FTE average.

FY 1996 Measurable Performance Activities

- Reduction and streamlining of contractor utilization.
- Implement technical qualifications program.
- The field, contractors, and outside organizations increasing adopt EH standards, environment, safety, and health performance trends improve; e.g., decreased lost work days due to occupational illness or injury, decreased number of personnel contaminations with radionuclides, and a decreasing trend in the number of serious accidents where policy is a root cause of the problem.

FY 1997 Planned Accomplishments

- Continued reduction and streamlining of contractor utilization.
- Continue technical qualifications program.
- Support the protection of worker health and safety.

Explanation of Average FTE Cost

- The average FTE cost includes salaries, benefits, travel, support, and working capital fund. The reduction from FY 1995 to FY 1997 reflects a streamlining of contractor support. The working capital fund for EH reflects all 422 FTEs. The average weighted FTE across EH is $118,000.

Explanation of Funding Changes

- Continued reduction and streamlining of contractor utilization and Federal travel.

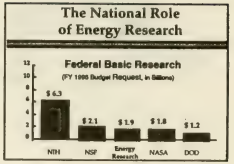
Mission



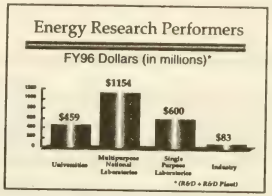
The Office of Energy Research (ER) invests in basic research to enable the Department to meet its science and technology intensive missions. Our programs produce scientific and technical knowledge needed to create new and improved energy technologies, to maintain U.S. scientific leadership in understanding energy and matter, and to provide facilities for research in the physical and life sciences needed by U.S. researchers for forefront research. Our research extends to an unusually broad spectrum of scientific disciplines, including materials sciences, chemical sciences, engineering sciences, geosciences, energy biosciences, computational and applied mathematical sciences, high energy and nuclear physics, fusion science, biological and biomedical sciences, and environmental research. Over the past year under the Strategic Facilities Initiative started in FY 1996, ER has increased access to its basic research facilities to scientists in these fields.

ER's activities comprise over 95 percent of the science and technology business line of the DOE Strategic Plan, *Fueling a Competitive Economy*. ER programs support several thousand individual projects and hundreds of laboratories, universities, and other research facilities throughout the United States. Through direct support and access to our user facilities, ER enables multidisciplinary research on important national problems and individual investigations by scientists and engineers in many disciplines.

Basic research supported by ER is increasingly important to America. As reported by the Wall Street Journal, "Some of the biggest U.S. Corporations have cut back sharply on research into 'basic science'--the exploration of how nature works at a fundamental level--to pursue short-term goals and to commercialize products more quickly." As 16 chairpersons and CEO's of major U.S. corporations wrote to the Congress, "History has shown that it is federally sponsored research that provides the truly patient capital needed to carry out basic research and create an environment for inspired risk-taking that is essential to technological discovery. "

ER supports the Federal Government's third largest basic research program. Only the National Institutes of Health and National Science

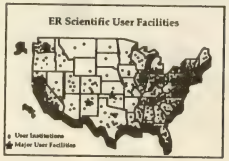
Foundation programs are larger. Over 18,000 scientists and engineers from almost 600 universities, companies and government laboratories performed research at ER's laboratories and many special user facilities in 1995. These facilities include large and expensive x-ray and gamma-ray "light" sources, research reactors, and high energy and nuclear physics particle accelerators located in 11 states. Our research at universities helps educate and nurture the next generation of scientists and engineers. More important, these young people bring the creative enthusiasm of youth to tackle national problems.



Over the past 50 years, DOE has established an extensive national laboratory and university network of expertise in science and engineering. This network has supported the research of over 67 Nobel Prize winners. Today, ER multidisciplinary research at these facilities produces knowledge, instruments, techniques, and materials that others can use for additional research or for technology development. ER's Human Genome Program, for example, originated from concerns about the genetic effects of energy-related nuclear radiation and chemical byproducts. Today, its discoveries enable medical researchers to develop new biotechnology for diagnosing and treating diseases such as cancer.

Consistent with the Department's Strategic Plan, ER has identified five goals. Our five broad goals point us in the right direction. They sustain our longstanding traditions of emphasizing scientific excellence and working in partnership with other organizations dedicated to advancing energy and supporting science. Reaching them will help provide America with the range of energy and policy options it needs for future prosperity. The goals are:

- Enable the United States to maintain a position of world leadership in science, mathematics, and engineering needed to enhance energy productivity and ensure reliable energy services while preserving human and environmental health and safety.
- Obtain major new insights into the nature of energy and matter to better understand our natural world.
- Build and operate the best and most advanced scientific research facilities and infrastructure to advance the frontiers of science.
- Ensure that ER's programs are of high quality, highly productive, and that they are widely known, valued, and trusted.
- Ensure that ER programs protect our workers, the public and the environment during the support of and conduct of research.



Strategy

ER's budget request of $2,548.6 million for FY 1997 is shown in Table 1 by major ER program and appropriation. ER is seeking $653.7 million for its Basic Energy Sciences program, $379.1 million for its Biological and Environmental Research program, $679.1 million for its High Energy Physics program, $318.4 million for the Nuclear Physics program, $255.6 million for the Fusion Energy Sciences program, and $158.1 million for Computational and Technology Research. The request also includes $19.1 million for the University and Science Education program, $28.9 million for the Multiprogram Energy Laboratories Facility support program, $11.6 million for General Science Program Direction, $42.2 million for ER Energy Supply Program Direction, and $2.0 million for Energy Research Analysis.

Energy Research Goals

- World leadership in energy science
- New insights into the nature of energy and matter
- The best research infrastructure for energy science and basic research
- High quality, highly productive, widely known, valued, and trusted research programs
- Protection of our workers, the public and the environment during the support of and conduct of research

ER's FY 1997 request includes a balanced set of investments that uphold the Office's leadership in fundamental research, scientific facilities, and building the nation's scientific and technical strength. To leverage these investments with limited resources, we are working with university, industrial, and national laboratory research partners to multiply the effectiveness of our activities.

Strategies to support our goals reaffirm our traditional reliance on merit review with peer evaluation of investigator-initiated proposals as we seek new directions for our research programs. These programs will help expand the Nation's human and intellectual resources to ensure that America's capabilities for scientific and technological innovation are constantly replenished. The strategies are:

- *Support science with a purpose.* To warrant Office of Energy Research support, a research project must be mission-relevant. That is, it must advance knowledge in key fields and disciplines, further pursuit of departmental missions, or enable timely response to national goals. Our programs also cover fields not covered by traditional disciplines that offer challenges for new knowledge and opportunities for fulfilling departmental missions and national goals.

- *Provide large scale facilities.* ER supports large and complex research facilities to meet the Nations science and technology goals. Specifically, we focus on facilities that are too expensive for a single institution or group of institutions to build. We make the facilities available for the best research proposed by university, industrial, and government scientists as decided by peer review. Our strategy includes streamlined management of these facilities and investments in technology development. Timely repair and maintenance of their general purpose infrastructure advances the capabilities and reduces the costs of facilities.

- *Coordinate research on complex national problems important to DOE missions.* ER programs coordinate and fund multidisciplinary research at universities and the National Laboratories on complex national problems requiring a long investment horizon to find satisfactory solutions. The problems are found in areas such as fusion energy sciences, global climate change, and advanced and environmentally conscious manufacturing. Additional areas include advanced materials and processing, medical applications of advanced imaging techniques, high performance computing and communications, and mapping and sequencing the human genome. The National Laboratories, with their multidisciplinary teams, are special resources for coordinating and performing this research.

Energy Research Achievements

- Nobel Prize
  - 1994 Physics
  - 1995 Physics and Chemistry
- Top Quark Production at Fermilab
- World Record in Tokamak Fusion Test Reactor
- First Beam in Advanced Photon Source
- Human Genome Program - 1996 Completed Maps of Two Human Chromosomes

- *Assure excellence in research.* We emphasize initiation of proposals by investigators and select the best using peer review. Our various standing advisory committees help us use the Nation's science and technology communities to identify the most important research to support and the best way to do it. Our program managers measure research quality within technical areas or disciplines with scheduled periodic evaluations, including assessment by panels of technical experts. For excellence in the future, we reach out to improve the quality of and access to science, mathematics, and engineering education to replenish America's storehouse of scientific talent.

- *Continuously improve the quality of our administrative processes.* We increase our effectiveness and productivity by improving program management practices and by using performance based contracts with our laboratories. Our operating policies emphasize the central role of the grantees and contractors in achieving environmental, safety, and health excellence through continuing self assessments and corrective action systems. Quality improvement includes leveraging resources through domestic and international partnerships. ER's programs seek out America's excellent scientists, employees, and contractors from all of its people.

- *Tell better the role and benefits of ER.* We are reaching out more than ever through presentations, newsletters, and the Internet to inform the public about the exciting results of ER research. An information infrastructure under development will ease communications, research collaborations, and remote access to shared resources and facilities.

The Office's basic research portfolio has brought great success in advancing science, the Department's missions and the welfare of the Nation. In 1995, research supported by the Office of Energy Research was cited in Nobel Prize awards in physics and chemistry. The award winning physicists discovered the neutrino and the tau lepton, key steps in identifying the fundamental particles in nature. Our chemistry award winners found the effect of freons on the ozone layer in the Earth's atmosphere and, thus, the effect of humankind on the environment.

792

Our physics researchers discovered the Top Quark--the last undiscovered quark of the six predicted by the Standard Model of physics--a long awaited scientific achievement. ER research advanced our understanding of such important phenomena as Global Climate Change. It explored new areas of science such as the Human Genome that will have extensive effects on human health and the environment. In the human health area, our human genome research program published detailed maps of two human chromosomes.

ER basic research enabled industrially promising innovations such as a technique to rapidly screen new compounds and materials to identify their properties. Other ER research created flexible superconducting tapes carrying electrical currents 100 times greater than previously possible which may lead to more efficient electrical storage and transmission devices. ER research on high speed computing and communication pointed the way to technology that can accelerate growth of the information highway by doubling data transmission rates over telephone lines.

In 1995, *R&D Magazine* recognized inventions engendered by ER-supported basic research with 7 R&D-100 Awards. Each year, *R&D Magazine* presents these awards to inventions with exceptional industrial promise. The 1995 award-winning technologies, for example, will aid in soil cleaning, ultrasonic imaging, and emissions monitoring.

On the facilities front, our researchers in Virginia in 1995 started the first experiments at the Continuous Electron Beam Accelerator Facility. The Advanced Photon Source at the Argonne National Laboratory, the B-Factory at the Stanford Linear Accelerator Center, the Environmental Molecular Science Laboratory at the Pacific Northwest Laboratory, and the Combustion Research Facility at the Sandia National Laboratories are on schedule. The Tevatron accelerator at Fermilab set a world record for particle beam luminosity. We completed the Radioactive Ion Beam Facility at Oak Ridge National Laboratory that allows scientists to learn the properties of unstable nuclei encountered in astrophysics.

Energy Research Strategies

- Support science with a purpose
- Coordinate multidisciplinary research on complex national problems important to the DOE missions
- Provide large scale facilities and technology for doing science
- Assure excellence in research
- Continuously improve the quality of our administrative processes
- Tell better the role and relevance of Energy Research

Major Changes

In formulating the program this year we have as our highest priorities: sustain progress in high energy physics and nuclear physics, transition to a fusion energy sciences program, optimize use of ER's scientific and computational facilities, selective expansion of programs, and leverage basic research through partnerships with DOE technology R&D programs

For FY 1997, the Biological and Environmental Research Program will give more emphasis to biotechnology research. Drawing on core competencies developed in ER's human genome and environmental research programs, we will speed development of new bioremediation technology for

use at DOE facilities. ER's research aimed at completing mapping and sequencing of the human genome is on target for completion in the year 2005. In FY 1997, more emphasis will be devoted to high throughput genome sequencing. We continue research into new ways to image the effects of carcinogens. In FY 1997, ER will expand its exploration of the world of microbial diversity, mapping and sequencing the genomes of microorganisms for possible use in bioremediation.

Consistent with its reduced budgets, the fusion program is being redirected toward smaller-scale, long-term fundamental research at universities and our laboratories as recommended by the Fusion Energy Advisory Committee. In addition, the program will preserve our capabilities to contribute to international efforts to develop fusion as an energy technology. It will do this by advancing plasma science; by developing fusion science, technology, and plasma containment innovation in the domestic program; and by remaining a partner in the international effort.

Energy Research
FY 1997 Priorities

- Sustain High Energy and Nuclear Physics
- Transition To A Fusion Energy Sciences Program
- Maintain Science Facilities Utilization
- Selective Expansion of Programs
- Integrate Basic Research and Applied Programs

As recommended by the Yergin Panel, we are strengthening collaborations with the Office of Environmental Management and the Office of Energy Efficiency and Renewable Energy. In partnership with the Office of Environmental Management, for example, we perform fundamental research that addresses problems in environmental management, remediation, and restoration that are intractable without new, fundamental scientific information and technologies. In partnership with the Office of Energy Efficiency, for example, we perform basic research in support of the Partnership for a New Generation of Vehicles. This research helps to bridge a gap between the Department's fundamental research and its other programs.

The ER high energy physics program continues to explore participation in the Large Hadron Collider project at CERN. This activity will enable the U.S. to participate in new discoveries at the highest energy frontier. We plan to complete the B-factory project at the Stanford Linear Accelerator Center in FY 1998 and the Main Injector project at Fermilab in FY 1999. Both projects are on schedule and within estimated costs. The Main Injector will provide a doubling of intensity for the fixed target program and a fivefold increase in luminosity for collider experiments. This will, among other things, let us take a closer look at the nature of the top quark. The B-factory will enable scientists to study charge-parity violation, a process that explains the complete dominance of matter over antimatter in our universe and, therefore, our very existence. In nuclear physics, construction of the Relativistic Heavy Ion Collider (RHIC) continues. Total project cost, however, has increased because of rebaselining necessitated by a FY 1996 congressional funding reduction to the project.

We are extending the availability and utility of our laboratories and user facilities through high performance computing and communications. Advances from our research are part of the joint Energy Research and Defense Programs DOE 2000 Initiative. The new capabilities will enable scientists nationwide to work together on problems as easily as if they were at the same National Laboratory or

facility. We denote this as transforming our research infrastructure from distinct laboratories into "collaboratories."

To help strengthen America's technical work force and support DOE's missions, ER will continue its leadership in the national effort to improve math, science, and engineering education. In FY 1996, over 10,000 undergraduate, graduate, and postdoctoral students and faculty will participate in DOE science education programs at our national laboratories.

In its action on the FY 1996 budget, the Congress directed that all Federal staff be budgeted in single Program Direction decision units for each appropriation. Energy Research's General Sciences and Research staffing has always been budgeted at the appropriation level and the congressional direction has not had any impact on that account. Energy Research's Energy Supply Research and Development staffing, however, has previously been included in the individual program accounts in the Energy Supply Research and Development appropriation, namely Basic Energy Sciences, Biological and Environmental Research, Fusion, etc. In compliance with the referenced congressional direction, those various accounts have been merged into a single Energy Research-Energy Supply Program Direction account for the first time in FY 1997.

Investing In The Future

"Investment in R&D--public and private--is America's investment in its future. It is a major driver of economic growth and job creation, and one of the most important foundations for America's future economic competitiveness and international leadership."

Secretary of Energy Advisory Board
Task Force on Strategic Energy Research and Development
Daniel Yergin, Chairman

Details supporting the budget request for the two Program Direction accounts are included in the narrative budget justification for each. The combined request for FY 1997 for the two accounts is $53.7 million. The attached chart illustrates the distribution of the FY 1997 request among six major categories.

Using any reasonable criteria, Energy Research is among the most efficiently managed research organizations in the Federal Government. The Energy Research program is one of the largest and most complex Federal basic science programs. Energy Research's staffing levels, however, are small compared with those of other Federal research organizations and other Department of Energy program offices. Furthermore, Energy Research has been a very conservative user of support services contracts. Planned FY 1997 support services funding represents a mere four tenths of a percent of the total Energy Research budget request. The FY 1997 budget requested for Program Direction is essential for Energy Research to sustain technical excellence in its programs and to meet its program and advisory missions.

Closing

Through multidisciplinary research, our programs advance fundamental understanding of matter and enable energy and complex ←

leading to efficient, diverse and reliable energy sources. The knowledge gained leads to improved health and environmental quality and to a more productive and competitive economy. Energy Research provides the United States with the finest and most advanced scientific research facilities and infrastructure. To get the most research out of every dollar appropriated, we work to ensure our programs are the highest quality and productive. It is in the interest of the Nation that these programs are sustained for the benefit of future generations.

BIOLOGICAL AND ENVIRONMENTAL RESEARCH PROGRAM

PROGRAM MISSION

The Biological and Environmental Research Program (BER) provides fundamental science to underpin the five business thrusts of the Department's strategic plan. Through its support of peer-reviewed research at national laboratories, universities, and private institutions, the program develops the knowledge needed to identify, understand, and anticipate the long-term health and environmental consequences of energy production, development, and use. The research is also designed to provide science in support of the Energy Policy Act of 1992.

The GOAL of the BER program is:

To develop the information, scientific "know-how," and technology for identification, characterization, and mitigation of adverse health and environmental consequences of energy production, development, and use.

The OBJECTIVES related to these goals are:

1. To CONTRIBUTE TO A HEALTHY CITIZENRY - Map the fine structure of the human genome by the year 2005; conduct fundamental research necessary for the development of advanced medical technologies and radiopharmaceuticals; and use the unique National Laboratory facilities to determine biological structure and function at the molecular and cellular level.

2. To CONTRIBUTE TO CLEAN UP OF THE ENVIRONMENT - Conduct fundamental research necessary for the development of advanced remediation tools and risk assessment methodologies for containing wastes and cleaning up DOE's contaminated sites, particularly in support of the mission of DOE's Environmental Management (EM) office.

3. To UNDERSTAND GLOBAL ENVIRONMENTAL CHANGE - Acquire the data and develop the understanding necessary to pre- and how energy production and use can affect the global and regional environment.

807

PROGRAM MISSION - BIOLOGICAL AND ENVIRONMENTAL RESEARCH - (Cont'd)

SCIENTIFIC FACILITIES UTILIZATION:

The Biological and Environmental Research request includes $14,400,000 to maintain support of the Department's scientific user facilities. Facilities used for structural biology research, such as beam lines at the synchrotron light sources and research reactors, are included in the initiative for the first time in FY 1997. This funding will significantly provide research time for scientists in universities, federal agencies, and U.S. companies. It will also leverage both Federally and privately sponsored research consistent with the Administration's strategy for enhancing the U.S. National science investment.

PERFORMANCE MEASURES

Many performance measures related to basic science activities are qualitative rather than quantitative. The quality of the BER program is continuously evaluated through the peer-review process which includes: review panels comprised of outside experts, advisory committees, site visits, and reviews conducted by the Office of Energy Research. Examples of measures are:

1. New scientific discoveries and technological innovations that accelerate the sequencing and mapping of the human genome.

2. The development of advanced medical technologies and radiopharmaceuticals from fundamental research in molecular, structural, and cellular biology.

3. The development of advanced remediation tools (e.g., bioremediation) and risk assessment methodologies to contain hazardous waste and clean up DOE contaminated sites from fundamental research in environmental sciences, biology, molecular sciences, and mathematical modeling.

4. The development of advanced predictive models of the effects of energy use on the global environment from basic research in environmental sciences.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- A new structure has been developed for the Biological and Environmental Research program. The existing structure was a product of the long, productive history of the program. However, it no longer reflected the program priorities or the on-going integration across scientific disciplines. The new structure contains the following subprograms: Life Sciences; Environmental Processes; Environmental Remediation; and Medical Applications and Measurement Sciences.

PROGRAM MISSION - BIOLOGICAL AND ENVIRONMENTAL RESEARCH - (Cont'd)

- Critical information has been acquired regarding the molecular nature of the human genome and genomes of other organisms, and explorations are continuing on the basic chemical structures of important biological molecules as they relate to the functions of living cells. These continued advances are central to understanding health effects and human disease-susceptibility and for applications of biotechnology to the Department's missions. Increased emphasis will be placed on large-scale sequencing of select chromosomes.

- New strategies for cleanup, e.g., use of biotechnology (e.g., microbes that break down contaminants) will be developed for stubborn remediation problems.

- Advanced technologies have been developed to determine and mitigate the potential health effects from energy activities and cleanup operations. Emphasis is placed on the risks to human health from exposures to low levels of radiation and chemicals both at home (e.g., radon) and at the DOE workplace (e.g., waste site cleanup).

- Significant improvements are being made in the predictive tools needed to quantify human-induced and natural global environmental changes, including those from energy production and use. Emphasis remains on the role of clouds in climate and on developing improved climate models using the Nation's most advanced computers.

- New nuclear medicine technologies and radiopharmaceuticals for improved medical diagnosis and therapy are being developed, contributing to improved health care delivery while reducing costs by achieving early diagnosis and treatment. Increased emphasis will be placed on improved imaging methodologies.

- Research in the area of indoor air quality related to radon exposure has been completed and transfer of the methodologies to key stakeholders is underway (e.g., the Environmental Protection Agency and state and local authorities).

- The program has developed new measurement technologies (e.g., chemical and biological sensors) in the Medical Applications and Measurement Science subprogram to enhance research carried out in BER activities. Examples include resonance ionization spectroscopy for environmental dating and flow cytometry for chromosome and cell separations.

LIFE SCIENCES

(Tabular dollars in thousands. Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

Develops fundamental biological information and advanced technologies for understanding and mitigating the potential health effects of energy development, energy use, and waste cleanup; and develops and utilizes unique DOE resources and facilities to develop new biotechnology tools to address Departmental and national goals. Research is conducted in five areas: cellular biology, molecular biology, structural biology, the human genome, and health effects.

- Basic molecular and cellular biology research identifies and characterizes genes that repair damaged DNA and control cell proliferation to determine individual responsiveness to energy-related materials and susceptibility to adverse health effects, including cancer.

- Structural biology research is conducted at DOE national user facilities to determine the molecular structure of important biological molecules, such as enzymes, antibodies, or other proteins. Computational biology research combines computer science, structural biology, and genome research to predict the three dimensional structure of proteins from the DNA sequence of the corresponding gene. Knowledge of the structure and function of biological molecules will assist the application of biotechnology to diverse areas of national needs, e.g., rational drug design and environmental cleanup.

- Genome research develops and applies new technologies and resources to map and determine the sequence of 3 billion bases that make up the DNA found in a typical human cell and supports related studies in ethical, legal, and social implications (ELSI), especially issues of privacy, commercialization, and education. Microbial genome research characterizes the DNA and proteins in microbes with biotechnology applications in energy production, environmental bioremediation, and industry.

- The information and technologies developed in this research advance the biotechnology missions of the Department including: improved industrial processes, increased agricultural yields, energy production from biomass, environmental remediation, and improved molecular-based tools for health surveillance, biological dosimetry, and individual susceptibility determination.

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Structural Biology	18,554	$ 22,568	$ 21,930	$- 638	- 2.8%
Molecular and Cellular Biology	19,796	20,852	20,755	- 97	- 0.5%
Human Genome	65,752	67,792	75,730	+ 7 ,938	+ 11.7%
Health Effects	34,736	22,424	20,550	- 1,874	- 8.4%
Total, Life Sciences	$ 138,838	$ 133,636	$ 138,965	$+ 5,329	+ 4.0%

III. Performance Summary:

FY 1995 Accomplishments (to date and planned):

- o Cloned two genes involved in the regulation of cell growth; the genes are important for understanding the development and treatment of cancer.
- o Isolated genes responsible for two DNA repair enzymes that are associated with diseases that increase radiation sensitivity and susceptibility to cancer.
- o Developed strains of mice that are missing DNA repair genes, as models for humans with defects in these genes, to study the function and regulation of these genes.
- o Began three new projects aimed at sequencing the DNA of industrially important microbes and completed sequencing the DNA of Mycoplasma genitalium, the smallest free-living organism.
- o Completed the sequence of the first one million out of a total of three billion bases of human DNA.
- o Published high resolution physical maps of human chromosomes 16 and 19 that are useful to scientists interested in isolating disease genes on these chromosomes and that serve as templates for high-throughput DNA sequencing.
- o Transferred advanced DNA sequencing technologies from National Laboratories to several academic and private sector laboratories, improving the efficiency and cost-effectiveness of DNA sequencing. Made new resources of cloned DNA for mapping and sequer human DNA commercially available.

III. Performance Summary: LIFE SCIENCES (Cont'd)

- o Produced draft genetic privacy legislation now under consideration in many state legislatures; produced a reference "deskbook" for judges on the use of genetic evidence in court cases.
- o Completed a high school biology curriculum on the management of computerized genetic information.
- o Initiated projects to examine the role of individual susceptibility in cancer risk including genetic factors associated with lung cancer and differences in maternal/fetal susceptibility to environmental pollutants.
- o Research to examine the biological role of tissue's extracellular matrix demonstrated its importance in regulating the function of genes that determine normal tissue function; this is important in understanding the development of many diseases, including cancer.
- o Initiated studies to reevaluate radon doses in uranium miners to improve estimates of cancer risk; built a detector for noninvasively measuring radon decay products deposited in bones of miners.
- o Funding in the amount of $2,889,000 and $144,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments

- o Commission new synchrotron beamlines for protein cryotallography at SSRL, ANL, and LBNL.
- o Initiate development of next generation of detectors for structural biology studies at synchrotron.
- o Expand the computational structural biology program to provide the basic computing tools and infrastructure to understand the relationship between the form and the function of biological molecules.
- o Characterize the function of two genes involved in regulating changes in cell growth following the exposure of cells or tissues to low levels of energy-related materials. Characterize defects in a DNA repair gene associated with a human disease.
- o Determine the response of two DNA repair genes to energy-related radiation and chemicals.
- o Characterize mice that are missing DNA repair genes for adverse health impacts.

III. Performance Summary: LIFE SCIENCES (Cont'd)

- o Determine the DNA sequence of two industrially important microbes.
- o Complete the sequence of two million bases out of a total of three billion of human DNA sequence.
- o Characterize clones of human DNA, used as resources for DNA mapping and sequencing, that represent one-third of all DNA in a typical human cell.
- o Highly acclaimed high school genetics curriculum to be translated into Spanish and used in the Los Angeles school system.
- o Publish overview of large animal life-span carcinogenesis studies, multi-study analysis of inhaled plutonium-238 oxide carcinogenesis in experimental animals, and multi-laboratory control data base for beagle dogs. These studies provide an important data base to help assess risk to clean-up workers who may be exposed to radionuclides with little or no human epidemiological data.
- o Develop a computer model that helps states, counties and municipalities locate the homes with a high indoor radon potential.
- o Identify two candidate genes involved in cell aging (senescence) that represent important target genes for controlling cell growth and, as a result, the development of cancer.
- o Increase the sensitivity of a technique (comparative genomic hybridization) for detecting small increases and decreases in the number of copies of individual chromosomes to identify or characterize abnormal cells in tissues or tumors.
- o Funding in the amount of $2,649,000 and $184,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- o Commission synchrotron beamline for biological x-ray spectroscopy at LBNL (ALS).
- o Initiate station for structural biology studies at the LANSCE facility at LANL.
- o Make preliminary prediction of a protein's three dimensional structure from the DNA sequence of the gene coding for the protein using new computational tools for applications such as rational drug design and environmental cleanup.

III. Performance Summary: LIFE SCIENCES (Cont'd)

- o Determine biological function of a DNA repair gene associated with a human disease.
- o Determine the function of two newly identified human genes using animal models in which cloned genes can be inserted and expressed.
- o Determine complete DNA sequence of four industrially important microbes. Characterize the evolutionary relationship between previously uncharacterized microbes of potential industrial importance.
- o Complete physical map of human genome by identifying unique DNA marker sequences for majority of human genes and placing information in public databases.
- o Complete the sequence of eight million out of a total of three billion bases of human DNA sequence.
- o Complete production and broadcast of radio series on genome research and television documentary on ELSI, "Genetics and Society."
- o Develop an animal carcinogenesis data base that will provide better estimates of risk for clean-up workers exposed to radionuclides with little or no human epidemiological data.
- o Make publicly available a computer model for finding homes with high levels of radon.
- o Test genes that may be responsible for the aging of cells by determining their ability to reverse the cell-aging process.
- o Reduce the size of the molecular probes needed for comparative genomic hybridization tests from whole chromosomes to defined DNA sequences to improve the resolution necessary to identify genes associated with cancer and genetic diseases.
- o Funding in the amount of $3,446,000 has been budgeted for the SBIR program.

817

III. Performance Summary: LIFE SCIENCES (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997:

The increase ($+7,938,000) for genome research will be devoted to high-throughput sequencing of human DNA. These additional funds will support an increased output of finished DNA sequence from 2 million bases in FY 1996 to 8 million in FY 1997.

The decrease ($-1,874,000) in Health Effects is due to the phasing out of most traditional, long-term research in radiation biology in FY 1996, including programs at the University of California at San Francisco and Pacific Northwest National Laboratory and a partial phase out at the Inhalation Toxicology Research Institute in FY 1997. Priorities will be shifted to research that addresses the traditional issues of health risks of exposure to low levels of energy-related materials using the unique, new resources and tools developed in the Department's human genome, structural biology, and cellular and molecular biology programs.

The decreases in Structural Biology ($-638,000) and Molecular and Cellular Biology ($-97,000) are necessary to maintain overall program balance and direction.

ENVIRONMENTAL PROCESSES

(Tabular dollars in thousands. Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

Research is focused on understanding the basic chemical, physical, and biological processes of the Earth's atmosphere, land, and oceans and how these processes may be affected by energy production and use, primarily the emission of carbon dioxide from fossil fuel combustion. A major part of the research is designed to provide the data that will enable an objective assessment of the potential for, and consequences of, global warming. The program is comprehensive with an emphasis on the radiation balance from the surface of the Earth to the top of the atmosphere including the role of clouds and on enhancing the quantitative models necessary to predict possible climate change at the global and regional levels. There are four contributing areas to this research program: Climate and Hydrology, Atmospheric Chemistry and Carbon Cycle, Ecological Processes, and Human Interactions. The National Institute for Global and Environmental Change (NIGEC) is included within these four areas. The Environmental Processes subprogram is DOE's contribution to the U.S. Global Change Research Program that was codified by Congress in the Global Change Research Act of 1990.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Climate and Hydrology	$ 53,515	$ 51,804	$ 54,267	$+ 2,463	+ 4.8%
Atmospheric Chemistry and Carbon Cycle	27,317	29,032	27,164	- 1,868	- 6.4%
Ecological Processes	12,287	11,797	11,448	- 349	- 3.0%
Human Interactions	9,733	8,981	9,458	+ 477	+ 5.3%
Total, Environmental Processes	$ 102,852	$ 101,614	$ 102,337	$+ 723	+ 0.7%

III. Performance Summary:

FY 1995 Accomplishments:

o Second ARM Site established in Tropical Western Pacific. Started key measurements to determine how tropical clouds are mathematically represented in General Circulation Models (GCMs).

III. Performance Summary: ENVIRONMENTAL PROCESSES (Cont'd)

- o Parallel Ocean Program model delivered by CHAMMP to climate modeling community for coupling with atmospheric models. Continued ocean process modeling efforts to improve understanding of exchange of heat and carbon dioxide between the ocean and atmosphere.

- o Terrestrial Carbon Processes Research Program initiated to quantify fraction of fossil carbon dioxide taken up by terrestrial vegetation and to predict future uptake.

- o Initiated major field program at Cape Hatteras, NC, to probe changes in biological and geological properties at the ocean-land interface from increasing concentrations of atmospheric carbon dioxide.

- o Provided regional estimates of sensitivity of ecological systems to climatic and atmospheric changes as a foundation for science-based assessments of the consequences of global change.

- o Continued development of integrated assessment models and other means for assessing the potential environmental and economic consequences of natural and human-induced climatic and atmospheric changes.

- o Supported new graduate and post-doctoral fellowships to provide for the next generation of multidisciplinary research scientists.

- o Acquired and analyzed data to determine the possible impact of energy emissions on tropospheric and stratospheric ozone.

- o Radon program completed, and results synthesized to develop protocols for identifying areas with high risk potential for elevated indoor radon.

- o The Quantitative Links program was completed, delivering information for the ARM and other programs.

- o Funding in the amount of $2,183,000 and $110,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- o Complete the experiments at the Oklahoma ARM site that will solve the puzzle of anamalous short wave absorption by clouds.

- o Begin periodic Intensive Observational Periods (IOPs) at the ARM site in the Tropical Western Pacific to improve parameterization of clouds in climate models. Continue collaborations with Australia, Papua New Guinea, and Japan. Initiate preparations for third ARM site on the North Slope of Alaska.

III. Performance Summary: ENVIRONMENTAL PROCESSES (Cont'd)

- o Implement initial experiments with coupled climate system models on massively-parallel super-computers to capitalize on computational improvements. Execute multi-decade simulations of climate change to address century-scale climate prediction and evaluate estimates of model uncertainties to changes in atmospheric concentrations of greenhouse gases.

- o Continue experiments to quantify forest ecosystem responses to elevated carbon dioxide and climate variation.

- o Complete measurements of ocean carbon in the Indian Ocean as part of the global survey of inorganic carbon in the ocean to understand role of ocean in the uptake of atmospheric carbon dioxide.

- o Develop improved process models and methods for assessing regional consequences of atmospheric and climatic changes on ecological systems and human resources.

- o Evaluate success of global change fellowship program with respect to training of new scientists and the development of cross-disciplinary skills of the graduate- and postdoctoral fellows.

- o Participate in the North American Research Strategy for Tropospheric Ozone (NARSTO) Program, designed to quantify and characterize the scientific uncertainties of urban and rural smog and provide data for science-based air quality management decisions by Federal, state, and local authorities.

- o Field experiment of land-ocean research becomes fully operational and its completion results in determining if the coastal oceans are a source or sink for atmospheric carbon dioxide.

- o Initiate field experiments to determine the coupled effects of elevated carbon dioxide and ozone on growth and productivity of forests.

- o Funding in the amount of $1,526,000 and $123,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- o Establish third ARM Site on North Slope of Alaska and begin arctic data collection to support improvements in treatment of clouds and radiation in GCMs. Maintain full operation at the ARM sites in Oklahoma and the Tropical Western Pacific.

- o Include advanced understanding of how clouds affect atmospheric heating and cooling in the GCMs based on ARM data. Initiate the next step in the comparison of models by coupling with ocean models to enable the long-term climate predictions necessary for understanding global climate change.

III. Performance Summary: ENVIRONMENTAL PROCESSES (Cont'd)

- o Provide improved estimates of atmospheric carbon dioxide changes that result from fossil fuel combustion. Improve understanding of the terrestrial biosphere's role in the uptake of carbon dioxide (i.e., the carbon exchange between the atmosphere and forests).

- o Complete evaluation of data obtained in field campaign at land/ocean interface.

- o Synthesize initial results from experimental and observational studies to quantify responses of southern hardwood forest and arid land ecosystems to alterations in precipitation.

- o Initiate a Young Scientists Award Program to strengthen global change research infrastructure at universities and national laboratories.

- o Complete regional analysis to identify ecological systems most sensitive to climatic variation and change to provide improved assessments of consequences of climate change.

- o Funding in the amount of $2,126,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

Climate and Hydrology (+$2,463,000) - The Atmospheric Radiation Measurement (ARM) program will continue to develop and operate the planned ARM sites, including the second and third sites located in the Tropical Western Pacific and the North Slope of Alaska, respectively. Activities within CHAMMP, the UAV-ARM program, and relevant parts of NIGEC will proceed at levels appropriate to their scientific priorities and urgencies.

Atmospheric Chemistry and Carbon Cycle (-$1,868,000) - Activities within Marine Transport/Ocean Margins have focused on the role of coastal oceans as a source or sink for atmospheric carbon dioxide and the processes controlling the uptake, transport, and sequestration of carbon in the coastal ocean. Studies have included the use of biomarkers, measures of bacterial respiration, and studies of biogeochemical processes at the land/water interface. Research involving the development and application of such molecular and biological methods will be supported in the context of the synergistic and complementary research areas under the environmental remediation subprogram.

Ecological Processes (-$349,000) - Experimental and observational studies will continue at a reduced pace. The program scope is maintained.

Human Interactions (+$477,000) - Integrated assessment studies targeted at the science-based understanding of the implications of fundamental research in issues related to environmental processes will be strengthened. Newly initiated activities directed towards the inclusion and development of minority students in peer-reviewed research focused on environmental processes will be maintained.

ENVIRONMENTAL REMEDIATION
(Tabular dollars in thousands. Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The research is focused on the understanding of the fundamental physical, chemical, geological, and biological processes that must be marshaled for the development and advancement of new, effective, and efficient processes for the remediation and restoration of the Nation's nuclear weapons production sites. Priorities of this research include bioremediation, the development of the full capabilities of the Environmental Molecular Sciences Laboratory, and the joint scientific endeavors with the Office of Environmental Management. The subprogram also includes basic research in support of pollution prevention and sustainable technology development.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Terrestrial Transport	$ 18,220	$ 23,313	$ 29,053	$+ 5,740	+ 24.6%
Total, Environmental Remediation	$ 18,220	$ 23,313	$ 29,053	$+ 5,740	+ 24.6%

III. Performance Summary:

FY 1995 Accomplishments:

- o Expanded bioremediation research and initiated studies of the use of genetically engineered microorganisms (GEMs) for degrading contaminants, moving the research from the laboratory to a controlled field site at Oak Ridge National Laboratory.
- o Developed a 10-year plan for basic bioremediation research to clean sites fouled during nuclear weapons production (NABIR: Natural and Accelerated Bioremediation Research).
- o Funding in the amount of $353,000 and $17,000 has been transferred to the SBIR and STTR programs, respectively.

III. Performance Summary: ENVIRONMENTAL REMEDIATION (Cont'd)

FY 1996 Accomplishments (to date and planned):

o Initiate research activities identified in the 10-year plan on bioremediation, including establishment of an interagency advisory group.

o Link research on the physical, chemical, and geological studies of contaminant transport with related activities in the Office of Technology Development/Office of Environmental Management (OTD/EM) and in the Office of Basic Energy Sciences/Energy Research (BES/ER).

o Initiated pilot program focused on fundamental research needs identified by the Office of Environmental Management but, by virtue of the fundamental and basic nature, fall within the mission responsibility of the Office of Energy Research.

o Funding in the amount of $824,000 and $66,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

o Complete genome sequence of three thermophilic microbes to identify and isolate genes and proteins that will enhance the bioremediation of mixed contaminants.

o Begin the long term research necessary to identify key microbial, biotransformation, and biogeochemical processes to enhance the utility of bioremediation and develop strategies to represent these processes in predictive models.

o Begin identification of the three field research centers proposed in the bioremediation plan; initiation of activities at the first center.

o Initiate Environmental Molecular Sciences Laboratory (EMSL) startup operations.

o Funding in the amount of $1,193,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

(+$5,740,000) - Research will seek to improve understanding of the potential of subsurface microorganisms for environmental bioremediation. With the establishment of the Environmental Molecular Sciences Laboratory, unified efforts within this subprogram will provide research directions that capitalize on the interdisciplinary nature of the fundamental science supporting environmental cleanup.

MEDICAL APPLICATIONS AND MEASUREMENT SCIENCE
(Tabular dollars in thousands. Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The medical applications programs support research to develop beneficial applications of nuclear and other energy-related technologies for medical diagnosis and treatment. The research develops applications of radiotracer agents in medical research using recent advances in instrumentation as well as in molecular and structural biology. A major emphasis is placed on non-invasive diagnostic tools, including imaging technologies such as positron emission tomography. The research in this activity is conducted in six specific areas: Radioisotope Development, Radiopharmaceuticals, Instrumentation, Clinical Feasibility, Boron Neutron Capture Therapy (BNCT), and Molecular Nuclear Medicine.

The measurement science program also focuses on research and development of new measurement technologies to meet the needs of the environmental and life sciences programs of the biological and environmental research programs and other departmental customers. Emphasis is placed on using the advanced technologies developed in the Department's National Laboratories for environmental and biomedical research. The dosimetry activity is devoted to providing fundamental understanding of interactions of radiation with matter needed to improve BNCT and other programs in medical applications and the life sciences.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Medical Applications	$ 47,285	$ 52,206	$ 36,720	$- 15,486	- 29.7%
Measurement Science	4,799	4,985	5,875	+ 890	+ 17.9%
Total, Medical Applications and Measurement Science	$ 52,084	$ 57,191	$ 42,595	$- 14,596	- 25.5%

III. Performance Summary: MEDICAL APPLICATIONS AND MEASUREMENT SCIENCE (Cont'd)

FY 1995 Accomplishments:

- o Initiated three human clinical trials at Brookhaven National Laboratory, New England Medical Center, and Ohio State University of the safety and efficacy of boron neutron capture therapy (BNCT) for treatment of glioblastoma brain cancer and melanoma skin cancer with new boron labeled drugs.

- o Inaugurated two research centers for the medical applications of advanced imaging technologies: a center for functional imaging at the Lawrence Berkeley National Laboratory for the study of human chemistry, physiology and disease; and a center for imaging neuroscience at Brookhaven National Laboratory for the study of neurological disorders and mental illnesses.

- o Initiated research on three-dimensional positron emission tomography at Lawrence Berkeley National Laboratory that will have the highest resolution and be the fastest system in the world, for improved diagnosis of brain diseases.

- o Completed initial collaborative projects between Centers of Excellence for Laser Applications in Medicine at Massachusetts General Hospital, Schepens Eye Research Institute, University of California at Irvine and the University of Texas, and DOE National Laboratories to develop laser technology for medical diagnosis and treatment such as burn treatment, laser surgery and cancer treatment.

- o Completed follow up and evaluation of the health status of 1,300 human research patients treated at the Lawrence Berkeley National Laboratory with charged-particle radiosurgery between 1954 and 1993 for selected brain disorders. Techniques and treatment strategies are being transferred to the Proton Irradiation Facility at Loma Linda University Medical Center.

- o Radiopharmaceutical research focused on targeting the multi-drug resistance gene.

- o Developed new approaches in genetic engineering and tumor biology that contribute to more efficient and selective cancer treatment options.

- o Received Research and Development magazine R&D 100 award for a fast and inexpensive test for polychlorinated biphenyls (PCBs) that enables rapid in-field testing for PCBs.

- o Completed research on instruments for the measurement of radiation and solicited research applications to investigate the chemical composition of living cells and to probe the subsurface environments.

III. Performance Summary: MEDICAL APPLICATIONS AND MEASUREMENT SCIENCE (Cont'd)

- o Initiated collaborative project with the National Science Foundation to develop instrumentation for ocean carbon measurements as part of the basic research program in instrumentation for measurement sciences.

- o Funding in the amount of $965,000 and $48,000 was transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- o Complete a Phase I/II human clinical trial of boron neutron capture therapy at Brookhaven National Laboratory for treatment of glioblastoma using the recently developed boronophenylalanine-fructose complex as the boron delivery drug.

- o Use new radiotracers and imaging capabilities for neuroscience research and for diagnosing diseases and disorders of the brain and other organs.

- o Develop new diagnostic probes for detection of cancer using advanced molecular biology techniques.

- o Complete installation of a high-field, whole body magnetic resonance imaging system at the Brookhaven Imaging Center which, along with emission computed tomography instruments, provides complementary multiple imaging modalities for studies on the function of the human brain in normal, aging and diseased states, and following drug abuse.

- o Deploy new instrumentation for characterizing particulate matter in the oceans to determine the distribution and fate of carbon-containing matter in the global carbon cycle.

- o Complete development of new biosensors capable of measurements in individual biological cells that enable studies of disease processes.

- o Development of high resolution three-dimensional positron emission tomography at Lawrence Berkeley National Laboratory will continue.

- o Continue research into new concepts for imaging of effects of carcinogens on biological materials.

- o Initiate basic dosimetry research directed to improvement of Boron Neutron Capture Therapy and other health science programs of the Office.

III. Performance Summary: MEDICAL APPLICATIONS AND MEASUREMENT SCIENCE (Cont'd)

- o Funding for the Biomedical Research Foundation of Northwest Louisiana is provided to develop a research program on stroke and related diseases as included in Congressional direction.

- o Funding for the Oregon Health Sciences University is provided in support of networking infrastructure at the university and collaborations with related institutions, as included in Congressional direction.

- o Funding in the amount of $1,151,000 and $88,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- o Bring new radiopharmaceuticals with high specificity for particular cells into biological screening and preclinical studies in laboratory animals.

- o Strengthen computational modeling efforts in support of drug design for molecular nuclear medicine applications.

- o Complete a Phase I human clinical trial at Ohio State University of boron neutron capture therapy for treatment of glioblastoma using sodium borocaptate as the boron delivery drug; this compound has been widely used in Japan.

- o Collaborate with the National Cancer Institute in comparing boron neutron capture therapy with conventional modes of therapy.

- o Extend laser research to develop beneficial medical laser applications for diagnosis and therapy of cancer and other diseases. Complete a CRADA between Sandia National Laboratory and Massachusetts General Hospital on development of laser technology for diagnosis and treatment of burns, and transfer the technology to the private sector.

- o Continue development of information management systems for medical applications, leading to initial applications of genome sequencing in radiopharmaceutical development.

- o Continue development of three dimensional positron emission tomography and associated electronics and new crystal materials.

- o Complete development of a new mass spectrometer capable of characterizing contaminants in subsurface environments.

III. Performance Summary: MEDICAL APPLICATIONS AND MEASUREMENT SCIENCE (Cont'd)

- o Complete development of new laser based techniques for measurement of chemical carcinogens at subcellular level to enable studies of how a cell evolves from the normal to the cancerous state.

- o Continue program in dosimetry applied to BNCT.

- o Funding in the amount of $1,058,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

Medical Applications (-$15,486,000) - Congressionally directed projects included in FY 1996 are complete. Projects in radiopharmaceutical development using conventional antibody approaches will be terminated.

Measurement Science (+$890,000) - Support for the development and application of laser technologies developed by the National Laboratories will increase to couple these technologies more closely to medical applications of optical techniques.

BIOLOGICAL AND ENVIRONMENTAL RESEARCH PROGRAM

RELATED CAPITAL FUNDING
(Tabular dollars in thousands. Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

Provides for the necessary capital equipment and general plant project needs to support the BER program. An ability to address health and environmental issues requires a continuing commitment to maintaining advanced instrumentation and facilities.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 24,834	$ 24,439	$ 23,675	$- 764	- 3.1%
General Plant Projects	4,217	3,613	4,837	+ 1,224	+ 33.9%
Facility Modifications and Improvements	0	0	1,500	+ 1,500	0%
Total, Facilities	$ 29,051	$ 28,052	$ 30,012	$+ 1,960	+ 7.0%

III. Performance Summary:

FY 1995 Accomplishments:

o Provided Capital Equipment (CE) funding in support of the research program.

o GPP funding provided for minor new construction, other capital alterations and additions, and for buildings and utility systems, to maintain the productivity and usefulness of Department-owned facilities and to meet its requirements for safe and reliable facilities operation.

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

FY 1996 Accomplishments (to date and planned):

o Provide Capital Equipment (CE) funding in support of the research program.

o GPP funding for minor new construction, other capital alterations and additions, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

FY 1997 Planned Accomplishments:

o Provide Capital Equipment funding in support of the research program.

o GPP funding for minor new construction, other capital alterations and additions, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

o Facility modifications and improvements are necessary to ensure continued safe operation and reliability of reactors for boron neutron capture therapy. Additions and improvements to the radioisotope production laboratory at the Brookhaven Linac Isotope Producer (BLIP) facility are required to ensure a continuous and reliable supplies of accelerator produced radioisotopes for research. Modifications include additional state-of-the-art hot cells and an improved waste neutralizer/solidifier system.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $1,960,000 is related to the initiation of facility modification activities described above and the added responsibility of GPP and GPE funding for Oak Ridge Institute for Science and Education formerly provided by the Multiprogram Energy Laboratories - Facilities Support program.

BIOLOGICAL AND ENVIRONMENTAL RESEARCH PROGRAM

CONSTRUCTION
(Tabular dollars in thousands. Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

Construction is needed to support the BER Research program. Experiments necessary to support basic research require that state-of-the-art facilities be built or existing facilities modified to meet unique research requirements.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Construction	$ 67,200	$ 62,595	$ 36,113	$- 26,482	- 42.3%
Total, Facilities	$ 67,200	$ 62,595	$ 36,113	$- 26,482	- 42.3%

III. Performance Summary:

FY 1995 Accomplishments:

- o Completed construction of laboratory/office complexes for visiting scientists at the National Synchrotron Light Source and the Stanford Synchrotron Radiation Laboratory (SSRL) to increase opportunities for scientists from universities, industry, and government to determine the structures of important proteins.
- o Continued construction of user center for structural biology at Advanced Light Source (ALS).
- o Continued construction of the Structural Biology Center at the Argonne National Laboratory (ANL).
- o Continued construction of the Environmental Molecular Sciences Laboratory (EMSL).
- o Completed upgrade of beam current, replaced the target assembly, and improved the hot cell shielding at the Brookhaven Linac Isotope Producer (BLIP).

III. Performance Summary: CONSTRUCTION (Cont'd)

o Continued construction of the Human Genome Laboratory at the Lawrence Berkeley National Laboratory (LBNL).

FY 1996 Accomplishments (to date and planned):

o Complete construction of the User Center for Structural Biology at the Advanced Light Source (ALS) and the Structural Biology Center at the Argonne National Laboratory.

o Continue construction of the EMSL.

o Continue construction of the Human Genome Laboratory at LBNL.

FY 1997 Planned Accomplishments:

o Complete construction of the EMSL.

o Complete construction of the Human Genome Laboratory at LBNL.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $26,482,000 in Construction is due to the completion of construction activities at the two Structural Biology Centers, and the final year construction costs for the EMSL and the Human Genome Laboratory.

1998	0	0	0	2,696

a/ Reflects reduction of funding for the FY 1994 rescission.

1. Title and location of project:	Human Genome Laboratory Lawrence Berkeley National Laboratory (LBNL) Berkeley, California	2a. Project No. 94-E-339 2b. Construction Funded

8. Project Description, Justification and Scope

The proposed Human Genome Laboratory will be a three-story building with 41,000 gross square feet and 24,050 net square feet of assignable laboratory and office space. It will be located at the Lawrence Berkeley National Laboratory (LBNL) near the existing Biomedical Laboratory and the Cell Culture Laboratory.

The project was designed and sited in general conformance with the Long Range Development Plan approved by the U.C. Board of Regents in 1987 and with the LBNL Site Development Plan approved by DOE in 1991. The conceptual design documents and cost estimate for the project were prepared from design criteria submitted by the Life Sciences Directorate and Human Genome Center staff.

The structure will be comprised of a braced steel frame with concrete floors and roof supported on metal deck, and exterior glass fiber reinforced concrete panel walls. An HVAC system with 100% outside air supply will be provided. The building will be protected by a fire sprinkler system connected to the LBNL alarm system. Fire alarm stations will be provided on each floor with smoke detectors in all corridors and other areas where required. All utilities are available at the site except for a required substation to step down the available 12 kV from a new LBNL substation. Fifty foot-candle lighting in laboratories will be provided by fluorescent fixtures with high frequency electronic ballasts. Access to the site is available via existing Cyclotron Road. Parking will be provided adjacent to the front entry and in the new 20 car parking area behind the Biomedical Laboratory.

Functionally, the Human Genome Laboratory is designed to provide a state-of-the-art facility for molecular genetics research. Each floor will house open laboratory areas furnished with modular wet benches and desks for maximum flexibility. This design will accommodate future modifications required by scientific investigations or changes in program.

Adjacent to laboratory areas will be a core of support facilities including cold rooms, dark rooms, cell tissue rooms, autoclaves and laboratories for robotics, instrumentation and computation. Laboratory offices and secretarial stations will be comprised of demountable open space workstations. To facilitate the interaction between researchers, a small shared conference room will be provided on each floor and a large conference room seating 25-30 people and combined with library is located on the first level.

The building is designed in compliance with the requirements for H-7 occupancy as defined by the Uniform Building Code. All code stipulated provisions for handling and storage of hazardous materials are incorporated.

1.	Title and Location of Project:	Human Genome Laboratory Lawrence Berkeley National Laboratory (LBNL) Berkeley, California	2a. Project No. 94-E-339 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

These new government-owned facilities will be located on land owned by the University of California and will serve or be operated in conjunction with other government-owned facilities at the Lawrence Berkeley National Laboratory.

The Human Genome Laboratory at LBNL will support the Department of Energy's program to develop and apply the powerful tools of molecular genetics towards understanding the health and environmental impacts of current and proposed energy technologies. Research conducted at the Laboratory will provide a fundamental understanding of the structure and function of the human genome--the genetic basis of susceptibility to disease causing agents--for use in defining risk and providing health protection. To achieve these objectives will require the Human Genome Laboratory to be directed towards the goals of identifying the variability in genetic information encoded in deoxyribonucleic acid (DNA) and mapping its arrangement on the 23 pairs of human chromosomes. The long-term goal of the national program is to support the determination of the sequence--and variation--of the approximately three billion DNA bases that comprise the total chromosome material of human cells.

The Human Genome Laboratory requires an essential core of laboratories for multidisciplinary teams of technical staff that utilize a common pool of instrumentation and cell culture facilities. This building will be adjacent to existing cell biology research facilities (the Biomedical Laboratory Building and the Cell Culture Laboratory) that are used for related research on gene expression and physiology. This and other light laboratory space at Lawrence Berkeley National Laboratory is now fully utilized. The Human Genome Laboratory is planned for a staff of 92, including senior scientists, postdoctoral associates, graduate students, technicians and support personnel.

Research at the Human Genome Laboratory will directly support the needs of the DOE Biological and Environmental Research program for gene mapping and DNA base sequencing and its related efforts to improve analytical methods, instrumentation and information management. Program activities conducted in the laboratory building will facilitate and improve mapping of selected human chromosome fragments; establish selected libraries of DNA nucleotide bases (complementing other libraries of cloned genes); conduct pilot nucleotide base sequencing of sections of continuous megabase-length DNA; develop data banks and analysis software; improve and develop new automation of mapping and sequencing techniques; and develop innovative methods for detecting gene fragments, sequences and variation. An important corollary activity is to provide requested services to universities and industry, including cloned DNA material, cell lines, and data. The program will contribute information to national gene banks and computational centers and utilize chromosome material from sorting centers at other national laboratories.

1. Title and Location of Project:	Human Genome Laboratory Lawrence Berkeley National Laboratory (LBNL) Berkeley, California	2a. Project No. 94-E-339 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The Human Genome Laboratory will provide light laboratories, equipment rooms, and office space required for the conduct of the integrated mapping, sequencing and analytical support programs. These needs include, for example, biochemistry bench space, controlled environmental chambers, tissue culture facilities and fermenters, and necessary instrumentation areas and utilities for DNA sequencers, gel scanners for separations, oligonucleotide synthesizers to prime fragment analysis, radiotracer counters, and basic preparative and analytical equipment. Special requirements include the control of biological materials and chemicals through laminar flow hoods and non-vented cabinets. Common ducting will be used for all chemical fume hoods and laminar flow cabinets.

The $1,000,000 budgeted for the Human Genome Laboratory in FY 1997 is for the purchase of equipment needed to begin operation of the laboratory, including chemical hoods, sterilizers, DNA sequencers, and robots.

9. Details of Cost Estimate a/

	Item Cost	Total Cost
a. Design and management costs		$ 2,330
1. Engineering design and inspection at 16 percent of construction costs	$ 2,330	
b. Land and land rights		0
c. Construction Costs		14,474
1. Improvements to Land	$ 1,680	
2. Buildings (37,000 GSF at approximately $298/sq. ft.)	11,054	
3. Special Facilities	1,520	
4. Utilities	220	
5. Project Management		1,020
d. Standard Equipment		3,080
e. Relocations		300
Subtotal		$21,204
f. Contingencies at approximately 16 percent of above costs		3,430
Total line item cost		$24,634

a/ Construction costs have been escalated at 2.1% for FY 1992; 3.4% for FY 1993; 4.3% for FY 1994; 4.5% for FY 1995 and 4.7% for FY 1996, compounded to midpoint of construction, August 1996.

Lawrence Berkeley National Laboratory (LBNL)
Berkeley, California

2a. Project No. 94-E-339
2b. Construction Funded

10. Method of Performance

Design will be accomplished by means of a negotiated architect-engineer subcontract. Construction and procurement will be accomplished by fixed price subcontract awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1994	FY 1995	FY 1996	FY 1997	FY 1998	Total
a. Total project costs							
1. Total facility costs							
(a) Line item	$ 0	$ 518	$ 2,274	$ 9,850	$ 9,296	$2,696	$24,634
2. Other project costs							
(a) Conceptual design costs	$ 70	$ 0	$ 0	$ 0	$ 0	$ 0	$ 70
(b) Environmental and safety documentation costs	100	130	0	0	0	0	230
Total project costs (TPC)	$ 170	$ 648	$ 2,274	$ 9,850	$ 9,296	$2,696	$24,934

b. Related annual funding requirements in FY 1998 dollars

1. Facility operating costs	$ 470
2. Programmatic operating expenses for research	12,200
3. Capital equipment required for programmatic research	530
Total related annual costs in FY 1998 dollars	$13,200

840

1. Title and Location of Project:	Human Genome Laboratory Lawrence Berkeley National Laboratory (LBNL) Berkeley, California	2a. Project No. 94-E-339 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs

The major elements of the Human Genome Laboratory have been described in Item 8.

The construction funding profile has been determined after analysis and review of a comprehensive project schedule, taking into account the earliest anticipated receipt of fiscal year funding, A/E selection time frame, general weather conditions for both site work and structure generally encountered in the San Francisco Bay area.

2. Other project costs

(a) Conceptual design costs--Includes costs for preparation of conceptual design report (CDR) by LBNL personnel.

(b) Environmental (NEPA) and Safety (SAR) documentation costs--Includes costs for environmental evaluation and, if required, preparation of an Environmental Assessment (EA). Safety documentation includes preparation of preliminary safety analysis documents (PSAD).

b. Related annual costs

1. Facility operating costs

Includes estimated cost for maintenance, custodial service, and utilities such as light, heat and water.

2. Programmatic operating expenses for research

The annual costs of the scientific program are increased progressively to assemble a high-quality research staff for the Human Genome Laboratory consistent with the national program. Funding in the early years of the project will attract senior scientists to lead the new scientific programs described in Item 9. These researchers can be housed initially in leased facilities if necessary until the Human Genome Laboratory is completed. The programs will expand to include the full complement of scientists and technicians upon project completion.

1. Title and Location of Project:	Human Genome Laboratory Lawrence Berkeley National Laboratory (LBNL) Berkeley, California	2a. Project No. 94-E-339 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (Continued)

3. Capital equipment required for programmatic research
   The capital equipment needs related to this research staffing profile reflect program requirements and experience that equipment items will be needed at the level of approximately 20% of the operating program budget. These amounts are augmented in the initial years for specialized capital equipment start up costs.

c/ Adjustments reflect a $30,000 general reduction for FY 1991 and a rescission of $983,000 for FY 1994..

1. Title and Location of Project:	Environmental Molecular Sciences Laboratory, Pacific Northwest National Laboratory Richland, Washington	2a. Project No. 91-EM-100 2b. Construction Funded

8. Project Description, Justification and Scope

The Environmental Molecular Sciences Laboratory (EMSL) project will be a laboratory facility with an initial complement of laboratory equipment. EMSL will be an extension of the current environmental mission at the Hanford site, providing a focused laboratory capability to develop technology solutions to Hanford site-specific environmental restoration and waste management problems as well as the related needs at other departmental facilities. The new facility will be located at the north end of a technology corridor at the Hanford site, facilitating access to existing radiological facilities (hot cells and laboratories) and enabling interactions with both other scientists at the Pacific Northwest National Laboratory and scientists and engineers working at the nuclear processing and storage facilities. This strategic location will facilitate linking Hanford problems to technology needs and facility requirements as well as provide dedicated laboratory capability at the Hanford Site for the full duration of site environmental restoration efforts.

The facility size is approximately 200,000 square feet, housing 209 permanent scientific and support staff, and 60 visiting scientists. Key facility elements include laboratories, offices, conference rooms, computer and graphics rooms; library, kitchen, support shops, and a seminar area. Facility design will support state-of-the-art laboratory equipment, provide flexibility to accommodate future equipment, and support educational and technology transfer initiatives.

Laboratory equipment consists of the research equipment and computer systems required to achieve planned research and technology development objec nt objectives. Key laboratory equipment includes molecular-level surface chemistry equipment, laser-based spectroscopy equipment, advanced processing equipment, sensor development and evaluation equipment, material testing and evaluation equipment, Ultra High Field Nuclear Magnetic Resonance System, advanced mass spectrometers, data base computer, high performance computer and an advanced computer information system.

FY 1997 funds requested will be used for project management and support, continued construction of the laboratory facility, and continued acquisition of research and computer equipment.

1. Title and Location of Project:	Environmental Molecular Sciences Laboratory Pacific Northwest National Laboratory Richland, Washington	2a. Project No. 91-EM-100 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The purpose of the Environmental Molecular Science Laboratory (EMSL) is to provide the fundamental science that will lead to new technology for current and future Hanford site-specific environmental restoration and waste management problems, as well as for those at other sites contaminated during nuclear weapons production. Mission need for EMSL is based on Hanford site-specific technology development needs defined in detailed technology logic diagrams. These logic diagrams link Hanford site-specific problems to technology needs and facility requirements; define the role of existing, modified, and new facilities at the Hanford site, including EMSL; and provide a basis for defining and integrating EM technology development needs on a national scale.

The EMSL will focus on a wide variety of experimental and theoretical capabilities in an interdisciplinary culture that will: 1) develop the scientific basis to predict contaminant transport and transformation; 2) advance materials technologies for measurement, containment, and separation of wastes; 3) increase use of biosystems for remediation and knowledge of health effects due to toxic substances; 4) facilitate training, education, and technology transfer initiatives; and 5) achieve transfer of technology through industry involvement.

The $35,113,000 budgeted to complete the project in FY 1997 will be used for the purchase of final research and computer equipment, installation and testing of research and computer equipment, completion of the facility, and research and computer equipment, readiness assessment, and continuating and completion of startup operations including initial staffing, personnel training, personnel moves and occupancy of the facility, stocking of initial consumables for full operation, and other related startup operations activities.

1. Title and Location of Project:	Environmental Molecular Sciences Laboratory Pacific Northwest National Laboratory Richland, Washington	2a. Project No. 91-EM-100 2b. Construction Funded

9. Details of Cost Estimate a/	Item Costs	Total Cost
a. Design and cost management		$ 52,670
1. Facility engineering, design, and inspection at approximately 15.5 percent of construction costs items c and d	$ 8,320	
2. Research & computer equipment engineering, design and inspection	39,050	
3. Construction management at approximately 9.9 percent of items c & d	5,300	
b. Land and land rights		0
c. Construction costs		51,390
1. Improvements to land	2,880	
2. Buildings ($208.63/sq ft based on 202,365 gross sq ft)	42,220	
3. Utilities (including water electrical power and sewers)	1,250	
4. Special facilities	5,040	
d. Standard equipment (furnishing and standard lab and shop equipment)		2,330
e. Computer equipment (see below for details)		20,360
f. Research equipment		47,390
g. Project management		19,420
Subtotal b/		193,560
h. Contingency at approximately 7.4 percent of all above costs		14,340
Total line item cost		$207,900

a/ This estimate is based on the most recent cost estimate dated February 1994.

b/ Includes escalation applied to facility construction at the rates of 3.7% (FY 1994), 3.8% (FY 1995), 3.8% (FY 1996), and 4.3% (FY 1997) to midpoint of construction and procurement.

2a. Project No. 91-EM-100
2b. Construction Funded

10. Method of Performance

Conventional facility design and inspection will be completed under a negotiated architect-engineer (AE) contract. Facility construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bidding. Research equipment and computers will be procured on a competitive bid basis by PNNL. However, approximately 10 percent of the research and computer equipment does not exist in the current commercial market and will be provided by PNNL.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1994	FY 1995	FY 1996	FY 1997	TOTAL

1. Title and Location of Project:	Environmental Molecular Sciences Laboratory Pacific Northwest National Laboratory Richland, Washington	2a. Project No. 91-EM-100 2b. Construction Funded

11. Schedule of Project Funding and Other Related Funding Requirements (Continued)

b.	Related annual funding (Estimated Life of Facility: 40 years) a/	
1.	Facility operating costs	$ 28,000
2.	Programmatic costs directly related to the facility	35,000
3.	Capital equipment required to maintain state-of-the-art capability	2,000
4.	GPP or other construction related to programmatic effort in the facility	500
	Total related annual costs	$ 65,500

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   - (a) Construction line item -- Includes estimated cost for conventional facility design and construction, initial complement of research equipment and computers, and project management -- $207,900,000
   - (b) Operating Expense Funded Equipment -- None
   - (c) Inventories -- Inventories necessary to put the facility into use are included in operating costs.
   - (d) Non-Federal Contribution -- None.
2. Other project costs
   - (a) R&D necessary to complete construction -- Includes the conceptual design and prototype development of specific items of the research and computer equipment required to permit specification of the final equipment to be procured and installed in the EMSL -- $9,410,000
   - (b) Conceptual design was completed during FY 1988 and revised in FY 1989 to incorporate DOE comments. An alternate design was developed during FY 1990 for a total of -- $1,540,000
   - (c) Other project related costs -- Includes the estimated operating contractor costs associated with the construction line item for the following: (a) operational readiness review, (b) relocation of R&D equipment, and (c) software required for fully functional facility computer system -- $6,250,000
   - (d) Programmatic capital equipment includes research and computer equipment necessary for R&D required for construction -- $4,800,000

a/ Estimated costs in thousands escalated to FY 1997 dollars.

1. Title and Location of Project:	Environmental Molecular Sciences Laboratory Pacific Northwest National Laboratory Richland, Washington	2a. Project No. 91-EM-100 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (Continued)

b. Other related annual costs

Annual related funding requirements will vary as research and operations are implemented, the new facility is occupied at the end of FY 1996, and steady-state operation is attained in FY 1998. The estimated total related funding requirements are identified in Section 12.B and discussed below:

1. Facility operating costs -- The estimated annual facility operating costs include all personnel, materials, and resources required to support operation of a high technology DOE user facility. The annual facility operating estimate is comprised of the following expense elements:

Utilities and building maintenance a/

ADP operations and upkeep:

Maintenance contracts (approximately 10 percent of capital costs)	$ 4,000
Staff operations/support	9,000
Materials and supplies	1,000
Subtotal ADP operations and upkeep	14,000

a/ Utilities and building maintenance estimated cost is $3,000,000. This is an indirect cost recovered via a Buildings & Utility (B&U) overhead applied to all PNNL staff working in EMSL and is included in programmatic and facility operating costs.

850

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (Continued)

Research equipment operations and upkeep:

Maintenance contracts (approximately 10 percent of capital costs)	7,000
Staff operations/support	4,000
Materials and supplies	3,000
Subtotal research equipment operations and upkeep	14,000
Total Facility Operating Costs	$28,000

2. Programmatic research costs directly related to the facility -- The estimated programmatic operating costs include all personnel, materials, capital equipment and resources required to perform environmental and molecular sciences research for the following customers; DOE Office of Energy Research, DOE Office of Environmental Management, other DOE offices and other federal agencies, and private industry -- total $35,000,000.

3. Capital equipment required to maintain state-of-the-art capability facility -- To maintain viable research programs, it will be necessary to update research equipment and computers to keep pace with the rapid change of technology in these areas. This estimate includes costs to maintain programmatic related research equipment and computers at state-of-the-art level - $2,000,000.

4. GPP or other construction related to programmatic effort -- It is expected that alterations will be required beginning in FY 1997. This estimate is approximately 1% of the initial facility cost and will be required to make facility modifications to accommodate specific user experiments, relocate and/or modify existing research equipment and install new latest generation research equipment -- $500,000.

FUSION ENERGY SCIENCES

PROGRAM MISSION

The Fusion Energy Sciences program is undergoing a major change following guidance from Congress on budget constraints and program focus. Based on the recommendations of the Fusion Energy Advisory Committee in its report on "A Restructured Fusion Energy Sciences Program" (January 1996), the program is being rapidly restructured to focus on the scientific foundations which underpin the fusion process. The Department has accepted the major recommendations of the FEAC report, although the full $275,000,000 program recommended by the Committee could not be provided within constrained budgets. The new mission of the Fusion Energy Sciences Program is to:

"Advance plasma science, fusion science, and fusion technology -- the knowledge base needed for an economically and environmentally attractive fusion energy source."

The Department's intent is to establish the scientific knowledge base from which a fusion energy technology development program could be undertaken, when appropriate. In pursuing this mission, the fusion program will also foster the advancement of basic plasma science and associated technologies, which have wide applications to other fields of science and to industry.

The policy GOALS of the FUSION ENERGY SCIENCES program are to:

Advance plasma science in pursuit of national science and technology goals

Develop fusion science, technology, and plasma confinement innovations as the central theme of the domestic program

Pursue fusion energy science and technology as a partner in the international effort

PROGRAM MISSION - FUSION ENERGY SCIENCES (Cont'd)

The OBJECTIVES related to these goals are:

1. Advance Plasma Science

The Fusion Energy Sciences program will assume a leadership role within DOE and among other parts of the government in coordinating and strengthening scientific research efforts in basic plasma science. It will build and strengthen this segment of the program to an increased level.

2. Pursue Fusion Science and Technology Through Innovation

The program will maintain and strengthen fusion science core research activities with a focus on innovation in both tokamaks and alternative concepts. The unique science associated with confining ionized gases at stellar temperatures presents a complex range of theoretical, computational, and experimental challenges which require specialized facilities for their resolution. Existing experimental facilities will be used to maximum advantage in carrying out fusion science research efforts; older facilities will be phased out to free up resources for exploration of new scientific areas. Research on enabling technologies such as heating and fueling systems is an integral part of advancing fusion science. Innovation in both science and enabling technologies will be emphasized as the most cost-effective means to achieve the long range goal of developing a practical energy source. Additional cost-effectiveness will be derived from continued and expanded use of international collaboration in virtually all of these technical efforts.

3. Maintain a Partnership Role in International Fusion Energy Development

International collaboration is now focused on the scientific basis, technology development and engineering design necessary to construct a burning plasma experiment, ITER, whose ultimate objective is to demonstrate the scientific and technological feasibility of fusion energy. Within the restructured program, we will meet our commitment to the successful completion of the ITER Engineering Design Activities in July 1998. The Department intends to maintain the option of participation in construction in a way consistent with U.S. program needs and financial limitations. Consequently, the Department is initiating an interagency process seeking government authorization to enter pre-negotiations, non-committal discussions with the other ITER Parties called Explorations on whether acceptable construction arrangements could be envisioned. As part of this approach, given the financial limitations, the Department will not seek to be the host of the ITER facility.

Research on key technologies, such as radiation resistant, low-activation materials, is central to fusion's ultimate environmental and economic attractiveness as an energy source, and is being pursued in collaboration with our international partners.

PROGRAM MISSION - FUSION ENERGY SCIENCES (Cont'd)

PERFORMANCE MEASURES:

The performance measures for a scientific program are primarily qualitative rather than quantitative. The scientific excellence is continually assessed by expert panels, by peer reviews, by publication in scientific journals, and by presentations in international meetings and workshops. Specific performance measures for FY 1997 are:

1. Establish a Basic Plasma Science program as part of a multi-agency effort aimed at support of fundamental science issues associated with the plasma state of matter.

2. Assess scientific progress on the Tokamak Fusion Test Reactor to determine whether to continue the experiments on enhanced energy confinement through FY 1997 or whether to stop operations and begin preparing for decommissioning.

3. Complete and review jointly with our international partners the ITER Detailed Design Report, including cost estimate and safety assessment.

854

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

1. The world's first opportunity to study the detailed science associated with the production of fusion power has occurred over the last year on the Tokamak Fusion Test Reactor at Princeton. This device has achieved over 10,000,000 watts in a one second pulse of fusion power and provided numerous refined measurements of the fusion heating process. Also, unique diagnostic probes and improved theoretical analyses have contributed to much improved performance of the tokamak facilities needed for high temperature plasma experiments. Recent experimental results on TFTR and DIII-D have shown how to reduce the loss of plasma energy and particles to levels previously thought unattainable. These results continue to demonstrate the progress of scientific understanding towards the ultimate objective of developing simpler, more economical fusion power systems.

2. In response to FY 1996 budget reductions by Congress, the design of the Tokamak Physics Experiment was suspended and the project was terminated. Planning for a demonstration power plant has been eliminated. Also, the level of U.S. support for the ITER Engineering Design Activities (EDA) was restructured in consultation with our partners and the Director. Given congressional guidance that future funding will also be constrained, it is clear that any potential role for the U.S. in the future construction and operation of ITER would have to be at a modest level. The initial response from the other ITER parties in this new situation is aimed at finding a constructive, mutually beneficial approach to inclusion of the United States in future construction and operation.

PROGRAM MISSION - FUSION ENERGY SCIENCES (Cont'd)

3. An initiative in basic plasma science is also a significant shift for the program and opens the way for support of a broader research program that will support not only fusion but other elements of the Department's energy and defense missions.

4. The subcommittee, again through FEAC, will also recommend a strategy for increasing the U.S. effort in alternative confinement concept research. This budget includes funds for an innovative new spherical tokamak experiment as a new thrust in this area.

5. As part of the fusion program restructuring, the research efforts on TFTR will be focused on completing the scientific objectives uniquely attainable in that device before shutting down in order to permit increased efforts on tokamak improvements and alternative concepts using other facilities.

6. The Scientific Issues Subcommittee of the FEAC will play a major role in the restructuring of the program. Having identified TFTR as the first of the major facilities to be phased out, this subcommittee, through FEAC, will also recommend how to make the best scientific use of the major tokamaks in FY 1997. It will also review the work in progress at TFTR in mid-FY 1997 to help the Department decide whether to continue the planned experiments through the rest of the year, into FY 1998 at the latest, or whether to stop scientific operation in mid-year and use the remaining FY 1997 TFTR resources to prepare for decommissioning.

7. Funding for the support for the National Energy Research Supercomputer Center has been transferred to the new Computational and Technology Research Program.

FUSION ENERGY SCIENCES

PROGRAM FUNDING PROFILE

Fusion and Plasma Science
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The mission of the Fusion and Plasma Science subprogram is to support fundamental research in plasma physics and to advance the knowledge base in fusion science, especially in the high-leverage areas where the U.S. retains a strong leadership role, such as plasma theory and computation, concept innovation, and plasma diagnostics.

Plasma physics is the study of the behavior of ionized gases -- ranging from fluorescent lights to stars -- that make up 99% of the known universe. It contributes not only to fusion energy research, but also to many national science and technology goals, ranging from astrophysics to industrial processing and national security. One of the objectives of the Fusion and Plasma Science subprogram is to broaden the intellectual and institutional base in fundamental plasma physics and attendant enabling technologies, preferentially in partnership with other agencies.

Fusion science represents a combination of interrelated disciplines that advance through a balance between large- and small-scale experimentation. In this regard the tokamak plasma science activity is focused on gaining a predictive understanding of the behavior of hot confined plasmas using existing U.S. research facilities (e.g., the Tokamak Fusion Test Reactor, Alcator C-MOD, and DIII-D) and through international collaborations on state-of-the-art foreign experimental facilities. Research on alternative confinement concepts will be pursued at the proof-of-principal level to identify confinement approaches which offer insights into tokamak plasma physics and innovations which hold promise for future development as economically and environmentally attractive fusion energy sources.

A particularly critical component of fusion science is the development and use of theoretical and computational tools to provide and verify detailed scientific understanding of the physical phenomena that govern the confinement of high temperature plasmas.

II. Funding Schedule: FUSION AND PLASMA SCIENCES

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Fusion Experimental Research	$165,017	$124,646	$138,333	$+13,687	+ 9.9%
Fusion Theory	16,940	16,634	18,000	+ 1,366	+ 7.6%
Basic Plasma Science	585	220	4,000	+3,780	+94.5%
Total, Fusion and Plasma Science	$182,542	$141,500	$160,333	$+18,833	+ 11.7%

III. Performance Summary: FUSION AND PLASMA SCIENCES

FY 1995 Accomplishments:

- Continued TFTR experiments to study the physics of deuterium - tritium plasmas and achieved another world record, 10.7 million watts of fusion power for about 1 second. Made preliminary observations of plasma self-heating (a key to achieving net energy output in ITER), and energy confinement in deuterium - tritium plasmas.

- Conducted experiments on TFTR and DIII-D that demonstrated improved understanding of the effect of modifying the twist of magnetic field lines, sometimes referred to as reversed sheer, in a tokamak for enhanced confinement.

- Conducted coordinated experiments on DIII-D and the European tokamaks (TEXTOR, ASDEX-UG, and JET) to study the physics of removing helium (a fusion reaction product) from the plasma fuel to maintain its purity.

- Took a pioneering step toward interconnecting major research facilities by operating MIT's Alcator C-Mod tokamak from a remote control room at Lawrence Livermore National Laboratory in California using a high speed computer link.

- Completed a competitive re-evaluation of all small scale toroidal experiments as part of shifting emphasis in small-scale experiments to more innovative alternatives. Began phasing out lower rated experiments.

- Obtained substantial improvement in the computer modeling of experimental results on the Numerical Tokamak Project, a "Grand Challenge" scale computational effort to simulate tokamak physics behavior.

III. Performance Summary: FUSION AND PLASMA SCIENCES (Cont'd)

- Terminated the TPX project in an orderly manner, ensuring documentation of the design and close-out of all industrial contracts.
- Reviewed a proposal from PPPL, ORNL, and the University of Wisconsin to build a National Spherical Tokamak Experiment (NSTX) at Princeton, which would test the merits of an extremely compact, high performance alternative confinement concept.
- Funding in the amount of $3,424,000 and $171,000 have been transferred to SBIR and STTR, respectively.

FY 1996 Accomplishments (to date and planned):

- Analyze data from the world's first series of deuterium - tritium experiments on TFTR. Extend experiments on modifying the twist of magnetic field lines in TFTR and DIII-D to higher temperatures to determine the stability of enhanced confinement.
- Study particle, heat and radiation transport processes in DIII-D to support design of a system to exhaust waste heat from ITER without damaging the surrounding walls or protective surfaces.
- Begin the phase-in of new tokamak improvement and alternate toroidal confinement concept experiments selected as a result of the 1995 competition.
- Make new calculational capabilities available to ITER design personnel to allow more accurate analysis of the behavior of plasmas in the edge of the ITER device.
- Continue to use the Numerical Tokamak Project, the fusion energy "Grand Challenge" initiative, to simulate plasma physics behavior. Work will continue on three dimensional simulations for comparison with experimental data.
- Funding in the amount of $3,070,000 and $230,000 has been provided for SBIR and STTR, respectively.

FY 1997 Planned Accomplishments:

- Take the lead within DOE and work with other Federal agencies to increase both the level of plasma science research and promote recognition as an important research endeavor.

III. Performance Summary: FUSION AND PLASMA SCIENCES (Cont'd)

- Extend the enhanced confinement, or low energy loss, region at the core of TFTR plasmas in size and time duration to increase the self-heating of the plasma using deuterium-tritium (D-T) fuel and make detailed measurements of where in the plasma the self-heating occurs for the use of ITER and other future experiments. This enhanced confinement region is referred to as "reversed shear" because the twist of the magnetic field lines changes. Evaluate feasibility of completing experiments in plasma self-heating and (alpha channelling) in FY 1997.

- Conduct initial experiments using a new high power microwave heating system on DIII-D to locally create and modify barriers to energy loss, enhancing confinement within the tokamak plasma.

- Evaluate results from small-scale innovative confinement experiments to assess their future impact on fusion science and decide on next steps.

- Conduct joint experiments on the TORE SUPRA superconducting experiment in France on the sustained fueling of plasmas for longer pulses.

- Carry out calculations and computer modeling by coordinated, inter-laboratory teams along with international collaborations.

- Funding in the amount of $3,800,000 has been budgeted for SBIR requirements.

Explanation of Funding Changes FY 1996 to FY 1997:

- An additional $8,084,000 for tokamak physics is provided to increase research on the TFTR (+$2,915,000), DIII-D (+$4,405,000), and Alcator C-Mod (+$3,055,000). This will allow investigation of recently discovered enhanced confinement regions and support of key physics design issues for ITER. Minor decreases (-$2,291,000) are allocated over the balance of the program element.

- In response to FEAC recommendations, an increase of $5,603,000 has been provided to substantially increase the support of alternative confinement concepts. A combination of new funds and those from existing experiments will form the basis for a new competitive initiative which will be used to select promising alternative approaches. Enhanced operating schedules for existing small, world class facilities will provide more rapid development of alternative concept physics understanding.

  This initiative will be led by the DOE Fusion Energy Sciences Program and will be coordinated with other DOE programs and other government agencies.

III. Performance Summary: FUSION AND PLASMA SCIENCES (Cont'd)

- An additional $3,780,000 in FY 1997 is provided for a FEAC recommended initiative supporting research for university-scale experiments in basic plasma science.

- An additional $1,366,000 is provided for increased support of theory directed toward alternative confinement concepts and the development of increased computational capability.

Fusion Technologies
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Fusion Technologies subprogram provides the technological foundation for current day fusion science as well as the research and engineering that are required in key technology areas to advance fusion science in the future. Research will be performed in the areas of superconducting magnets, plasma heating and fueling, safety, plasma control, fuel processing and breeding, high current particle beams, heat removal and high performance materials. Research and engineering design in support of the International Thermonuclear Experimental Reactor (ITER) Engineering Design Activities (EDA) is included in this program element. This category includes work on heavy ion beam drivers for use in inertial fusion energy systems. Also included are assessments of critical aspects of integrated fusion systems.

Research on low-activation materials will be focused on high performance fusion system materials capable of withstanding long-term exposure to energetic particles and electromagnetic radiation from fusion plasma reactions.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Fusion Engineering Research	$128,564	$75,417	$75,280	$ - 137	+ 0.2%
Materials Research	9,087	7,560	8,700	+1,140	+13.1%
Total, Fusion Technologies	$137,651	$82,977	$83,980	$+1,003	+ 1.2%

III. Performance Summary: FUSION TECHNOLOGIES

FY 1995 Accomplishments

- TPX engineering design progressed through major subsystem reviews and most R&D tasks were completed to verify the design. orderly closeout of the project began leading to full termination of all contacts in FY 1996.

III. Performance Summary: FUSION TECHNOLOGIES (Cont'd)

- Completed the ITER Central Solenoid Model Magnet Design with the Japanese; delivered initial quantities of ITER superconducting magnet materials.
- With ITER partners, produced the ITER Interim Design Report with site requirements, estimated construction costs and a preliminary safety assessment.
- Demonstrated the feasibility of a high-velocity fusion fuel injector system capable of fueling plasmas for longer pulses, for potential use in future fusion experiments, including ITER.
- Initiated the testing in a tritium environment of components for a fusion fuel cleanup system.
- Completed and published the design of a fusion power plant based on the stellarator concept.
- Prepared a small-scale experiment to test the physics of how energetic ions can be merged into a beam for inertial fusion applications.
- Purchased and began radiation testing of production quantities of a vanadium alloy, one of the low-activation materials selected for potential use in advanced fusion devices.
- Funding in the amount of $3,424,000 and $171,000 has been transferred to SBIR and STTR, respectively.

FY 1996 Accomplishments (to date and planned):

- Complete the production of all superconducting materials required for fabricating the ITER model magnets and complete a manufacturing demonstration of all production steps for the ITER Central Solenoid Model Magnet.
- Continue to work with ITER partners on design and R&D necessary for completing the EDA.
- Complete testing of a vanadium alloy blanket section with high temperature lithium coolant in a magnetic field to demonstrate potential of the concept for breeding fusion fuel.
- Complete a power plant pre-conceptual engineering design using a team of university, national laboratory, and industrial design engineers and physicists.

III. Performance Summary: FUSION TECHNOLOGIES (Cont'd)

- o Complete the initial characterization of selected vanadium alloy based on the tests of irradiated samples and the evaluation of manufacturing techniques.
- o Funding in the amount of $1,581,000 and $111,000 has been provided for SBIR and STTR, respectively.

FY 1997 Planned Accomplishments

- o Complete the U.S. fabrication of the ITER Central Solenoid Model Magnet and make it ready for installation in the Japanese test facility.
- o Issue and review jointly with our partners the ITER Detailed Design Report, including a cost and safety assessment.
- o Complete the comprehensive testing of high heat flux ITER divertor components to establish performance capabilities and demonstrate ITER maintenance and repair procedures for remote replacement of divertor components.
- o Conduct non-neutral plasma experiments to study ion beam focus conditions required for inertial fusion applications.
- o Continue scientific and engineering assessments of various fusion innovations such as reverse shear tokamak confinement and vanadium materials.
- o Complete and review the IEA fusion materials neutron source conceptual design phase study and develop plans for the engineering design, prototype development and testing, and possible construction of a materials test facility as an international project.
- o Funding in the amount of $1,800,000 has been budgeted for SBIR requirements.

III. Performance Summary: FUSION TECHNOLOGIES (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997:

- Additional funds of $1,140,000 for Materials Research will be used to strengthen university programs and continue critical low-activation materials experiments in fission test reactors.
- ITER-EDA activities continue at the FY 1996 level ($54,930,000).
- Systems Studies efforts will decrease by $475,000 to reflect the deletion of demonstration power plant studies. Remaining funds will be used for Concept Evaluation Studies.
- Inertial Fusion Energy research increases $100,000.

FUSION ENERGY SCIENCES

RELATED CAPITAL FUNDING
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

Related capital funding is comprised of Capital Equipment and General Plant Projects (GPP) funding. The former provides essential hardware for the fusion experimental research program. Much of this equipment is used to support the operation of fusion science experiments or to make measurements and gather technical data. Some of this equipment replaces existing obsolete equipment while the remainder is new equipment. The principal element involves the reconfiguration of existing equipment at Princeton Plasma Physics Laboratory into a modest size fusion device called the National Spherical Tokamak Experiment (NSTX), which will be used as a national facility for studying tokamak innovations. Another substantial effort is an upgrade to the DIII-D tokamak with an advanced heat removal system (radiative divertor). When this radiative divertor is installed, DIII-D will be able to test prototype power handling systems for ITER and study current drive techniques relevant to ITER and innovative confinement concepts.

GPP funding represents an essential investment in maintaining the productivity and usefulness of Department-owned facilities and in meeting obligations for their safe and reliable operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project does not exceed $2,000,000.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$11,099	$1,917	$10,287	$ +8,370	+81.4%
General Plant Projects	2,000	1,000	1,000	0	+ 0.0%
Total, Related Capital Funds	$13,099	$2,917	$11,287	$+8,370	+74.2%

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

FY 1995 Accomplishments:

- Provided support for existing tokamak physics experiments at Alcator C-Mod, TFTR, and DIII-D.
- Continued maintenance and modest upgrades to data acquisition systems by replacing or upgrading diagnostics for Alcator C-Mod and DIII-D.
- Procured high power microwave plasma heating system prototypes for DIII-D.
- Performed engineering design of a radiative divertor for future installation on DIII-D.
- Purchased special and general purpose equipment to increase the efficiency and productivity of the research and development efforts and technology test facilities related to the ITER program.
- GPP was provided for minor new construction, other capital alterations and additions, and for buildings and utility systems at PPPL.

FY 1996 Accomplishments (to date and planned):

- Continuing to provide support for existing experiments at TFTR, Alcator C-Mod, and DIII-D.
- Continuing maintenance and modest upgrades to data acquisition systems by replacing or upgrading diagnostics for Alcator C-Mod and DIII-D.
- Completing installation of high power microwave plasma heating systems on DIII-D.
- Starting fabrication of the DIII-D radiative divertor, but at a significantly reduced level.
- Using GPP funds, continuing with buildings and utility systems at PPPL.

III, Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

FY 1997 Planned Accomplishments:

- Initiate fabrication of a modest-scale spherical tokamak experiment (National Spherical Tokamak Experiment) to follow up on theoretical predictions of improved plasma confinement and stability using this alternative concept.
- Continue to provide support for existing experiments at TFTR, Alcator C-Mod, and DIII-D.
- Continue maintenance and modest upgrades to data acquisition systems by replacing or upgrading diagnostics for Alcator C-Mod and DIII-D.
- GPP is provided for minor new construction, other capital alterations and additions, and for buildings and utility systems at PPPL.

Explanation of Funding Changes FY 1996 to FY 1997:

- Overall capital equipment funding is increased by $8,370,000 which will benefit both tokamak physics and alternative concept physics, the former by continuing the radiative divertor upgrade of DIII-D (+$3,300,000), and the latter by completing the design and initiating fabrication of the National Spherical Tokamak Experiment (+$5,000,000). This increase is almost back to the FY 1995 level.

BASIC ENERGY SCIENCES

PROGRAM MISSION

The mission of the Basic Energy Sciences (BES) program is to expand scientific knowledge needed to develop new energy technologies, to improve existing energy technologies, and to aid economic growth.

The GOAL of the BES program is to:

Support the highest quality research through thorough and fair peer review; operate major scientific user facilities, such as synchrotron radiation and neutron sources, for broad support of many forefront research areas; plan, design, and construct advanced facilities to meet future research needs. To accomplish the mission, BES supports basic scientific research at universities, national laboratories and industrial research laboratories (primarily through the Small Business Innovation Research program) in materials sciences, chemical sciences, engineering, geosciences, and energy biosciences.

The OBJECTIVES related to these goals are:

1. To CONTRIBUTE TO SUSTAINABLE ENERGY PRODUCTION AND USE - Conduct basic research that creates scientific and engineering knowledge in support of Department of Energy mission thrusts to accelerate the utilization and development of energy technologies in a safe and environmentally compatible manner.

2. To PROVIDE WORLD CLASS SCIENTIFIC FACILITIES - Provide and operate major user facilities needed for DOE research and foster research partnerships with industry and the entire scientific community. These scientific facilities include synchrotron radiation sources, neutron sources, and electron beam microanalytical instruments which are essential forefront research tools that scientists use to advance knowledge and develop new products, materials, and manufacturing processes.

PROGRAM MISSION - BASIC ENERGY SCIENCES (Cont'd)

3. To ENSURE THAT RESEARCH RESULTS ARE WIDELY KNOWN, VALUED AND USED - Promote open communications and the transfer of information, know-how and technology among university, government, and the private sector. Activities include peer review of all research activities and strong coordination and planning with the energy technology offices of the Department, collocation of researchers, input from all stakeholders, and in-depth workshops and conferences between scientists, engineers, and technologists with management sponsorship and participation. The national laboratories and universities are excellent resources to bring about these important interactions.

Scientific Facilities Utilization:

The Basic Energy Sciences program request includes $277,636,000 to maintain support of the Department's scientific user facilities. Approximately 20% of this amount is associated with the continuation of the science user facilities initiative contained in the FY 1996 budget request. This investment will provide research time for thousands of scientists in universities, Federal agencies, and U.S. companies. It will also leverage both Federally and privately sponsored research, consistent with the Administration's strategy for enhancing the U.S. National science investment. The proposed funding supports the number of users served in FY 1996, which was an increase of several thousand over FY 1995 levels, and will maintain the quality of service and availability of facility resources to users, including university and government scientists, as well as private companies who rely on unique facilities for their basic research needs. The proposed funding level will also provide for efficient utilization of high technology facilities, which are generally oversubscribed by factors of two to three. Research communities that will benefit from this initiative include structural biology, materials sciences, superconductor technology, and medical research and technology development.

PERFORMANCE MEASURES:

The Department has developed performance measures for the results of its basic research activities. General performance measures of program outputs for basic research include such metrics as the number of scientists supported, the number of students earning advanced degrees, the number of scientific publications in peer-reviewed journals, the number of awards from professional organizations, and the number of citations in scientific publications. Metrics for the transfer of new knowledge to a technology application include the number of cooperative agreements with industry, the number of projects resulting in support from a DOE Energy Technology program, the number of invention records and patents, and the number of industry users at the major scientific user facilities. For construction projects, metrics can include costs and schedule milestones completed against approved project baselines. These performance measures are easily tabulated, commonly used, and begin to provide a framework for evaluating program efficiency. However, the most descriptive indicators in this area are qualitative rather than quantitative measures. In order to measure outcomes, or program effectiveness, the impact of the research outputs must be assessed in terms of the quality of the new knowledge gained, its usefulness to technology development, and its longer-term benefit to society. Although there are limited and expensive methods for evaluating the quality of science through peer-review metrics, no metric exists that can accurately measure

PROGRAM MISSION - BASIC ENERGY SCIENCES (Cont'd)

science's impact on technology and society. The extent of industrial interest is a measure of the value of the research. BES has been involved in over 500 collaborations with industry. These collaborations extend over all sectors of the economy.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The existing National User Facilities will operate more effectively (in some cases with substantial increases in operating hours, and in others, with the implementation of modern state-of-the-art instrumentation which will use the neutron and photon beams more effectively) with more experiments and more users as a consequence of the President's User Facility Initiative in FY 1996. This initiative will be sustained in FY 1997 with $277,636,000 included to maintain support of the Department's Scientific User Facilities.

- Commissioning of the Advanced Photon Source Storage Ring began in FY 1995 and a circulating current of 8.5 milliamperes was achieved resulting in the first x-ray beams at this third generation x-ray source. The design of 100 milliamperes was reached in January of 1996.

- Preconstruction research and development, environmental impact statement, and conceptual design will be performed for a Spallation Neutron Source. In addition, options will be evaluated for upgrading existing reactor and spallation sources as near-term solutions for providing neutrons while the next generation Spallation Neutron Source is being developed.

- Construction of the Combustion Research Facility, Phase II will continue in FY 1996 and FY 1997 with completion scheduled for FY 1999.

- The program assumes responsibility for the management of the Experimental Program to Stimulate Research (EPSCoR) in FY 1996.

MATERIALS SCIENCES
(Tabular dollars in thousands, Narrative in whole dollars)

I. **Mission Supporting Goals and Objectives:**

The Materials Sciences subprogram supports energy related fundamental scientific research in materials and the operation of national scientific user facilities that support the energy mission needs and Strategic Plan of the Department. The facility operations activities funded in this subprogram are described in a separate "Major User Facility" section of this budget. Facilities supported include the National Synchrotron Light Source (NSLS), the High Flux Beam Reactor (HFBR), the Intense Pulsed Neutron Source (IPNS), the Stanford Synchrotron Radiation Laboratory (SSRL), the Manuel Lujan, Jr. Neutron Scattering Center (MLJNSC), the Advanced Light Source (ALS), and the Advanced Photon Source (APS).

Materials Science is an enabling technology. The efficiency, economics, environmental acceptability, and safety of all energy generation, conversion, transmission, and conservation technologies are limited by the performance of materials. Research in Materials Sciences is concerned with the discovery and optimization of the behavior and performance of materials in these energy technologies. This research seeks to understand the synergistic relationship among the synthesis, processing, structure, properties, behavior, and performance of materials in such energy technologies.

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Materials Sciences Research	$129,773	$162,669	$161,480	$- 1,189	- 0.7%
Facilities Operations	133,825	174,436	173,080	- 1,356	- 0.8%
Total, Materials Sciences	$263,598	$337,105	$334,560	$- 2,545	- 0.8%

III. **Performance Summary: MATERIALS SCIENCES (Cont'd)**

FY 1995 Accomplishments:

- Synthesis and processing research on advanced materials such as the design of advanced chemical vapor deposition reactors for the fabrication of semiconductors has led to materials with enhanced behavior and performance and reductions in the waste, pollution, and cost associated with the production of new and modified materials.

- Improved scientific understanding of corrosion mechanisms, achieved partly through experimental techniques such as optically pumped nuclear magnetic resonance of surfaces, x-ray characterization of corroding surfaces, and direct atom imaging and verification of surface diffusion could lead to economic savings as well as improved performance in energy technologies. Aqueous, galvanic, and gaseous corrosion damage costs the U.S. economy 5% of the Gross Domestic Product per year.

- Fundamental research on energy losses in high-performance magnets will lead to improved efficiency motors and transformers. Magnetic energy losses in motors and transformers cost the U.S. economy $16 million per year.

- A basic understanding of the welding and joining of metals and ceramics has led to improved welding procedures for dissimilar metals and for the joining of metals to ceramics. Significantly improved welds reduce catastrophic failures and increase lifetime of components in energy power plants.

- Improved understanding of the high-rate and superplastic forming of metals and alloys has been gained through fundamental theory and computer simulation of the process. Better understanding of interfacial deformation mechanisms during high-rate metal forming led to the successful fabrication of lightweight alloys for components, such as a door panel produced by a domestic automobile manufacturer.

- Improved understanding of neutron-induced irradiation damage has led to more accurate predictive modelling and failure prevention in on-line commercial nuclear power plants.

- New analytic methods involving synchrotron irradiation have led to more sensitive analyses for catalysts and trace impurities in surfaces and interfaces.

III. **Performance Summary: MATERIALS SCIENCES (Cont'd)**

- Neutron scattering experiments have provided an understanding of magnetic structure and excitations, hydrocarbons, residual stress mapping and atomic arrangements in a broad range of materials (polymer blends, metals, alloys, and ceramics).

- Basic research on the properties and behavior of high-temperature load bearing, structural ceramics, and ceramic matrix composites has made these advanced materials move closer towards acceptance in large-scale applications for high-speed cutting tools and fuel efficient and low pollutant engines and turbines.

- Basic research on sound wave scattering by microscopic flaws in solid materials has led to improved nondestructive diagnostics and early warning of impending failure.

- Understanding of the effects of defects produced by processing of ceramics and polymers has led to significantly improved performance for ceramic and polymer electrolytes for batteries and fuel cells.

- Understanding the grain boundary structure and microchemistry, phase equilibria, processing and behavior of ordered intermetallic alloys has led to increased commercial application for heat, load, wear and corrosion resistant applications.

- Basic research on the interaction of charged particle beams with solid surfaces has led to the commercialization of surface modification and ion beam implantion technologies for improved corrosion, wear resistance, and surface load bearing applications.

- New understanding in the processing of high-temperature superconductors with improved current-carrying capability has brought them closer to eventual commercialization.

- Coordinated multi-institutional and multidisciplinary basic research projects were initiated in response to workshops under the Center of Excellence for Synthesis and Processing of Advanced Materials concerning conventional and superplastic metal forming, materials joining, nanostructured materials for energy applications, microstructural engineering with polymers, tailored microstructures in hard magnets, processing for surface hardness, and mechanically reliable surface oxides for high temperature corrosion resistance. The Center of Excellence for Synthesis and Processing is coordinated by Sandia National Laboratories and involves work at 13 national laboratories.

- Funding in the amount of $5,433,000 and $272,000 has been transferred to the SBIR and STTR programs, respectively.

III. **Performance Summary: MATERIALS SCIENCES (Cont'd)**

FY 1996 Planned Accomplishments (to date and planned):

- Basic scientific investigations will be continued in all of the topics that correspond to the above FY 1995 Accomplishments and in all of the seven projects initiated in FY 1995 under the Center of Excellence for the Synthesis and Processing of Advanced Materials.

- Coordinated multi-institutional and multidisciplinary new projects that will be initiated in response to workshops under the Center of Excellence for the Synthesis and Processing of Advanced Materials concerning high efficiency photovoltaics and bulk metallic glasses.

- Research will be initiated concerning photonic band gap materials that may lead to improved signal transmission and processing using light instead of electrons.

- Research to study the role of defects in advanced permanent magnet materials with a goal of enhancing the magnetic strength will be initiated that could lead to significant reductions in the energy losses and cost of operation of motors.

- Initiate research using new techniques to study the nanometer-scale magnetic structure-property relationships in materials surfaces, thin films, and multilayers that will lead to an improved understanding of new phenomena such as "giant magnetoresistance" and "spin valve" effects which have the potential to enhance existing electronics technologies.

- Peer-reviewed basic materials research will be initiated that fulfills the needs and opportunities that were identified in the joint Basic Energy Sciences-National Science Foundation Vehicles for the Future workshop that was held in January 1995.

- Peer-reviewed basic materials research will be initiated that will be responsive to needs and opportunities relating to total product lifecycle and recyclability.

- Peer-reviewed basic materials research will be initiated that will be responsive to needs and opportunities relating to the minimization, safe transport, and containment of waste and hazardous materials.

- Preconstruction research and development, environmental impact statement, and Conceptual Design will be initiated for a Spallation Neutron Source. In addition, options will be evaluated for upgrading existing reactor and spallation sources as near-term solutions for providing neutrons while the next generation Spallation Neutron Source is being developed.

III. **Performance Summary**: **MATERIALS SCIENCES** (Cont'd)

- Experiments involving very high resolution, analytical, and high voltage environmental cell electron beam microcharacterization will be carried out at the Electron Microscopy Center for Materials Research, Center for Microanalysis of Materials, National Center for Electron Microscopy and Shared Research Equipment Program.

- Funding in the amount of $6,599,000 and $494,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- Basic scientific investigations will be continued in all of the topics that are planned for FY 1996 with slight reductions in the areas of Solid State Physics, Materials Chemistry, Metallurgy and Ceramics..

- Initiate research concerning the surface and interface properties and behavior of quasicrystals for materials with improved corrosion resistance.

- Initiate research concerning charge transport across superconductor-semiconductor and superconductor-metal interfaces to develop understanding on joining of superconductors with normal materials.

- Initiate research concerning the kinetics of phase transformations in the heat affected zones of welds to improve understanding of failure in welds.

- Initiate research concerning the synthesis of non-equilibrium materials using laser-molecular beam epitaxy to synthesize new materials with improved properties.

- Peer-reviewed basic materials research that fulfills the needs and opportunities that were identified in the joint Basic Energy Sciences-National Science Foundation "Basic Research Needs for Environmentally Responsive Technologies of the Future" Workshop that was held in January 1996 will be continued.

- Peer-reviewed basic materials research that is responsive to needs and opportunities relating to total product lifecycle will be continued.

III. **Performance Summary: MATERIALS SCIENCES** (Cont'd)

- Peer-reviewed basic materials research that is responsive to needs and opportunities relating to the minimization, safe transport, and containment of waste and hazardous materials will be continued.

- Conceptual Design, environmental impact statement, and preconstruction research and development for the Spallation Neutron Source will be continued. In addition, options will be evaluated for upgrading existing reactor and spallation sources as near-term solutions for providing neutrons while the next generation Spallation Neutron Source is being developed.

- Funding in the amount of $8,364,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

Reduced funding levels will cause slight decreases in research in the areas of solid state physics, materials chemistry, metallurgy, and ceramics will be decreased ($-1,189,000).

Overall operating time at user facilities such as HFBR, IPNS, NSLS, SSRL, LANSCE, and ALS will be maintained at slightly below the FY 1996 level ($-1,356,000). Operation of the Advanced Photon Source is initiated.

884

CHEMICAL SCIENCES
(Tabular dollars in thousands, Narrative in whole dollars)

I. **Mission Supporting Goals and Objectives:**

The Chemical Sciences subprogram activity supports a broad range of basic research in molecular, atomic and chemical engineering sciences necessary for both improvements in existing energy technologies and that provides the necessary underlying science base that may lead toward the development of new energy technologies. The program is focussed upon the creation of new knowledge that will impact a broad spectrum of energy technologies. Major chemical sciences research efforts are important to the more efficient conversion of solar energy as well as improved catalytic processing to produce fuels, electricity or chemicals; more efficient and cleaner combustion; better utilization of the nation's carbon-containing resources including natural gas, oil, and coal; improved approaches to environmental concerns related to energy production; more sensitive and specific monitoring of physical and chemical processes; and the advancement of fusion and plasma related sciences.

In addition, the Chemical Sciences program provides support for major scientific user facilities which are operated for the benefit of the entire scientific community. The facility operations funded in this subprogram are described in a separate "Major User Facility" section in this budget. Facilities supported include: the National Synchrotron Light Source (NSLS), the High Flux Isotope Reactor (HFIR), the Radiochemical Engineering Development Center (REDC), the Stanford Synchrotron Radiation Laboratory (SSRL), and the Combustion Research Facility (CRF).

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Chemical Sciences Research	$100,629	$114,972	$112,105	$- 2,867	- 2.5%
Facilities Operations	53,817	62,071	61,265	- 806	- 1.3%
Total, Chemical Sciences	$154,446	$177,043	$173,370	$- 3,673	- 2.1%

III. **Performance Summary: CHEMICAL SCIENCES** (Cont'd)

FY 1995 Accomplishments:

- A better understanding of the thermal transformations of hydrocarbons is key to developing improved coal combustion and coal conversion technologies. A new semiempirical approach has been devised that quantitatively predicts needed thermochemical data for the important species involved in these thermal conversions.

- Basic studies have led to the identification of a new catalyst that can remove undesirable nitrogen oxides components from automobile exhaust as the auto is operated under highly fuel efficient conditions (lean-burn). Studies have shown that certain metal oxide-based catalysts, are active for the removal of the nitrogen oxides. Here, as in other research, the elucidation of the mechanism through identification of the reactive intermediates played a critical role.

- Fundamental investigations of catalytic metal surfaces in the presence of carbon led to the realization that new carbide structures would be formed on iron surfaces at elevated temperatures in the presence of carbon-containing compounds. This led to the spin off discovery of a new high-temperature iron surface coating that has superior lubrication properties.

- Laser pulses are used to study dynamical processes at ever shorter times. Basic combustion studies of the very short times required for a molecule to redistribute its energy or to fall apart at high temperatures led to a device which is now a commercial product to better characterize short laser pulses.

- The lack of general principles governing the relationship between catalytic activity and the physical, chemical, and electronic structure of the catalyst has impeded catalyst design for many energy intensive industrial applications. Recent catalysis basic research results have removed some of this impediment by showing how surface shape and structure have a major effect on catalytic activity.

- New atomic physics experimental results on neutralization of ions through collisions with surfaces have improved our understanding of industrial plasma processes used for semiconductor electronics, materials strengthening and fusion technology.

- A technique developed to study combustion has been found to be broadly useful in experiments supported through other Federal programs. The method, photofragment imaging, has been used to identify a new path for the generation of ozone in the upper atmosphere. This result will help explain why current models underestimate the amount of ozone in the upper atmosphere.

III. **Performance Summary: CHEMICAL SCIENCES** (Cont'd)

- o A successful model of coal swelling in solvents is a significant advance that will permit improved coal conversion possibilities through better understanding of the structure-reactivity and chemical bonding relationships in coal.

- o Initiated realignment of a national laboratory radiation chemistry program into research critical to a better understanding of environmental issues associated with the remediation of tank wastes.

- o A biomimetic system for photosynthesis has been developed that successfully mimics all of the properties of the natural photosynthetic protein. The system undergoes the necessary photochemical transformations with an efficiency that rivals the natural system and represents an important advance in the conceptual development needed for the conversion of solar energy into other energy forms.

- o Funding in the amount of $3,169,000 and $158,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- o Collaborative combustion related research critical to improved energy efficiency with reduced pollution in internal combustion engines and stationary combustors will be enhanced.

- o Research utilizing the major scientific user facilities will be enhanced in high priority research areas including combustion reaction dynamics, the characterization of environmental samples, materials precursors and plasma science for advanced processing.

- o Better integration of research in separations science, actinide chemistry, analytical chemistry and radiation chemistry will be carried out with those aspects closely related to environmental management programs and issues.

- o Separations research in support of analytical determinations and improved separation technology aimed at solving environmental problems will be emphasized.

- o Research on systems that mimic natural photosynthesis and offer a real opportunity for conversion of solar energy into other useful energy forms with minimal insult to the environment will be enhanced.

887

III. **Performance Summary: CHEMICAL SCIENCES** (Cont'd)

- New knowledge, both theoretical and experimental, of high and low temperature plasmas will be developed. These efforts will achieve a better physical and chemical understanding of the plasma so that technologies dependent upon such information will be improved.

- Catalytic properties of roughened surfaces will be investigated to understand how the morphology of the roughened surface affects the selectivity of isomerization/hydrogenation reactions important to energy conversion and in nitric oxide decomposition reactions important to reducing emissions of environment pollutants associated with energy utilization.

- Research will lead to new battery electrodes that will be transferred to the commercial sector for performance and scale up evaluation.

- Funding in the amount of $3,458,000 and $259,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- Research utilizing the major scientific user facilities will continue to be enhanced in high priority research areas including combustion reaction dynamics, the characterization of environmental samples, materials precursors and plasma science for advanced processing.

- Interfacial chemistry research that emphasizes understanding of surface properties at the molecular level will provide new understanding of and improved catalytic and separations technologies.

- Studies of the fundamental molecular properties of gases, liquids and solids will be carried out to aid development of molecularly selective separation processes.

- Theoretical advancements to resolve critical parameters in battery design and composition will be incorporated into new devices for evaluation of performance criteria.

- Technical advances, building upon those from preceding years, will continue toward possible artificial high-efficiency photosynthetic devices that directly convert solar energy into chemical energy.

III. **Performance Summary: CHEMICAL SCIENCES** (Cont'd)

- Laser-based diagnostics will be used to examine chemical processes involved in combustion. The systems to be examined will be isolated so as to gain fundamental understanding of the dynamics of the system which will be applied to actual combustion processes.
- Synchrotron based atomic physics research will be applied to the study of atomic and plasma systems that will permit further advances in commercial plasma processes and fusion energy concepts.
- Research in organic coal chemistry and analytical and radiation chemistry will be decreased.
- Funding in the amount of $4,334,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

Research in the areas of organic coal chemistry as well as analytical and radiation chemistry will be reduced ($-2,867,000).

Overall operating time at user facilities such as NSLS, HFIR, CRF, REDC, and SSRL will be maintained at slightly below the FY 1996 level ($-806,000).

688

ENGINEERING AND GEOSCIENCES
(Tabular dollars in thousands, Narrative in whole dollars)

I. **Mission Supporting Goals and Objectives:**

This program conducts research in two disciplinary areas, Engineering and Geosciences, to support existing energy technologies and strengthen the foundation for future energy technologies. Ultimate research objectives include pollution avoidance, control, and remediation; increased energy efficiency; and assuring the underlying knowledge for the availability and responsible use of future energy supplies. The Engineering Research program serves as an effective conduit between basic science and applications-oriented research and development with the goals of maintaining technical leadership and stimulating job growth. Geosciences Research provides the foundation for environmentally sound, efficient, and economic use of the Earth's energy resources and provides a scientific foundation for innovative and efficient site characterization and remediation technologies. The Engineering and Geosciences research programs are implemented using individual investigator initiated research proposals subjected to merit (peer) review procedures.

II. **Funding Schedule**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Engineering Research	$ 15,865	$ 17,924	$ 17,550	$- 374	- 2.1%
Geosciences Research	18,770	20,887	23,700	+ 2,813	+ 13.5%
Total, Engineering and Geosciences	$ 34,635	$ 38,811	$ 41,250	$+ 2,439	+ 6.3%

III. **Performance Summary: ENGINEERING AND GEOSCIENCES (Cont'd)**

FY 1995 Accomplishments:

Produced more than 300 publications in the peer-reviewed scientific literature dealing with research accomplishments in Engineering and Geosciences.

Engineering

- Continued support for 36 three-year predoctoral fellowships addressing energy-related problems in integrated manufacturing.
- Developed new insight into processes in flows of gas and liquids which has provided a better understanding of the onset of pulsating and irregular flow which causes damage in oil and gas pipelines.
- Conducted theoretical and experimental studies which enable realistic models for prediction of the behavior of nonlinear systems with memory (i.e. hysteresis) occurring in most engineering systems and application (electrical motors/generators, chemical process plants, automobile tires, etc.).
- Advanced the scientific basis for design and construction of autonomous intelligent systems (smart instruments, smart robots, smart sensors) for use in energy-related hostile environments (e.g. radioactive and mixed waste sites).
- Performed studies on the effects of periodic and random temperature and stress changes on the reliability and longevity of energy structures.
- Funding in the amount of $325,000 and $16,000 has been transferred to the SBIR and STTR programs, respectively.

Geosciences

- Developed new ways to observe small scale pore structure in rocks using laser scanning confocal microscopy and synchrotron-based high-resolution computed microtomography to improve foundation for predicting fluid (gas, oil, geothermal, ground water) flow and interaction in porous and fractured rocks.

III. **Performance Summary: ENGINEERING AND GEOSCIENCES** (Cont'd)

- Applied poroelasticity theory to observational data from a producing natural gas field to show the cause of microearthquakes and subsidence was volumetric contraction and very small (30MPa) stress changes associated with production.

- Proposed an approach which can place an upper limit on the fractal scale dependence of mechanical and fluid transport properties of single fractures.

- Collected and interpreted elemental, isotopic, and molecular data from natural samples to show that active migration of oil and gas to shallow reservoirs can take place rapidly (few years) showing that evaluation as a dynamic and replenishing system is essential.

- Demonstrated that it is possible to use stable isotope information to trace multiple high-temperature geologic events in some zircons even in the presence of radiation damage.

- Funding in the amount of $383,000 and $19,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

Engineering

- The first cohort (12) of National Academy of Engineering Department of Energy predoctoral fellows in energy-related integrated manufacturing will graduate.

- Fundamental work on the behavior of dense suspensions and slurries will continue.

- Nonlinear theories in mechanics will enhance the scientific basis for nonimaging optical systems, such as area illumination systems, energy efficient flat display screens for portable computers, etc.

- The feasibility of chemical sensors using in vitro samples of nerve tissue integrated with conventional electronics will be studied.

III. **Performance Summary: ENGINEERING AND GEOSCIENCES** (Cont'd)

- Research at the interface between chemical engineering and biology will continue to strengthen by providing the scientific basis for improving the practicality and economic viability of biological processes in energy-related applications.

- Funding in the amount of $350,000 and $26,000 has been budgeted for the SBIR and STTR programs, respectively.

Geosciences

- Initiate experiments on the GeoCARS beamline at the Advanced Photon Source (ANL) for space- and time-resolved spectroscopy providing unique information on mineral-fluid reactions important in energy and environmental applications.

- Develop new methods of modeling and processing seismic data through collaborative basic research involving DOE Laboratory, University, and Industry researchers to obtain improved high-resolution, 3-D images of subsurface structure and properties.

- Obtain and interpret detailed images of subsurface electrical conductivity to assess role and magnitude of fluid flow in large-scale faulting and formation of fluid-filled reservoirs.

- Continue research using partitioning of naturally occurring isotopes as tracers for mineral-fluid and gas-liquid reactions at spatial scales ranging from intragranular to sub-continental, as related to the origin, distribution, and recovery of energy resources.

- Continue research on the role of sulfur/sulfonates, thermolytic decomposition of organic matter, and reactions between organic and inorganic rock constituents important in the origin, migration, and entrapment of oil, gas, geothermal fluids, and contaminated ground water.

- Funding in the amount of $410,000 and $31,000 has been budgeted for the SBIR and STTR programs, respectively.

III. **Performance Summary: ENGINEERING AND GEOSCIENCES (Cont'd)**

FY 1997 Planned Accomplishments:

Engineering

- Second group of 12 National Academy of Engineering Department of Energy predoctoral fellowships will graduate and documentation of program effectiveness will be compiled.
- Continue research at the forefront of the mechanical sciences with particular emphasis on the formation and dynamics of foams and the rheological behavior of suspensions and slurries.
- Strengthen foundation for application of the theory of non-linear systems to improve the application to complex natural phenomena.
- Continue research at a reduced level on interacting autonomous systems and reconfigurable systems which can readily adapt to changing tasks and environments.
- Continue to strengthen research at the interface between biology and chemical process control to improve the practicality and viability of using biological processes in energy and environmental applications.
- Research in engineering data and analysis will continue to provide critical thermodynamic data important for industrial processes and environmental cleanups, such as needed for separation of aqueous-hydrocarbon mixtures.
- Funding in the amount of $439,000 has been budgeted for the SBIR program.

Geosciences

- Extend research in theoretical and computational modeling of atomistic-level reactions taking place at mineral-fluid surfaces using first principles methods and taking advantage of new data obtained at the Advanced Photon Source.
- Refine high-resolution electromagnetic and seismic geophysical techniques for characterization of geologic structure and heterogeneity in fluid-bearing reservoirs of the Earth's upper crust using surface, surface to hole, and cross-hole met

894

III. **Performance Summary: ENGINEERING AND GEOSCIENCES** (Cont'd)

- o Continue to develop integrated approach for analysis and interpretation of fracture-controlled fluid flow using advanced geophysical and rock mechanics methods with broad-based application to energy resource use issues.
- o Increase research on geochemistry, geophysics, and geohydrology of fluid flow and in sedimentary basins using integrated experimental, theoretical, and observational techniques.
- o Maintain research on fundamental physical, thermodynamic, and transport properties of rocks, minerals, geologic fluids and their synthetic analogues.
- o Funding in the amount of $593,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

Funding will be reduced in the areas of intelligent control systems ($-374,000).

Funding will be increased for basic research on fluid transport in, and geophysical imaging of, oil and gas reservoirs ($+2,813,000).

ENERGY BIOSCIENCES
(Tabular dollars in thousands, Narrative in whole dollars)

I. **Mission Supporting Goals and Objectives:**

The Energy Biosciences subprogram supports research to provide a basic understanding of the biological phenomena associated with the capture, transformation, storage and utilization of energy. The research on plant and non-medical microorganisms focuses on a range of biological processes including photosynthesis, bioenergetics, primary and secondary metabolism, the synthesis and degradation of biopolymers such as lignin and cellulose, anaerobic fermentations, genetic regulation of growth and development, thermophily and other phenomena associated with metabolism under harsh conditions. The research supported is fundamental and is selected to broadly support Department of Energy's goals and objectives.

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Energy Biosciences	$ 26,935	$ 28,700	$ 28,185	$- 515	- 1.8%
Total, Energy Biosciences	$ 26,935	$ 28,700	$ 28,185	$- 515	- 1.8%

968

III. **Performance Summary:**

FY 1995 Accomplishments:

- Developed mutational strategies to study the synthesis of plant cell wall complex carbohydrates, the most abundant biopolymer.
- First isolation of a gene that confers plant resistance to a bacterial disease provided new insights into the "immune" system of plants.

III. **Performance Summary: ENERGY BIOSCIENCES** (Cont'd)

- Significant progress was made in elucidating the macromolecular structure, organization and catalytic mechanisms of the cellulose degrading complex from bacteria.
- The biosynthetic pathway of an unusual fatty acid (petroselinic acid) was determined in oil seeds. Petroselinic acid has important chemical feedstock uses.
- Demonstrated that individual enzymes from bacteria capable of living in the cold (psychrophilic bacteria) are active at significantly lower temperatures than their counterparts from temperate organisms.
- Cover of recent Science magazine highlights "Emerging Plant Science." Of the five feature articles, three acknowledge Energy Bioscience support.
- Funding in the amount of $549,000 and $28,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- Enhance research activities examining the metabolism and physiology of extremely thermophilic (high temperature loving) bacteria.
- Studies on the metabolic capacities of plants to synthesize hydrocarbons and carbohydrates will be emphasized.
- Continue to support graduate research training in specific sub-areas that will offer numerous future scientific and career opportunities.
- Encourage new approaches to study the development and function of plant roots critical for the use of suboptimal/contaminated soils for bioresource production.
- Biophysical and structural analyses of photosynthetic apparatus in plants and bacteria will continue to focus on establishing the precise molecular mechanisms involved.
- Initiate studies on the role of membranes in bioenergetic conversions and transport.
- Funding in the amount of $562,000 and $42,000 has been budgeted for the SBIR and STTR programs, respectively.

III. **Performance Summary: ENERGY BIOSCIENCES (Cont'd)**

FY 1997 Planned Accomplishments:

- Initiate genomic analysis of critical sections of the genetic material from the model plant, *Arabidopsis*.
- Reduce activities focusing on describing molecular genetic regulatory strategies in plants and on the mechanisms involved in plant/pathogen interactions.
- Microbial physiological studies will be augmented in order to continue to develop this underpopulated area and to take advantage of a number of new scientific opportunities.
- Integrate knowledge of biochemical pathways to determine mechanisms regulating the overall flux of fixed carbon.
- Initiate activities to determine the role of intracellular localization/compartmentalization on metabolic processes.
- Funding in the amount of $705,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

Research on the mechanisms involved in plant/pathogen interactions will be reduced along with studies aimed at describing molecular genetic regulatory strategies in plants ($-515,000).

BASIC ENERGY SCIENCES

RELATED CAPITAL FUNDING
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Related Capital Funding subprogram funds General Plant Projects (GPP), Accelerator and Reactor Improvements (AIP), and Capital Equipment in support of the BES research program.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
General Plant Projects (GPP)	$ 11,412	$ 6,415	$ 9,275	$+ 2,860	+ 44.6%
Accelerator and Reactor Improvements (AIP)	7,449	7,500	9,840	+ 2,340	+ 31.2%
Capital Equipment	39,873	49,016	45,695	- 3,321	- 6.8%
Total, Related Capital Funding	$ 58,734	$ 62,931	$ 64,810	$+ 1,879	+ 3.0%

III. Performance Summary:

FY 1995 Accomplishments:

- Funding was provided for equipment in support of areas of high priority in the research programs, general purpose equipment requirements, and areas which required ES&H attention.

- GPP funding was provided for minor new construction, other capital alterations and additions, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

III. **Performance Summary: RELATED CAPITAL FUNDING (Cont'd)**

- o AIP funding supported additions and modifications to accelerator and reactor facilities which are supported by the BES research program.

FY 1996 Accomplishments (to date and planned):

- o Funding will be provided for equipment in support of areas of high priority in the research program, general purpose equipment requirements, and areas which required ES&H attention. Increased funding in support of the Advanced Photon Source and the User Facility Initiative.

- o GPP funding will be provided for minor new construction, other capital alterations and additions, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- o AIP funding will support additions and modifications to accelerator and reactor facilities which are supported by the BES research program. The total estimated cost of each project will not exceed $2,000,000.

FY 1997 Planned Accomplishments:

- o Funding will be provided for equipment in support of areas of high priority in the research programs, general purpose equipment requirements, and areas which require ES&H attention. Decrease reflects reduced requirements in support of the Advanced Photon Source.

- o GPP funding will be increased for minor new construction, other capital alterations and additions, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- o AIP funding will support additions and modifications to accelerator and reactor facilities which are supported by the BES research program.

III. **Performance Summary: RELATED CAPITAL FUNDING (Cont'd)**

Explanation of Funding Changes FY 1996 to FY 1997:

The reduction in capital equipment funding is due to decreased ($-4,666,000) funding necessary to support the Advanced Photon Source and an increase ($+1,345,000) in GPE for ORNL ($-3,321,000).

GPP funding will be increased to support landlord responsibilities at Oak Ridge National Laboratory ($+2,860,000).

The increase in AIP funding is due to the completion of one project over the $2,000,000 threshold at LBNL in FY 1996. These funds are now included in the under $2,000,000 category ($+2,340,000).

CONSTRUCTION
(Tabular dollars in thousands, Narrative in whole dollars)

I. **Mission Supporting Goals and Objectives:**

Construction is needed to support the research in each of the subprograms in the Basic Energy Sciences program. Experiments necessary in support of basic research require that state-of-the-art facilities be built or existing facilities modified to meet unique research requirements. Reactors, radiation sources, and neutron sources are among the expensive, but necessary, facilities required. The budget for the BES program includes funding for the construction and modification of these facilities.

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Construction	$ 58,379	$ 9,986	$ 11,500	$+ 1,514	+ 15.2%
Total, Construction	$ 58,379	$ 9,986	$ 11,500	$+ 1,514	+ 15.2%

III. **Performance Summary:**

FY 1995 Accomplishments:

- Provided necessary funds to continue construction of the Advanced Photon Source at the approved schedule.

FY 1996 Accomplishments (to date and planned):

- Complete funding of the Advanced Photon Source consistent with the approved schedule.
- Provided the continued funding to complete (in 4 years) the Combustion Research Facility, Phase II.
- Funding for Accelerator and Reactor Improvements and Modifications in excess of $2,000,000 is provided for a liquid hydrogen cold source at the High Flux Isotope Reactor (HFIR) and an insertion device at the Advanced Light Source (ALS).

III. **Performance Summary: CONSTRUCTION (Cont'd)**

FY 1997 Planned Accomplishments:

- Continue construction of the Combustion Research Facility, Phase II at the approved schedule.
- Continue funding for construction of the Accelerator and Reactor Improvement (AIP) liquid hydrogen cold source project at the High Flux Isotope Reactor (HFIR).

Explanation of Funding Changes FY 1996 to FY 1997:

- The increase ($+1,514,000) is the net result of: completion of the Advanced Photon Source ($-3,186,000); the scheduled increase in the construction of the Combustion Research Facility, Phase II ($+7,000,000); and completion of the AIP project at LBNL ($-2,300,000).

MAJOR USER FACILITIES
(Tabular dollars in thousands, Narrative in whole dollars)

I. **Mission Supporting Goals and Objectives:**

The goal of the National User Facilities is to provide experimental capabilities which cannot otherwise be achieved in individual laboratories. These facilities are constructed and operated to support energy-related research, but are available to all qualified scientists based on the merit of their proposed experiments.

There were about 4,500 users in FY 1995 of Basic Energy Sciences-funded national user facilities. They conducted forefront research in materials, chemical, earth, biological, health, medical and other sciences. The costs for the construction and the environmentally acceptable and safe outside user-friendly operation of these world class facilities are substantially beyond the capability of the academic and private industrial sectors. The facilities are made available to all qualified users from the academic and private industrial sectors, and both DOE and non-DOE government laboratories. They thus permit the Nation's science and technology enterprise to have access to research instruments that are required for world-competitive cutting edge forefront research that would not otherwise be possible. All of the Basic Energy Sciences national user facilities have been constructed within cost, on schedule, and with rigorous compliance to all environmental, safety, and health regulations.

II. **Funding Schedule: MAJOR USER FACILITIES** (Cont'd)

Funding for these facilities is provided in the Materials Sciences and Chemical Sciences subprograms.

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
National Synchrotron Light Source	$ 23,491	$ 26,599	$ 26,915	$+ 316	+ 1.2%
High Flux Beam Reactor	21,100	23,732	24,060	+ 328	+ 1.4%
Intense Pulsed Neutron Source	6,800	10,867	10,970	+ 103	+ 0.9%
High Flux Isotope Reactor	24,248	26,925	27,165	+ 240	+ 0.9%
Radiochemical Engineering Development Center	7,070	7,234	7,310	+ 76	+ 1.0%
Stanford Synchrotron Radiation Laboratory	13,487	17,658	17,795	+ 137	+ 0.8%
Manuel Lujan, Jr. Neutron Scattering Center	0	6,688	6,740	+ 52	+ 0.8%
Combustion Research Facility	4,171	4,402	4,445	+ 43	+ 1.0%
Advanced Light Source	21,200	28,616	28,945	+ 329	+ 1.1%
Advanced Photon Source	64,771	78,671	80,000	+ 1,329	+ 1.7%
Undesignated	1,304	5,115	0	- 5,115	-100.0%
Total, Major User Facilities	$ 187,642	$ 236,507	$ 234,345	$- 2,162	- 0.9%

FY 1995 Accomplishments:

- Thousands of experiments have been carried out on the various unique synchrotron beam lines that are dedicated to myriad experiments of importance to many disciplines at the National Synchrotron Light Source, Stanford Synchrotron Radiation Laboratory and the Advanced Light Source. They have provided progress in the understanding of catalysis and surface reactions, chemical bond characterization, the atomic structure of materials, trace chemical analysis as well as the structure of highly charged atomic ions.

- Commissioning of the Advanced Photon Source Storage Ring has begun and a circulating current of 8.5 milliamperes was achieved resulting in the first x-ray beams at this third generation x-ray source. The design current is 100 milliamperes.

III. **Performance Summary: MAJOR USER FACILITIES** (Cont'd)

- Experiments for the characterization of residual stress in manufactured parts, crystalline structure and excitation of solids such as high temperature superconductors, magnetic materials, neutron radiation damage, materials important in structural biology and hydrogen containing materials such as polymers, were carried out at the High Flux Beam Reactor and the High Flux Isotope Reactor.

- Several new beamlines, insertion devices and specialized end stations are being developed for implementation at the Advanced Light Source and the Advanced Photon Source.

- The narrow-gap undulator concept was successfully tested at the National Synchrotron Light Source, which will enhance the energy range which can be provided to users at NSLS.

- Tests of a prototype commercial gas burner at the Combustion Research Facility has led to improved design of a low NO_x emission burner.

FY 1996 Accomplishments (to date and planned):

- The existing National User Facilities will operate more effectively (in some cases with substantial increases in operating hours, and in others, with the implementation of modern state-of-the-art instrumentation which will use the neutron and photon beams more effectively) with more experiments and more users as a consequence of the President's User Facility Initiative.

- Thousands of experiments will be carried out on the various unique synchrotron beam lines that are dedicated to myriad experiments at the National Synchrotron Light Source, Stanford Synchrotron Radiation Laboratory and the Advanced Light Source. The first experiments will be carried out on the Advanced Photon Source.

- Experiments for the characterization of residual stress, magnetic structure and excitations, neutron irradiation damage and hydrogen containing materials will be carried out at the High Flux Beam Reactor and the High Flux Isotope Reactor.

- Additional beamlines will be implemented at the Advanced Light Source and the Advanced Photon Source. Instrumentation at NSLS, SSRL, IPNS, HFBR and HFIR will be upgraded. LANSCE will resume operations.

III. **Performance Summary: MAJOR USER FACILITIES (Cont'd)**

FY 1997 Planned Accomplishments:

- The National User Facilities will continue to operate much more effectively with more experiments and more users as a consequence of the President's User Facility Initiative which will be sustained in FY 1997.
- Beamlines at the National Synchrotron Light Source and the Stanford Synchrotron Radiation Laboratory will be upgraded with modern state-of-the-art instrumentation to make more effective use of these unique x-ray sources.
- Operation of the Advanced Photon Source will be initiated.
- New beamlines will be built at the Advanced Light Source and the Advanced Photon Source in FY 1997 including insertion devices to produce circularly polarized x-ray beams.
- Advanced experiments for the characterization of residual stress, magnetic structure and excitations, neutron irradiation damage and hydrogen containing materials will be carried out at the High Flux Beam Reactor and the High Flux Isotope Reactor.

Explanation of Funding Changes FY 1996 to FY 1997:

- Overall operating time at user facilities will be maintained at slightly below the FY 1996 level ($-2,162,000).

1.	Title and Location of Project: Accelerator and Reactor Improvements and Modifications, various locations	2a.	Project No. 97-E-305
		2b.	Construction Funded

8. Project Description, Justification and Scope

This project provides for additions and modifications to accelerator and reactor facilities, which are supported by the Basic Energy Sciences program. Since program priorities and needs change, the projects described below indicate the most likely projects to be funded.

The following are the projected items of work to be performed at the various locations. Since needs and priorities may change, other projects may be substituted for the examples listed below, and some of these may be located on non-Government owned property.

a. High Flux Isotope Reactor (ORNL)..... $ 2,500

Install a liquid hydrogen cold source in an existing beam port at the High Flux Isotope Reactor (HFIR). The cold source will provide a cold neutron brightness as good or better than that of the Institute Laue Langevin, the world's premier cold neutron facility. The proposed HFIR facility will provide the United States with unsurpassed capabilities in this rapidly expanding area of neutron sciences. The estimated cost to design, construct and install the cold source is $5,000,000, $2,500,000 in FY 1996 and $2,500,000 in FY 1997.

9. Details of Cost Estimate

a. Engineering, design, and inspection and component assembly and installation.....	$ 2,500
Total line item cost.....	$ 2,500

10. Method of Performance

Design, engineering and inspection will be performed by Oak Ridge National Laboratory. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding.

1.	Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. 2b.	Project No. 96-E-300 Construction Funded

8. Project Description, Justification and Scope

Phase II of the Combustion Research Facility (CRF) will add approximately 32,300 gross square feet to the existing 51,100 square-foot multibuilding CRF facility (Project No. 78-13-B, TEC $9.4 million) at Sandia National Laboratories, Livermore (SNL/L). Phase II will add 21,200 square feet to the existing 16,400 square-foot laboratory building and 11,100 square feet to the existing 25,000 square-foot office building. The project will include such site modifications and improvements as yard paving, walkways, landscaping, fencing, signage, and east entrance road relocation.

The project has been delayed due to budget constraints from FY 1989 through FY 1995. The appropriations totaling $4.8 million in FY 1987 and FY 1988 were used for site preparation and design and construction of the shell of the laboratory building addition. The appropriations in FY 1996-FY 1999 will complete the balance of the project.

The laboratory building addition will be an L-shaped extension to the south and east of the existing building. Construction of the addition will match the existing building in architectural style, materials, and finishes, color, and floor-to-floor heights. The laboratory building addition will provide sixteen new laboratory spaces and two facility laser laboratories. The new facility laser rooms will be connected to serve any Lab in the facility, via the Laser Duct and Periscope System.

Once-through conditioned ventilation will be provided from existing building fans for existing and new laboratory spaces to carry off fuel gases or vapors and products of combustion, with systems included to minimize the discharge of contaminants to the atmosphere. An electronic safety monitoring and control system will provide back-up to the ventilation system.

The existing system of ducts used for diagnostic laser beam transmission from the central laser rooms will be extended to all new laboratories. Other existing building systems such as power distribution, lighting, communications, security alarms, fire and evacuation alarms, automatic fire sprinkler, and piping and plumbing will also be extended to the addition.

The office building addition will provide space for thirty-four new offices, an open office secretarial and file area, computer terminal rooms, and conference rooms. The addition will be a two-story wing added to the north of the existing office building and will match it in architectural style, materials and finishes, color, and floor-to-floor height.

1.	Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. 2b.	Project No. 96-E-300 Construction Funded

8. Project Description, Justification and Scope (Continued)

Design of the existing mechanical building allowed space for the expansion of some services. Included in this project will be an additional chiller, pumps, and heat exchangers. Additional fan equipment providing recirculated conditioned air for the laboratory building and its addition will be in the loft space above the laboratory buildings. An additional electrical substation and process-cooling water system will also be provided.

Existing site utilities such as domestic and fire protection water, sanitary sewer, natural gas, site lighting, and electrical power and special systems will be modified and extended to service the additional facilities.

A key feature of the Combustion Research Facility is the availability of specially designed lasers for optical diagnostics. The Facility lasers developed in Phase I will continue to be used, and will be supplemented by two new Facility lasers: a high-power pulsed, high-repetition rate tunable ultraviolet laser (UV) and a subpicosecond laser. The laser beam directing system will be extended so that the existing and new laboratories have the capability of receiving the beam from any of the Facility lasers.

Other equipment includes a gas-chromatograph-mass spectrometer, infrared, visible, and ultraviolet spectrometers, elemental analyzers, optical signal processing equipment, and fast laser image processing devices.

Existing equipment from current facilities at SNL/L will be relocated to eleven of the new labs, although some of these experiments will be modified and some equipment will be upgraded. Two labs will be furnished with new equipment within the project TEC, and three labs will be furnished with new equipment by future users of the facilities.

This project will add vitally needed capacity and important new capabilities to the Combustion Research Facility at SNL, Livermore. The principal objective of this construction is to provide combustion research resources that can adequately deal with the critical needs of the 1990s and beyond. To accomplish this goal requires the addition of a new laboratory wing that emphasizes centralized next-generation laser diagnostic facilities and specially designed laboratories not available in CRF Phase I.

1.	Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. 2b.	Project No. 96-E-300 Construction Funded

8. Project Description, Justification and Scope (Continued)

The overall scope of this project is the doubling of space available for experiments. Equipment funds are required for a new central laser system and special purpose laboratory equipment. A modest enlargement of the office building is included to house the rapidly increasing population of visiting scientists. These enhancements will consolidate the combustion-related resources at a single site readily accessible to visiting scientists.

There is a continuing need for the CRF to advance combustion-related science and technology to a higher level. The improvements included in the Phase II project will address this need. For example, special lasers and equipment will be developed to provide the ability to measure quantitatively entire two- and three-dimensional images of a system's physical and chemical properties with better resolution, and far greater speed than is now possible. It is this type of advance in the science of combustion that will allow the pursuit of the increasingly more difficult and complex problems that face our country.

CRF Phase II will enable attacking many complex problems directly associated with combustion. An important example is the need for improved combustion processes that incorporate high efficiency together with minimum production of pollutants such as NO_x and air toxics. Rapid progress on these problems both in engines and in furnaces requires Phase II's next-generation diagnostic capabilities. Completion of Phase II will also enable using the tools and expertise developed in Phase I to address broader challenges facing the country. CRF basic research in laser diagnostics, for example, will underpin remote sensing applications that contribute to global-change research and to nonproliferation of weapons. Basic research in chemically reacting flows will continue to support improved U.S. competitiveness in semiconductor processing and will support the development of new industrial materials. Basic research in chemistry will address new processes, such as supercritical water oxidation, for destroying hazardous wastes with minimal environmental impact.

The implementation of Phase II will develop and make available a new class of lasers. Phase II will include a specially designed high repetition rate laser system. This laser will be optimized for laser photochemistry combustion research and for high speed planar imaging of transient combustion phenomena. A second laser system will be designed to study combustion phenomena occurring on extremely short time scales (subpicosecond time scales). The new laser systems will enable significant extension of our knowledge in a broad range of topics in fundamental combustion science.

1.	Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. 2b.	Project No. 96-E-300 Construction Funded

8. Project Description, Justification and Scope (Continued)

The normal increase in both the quantity and sophistication of combustion research by Sandia staff, together with the heightened requirements of visiting scientists, have completely saturated the facilities provided under CRF Phase I. During the past ten years the number of scientists who visit the CRF long enough to participate in research has almost tripled. In fiscal year 1993 forty professional staff hosted eighty nine such visits. Many important experiments cannot be carried out in the existing facilities because of a lack of space. Access to the unique capabilities of the CRF (such as the Facility lasers and computer resources) is essential for studying trade-offs between combustion efficiency and the pollution that results from existing and alternative fuels. However, much of the combustion research and diagnostics development work at Sandia is currently being done in facilities that are widely scattered throughout Sandia/CA where the researchers do not have access to these unique capabilities. Additional laboratories will permit the consolidation of these experiments at the CRF, thus providing the necessary access to the unique capabilities at the Facility. It will also provide adequate space and ready access to visiting scientists.

The number of offices required to support visiting researchers and staff must also be increased as each year of operation brings a large number of requests from qualified researchers to do work here who stay longer.

This addition is crucial to continuation of the lead role the CRF now plays in developing, improving, and applying advanced research methods for combustion science. As a result of successful technology transfer from the CRF to visiting scientists, there has been a significant advance in the research methods practiced by the combustion community. Given the increasingly difficult challenges faced in the use of fuel resources, the CRF mission must continue to emphasize advancing the frontiers of combustion science.

Without Phase II the technology at the CRF will stagnate, and opportunities for important new scientific research will be missed. The major advances in lasers and computers will not be brought to bear on pressing problems, nor made available to combustion researchers and designers in this country. CRF Phase II is also crucial to the success of programs in combustion research and diagnostics development. Currently, progress is hampered by the fractionation of the research effort. A significant amount of the experimental activities are housed in other buildings without direct access to the Facility lasers and other resources. Some of the activities are in security areas where it is difficult or impossible for uncleared visiting researchers to work. Moreover, the major portion of the diagnostics research is housed in a converted warehouse; it is essential that this activity be moved to an area that provides cleaner air, better temperature control, improved safety, access to the Facility lasers, and unrestricted availability to users.

1.	Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. 2b.	Project No. 96-E-300 Construction Funded

Finally, without the Phase II addition to the Facility, the size of the visiting scientist (user) program will have to be curtailed, due to the saturation of laboratory and office space. As a result, the ability for the combustion community to move on to more complex, yet realistically important research topics, will be constrained.

The $9 million of FY 1997 funds will be used in part for completing project management, construction management, and inspection of the 11,100 square foot office addition. The remainder of the funds will be used to complete design, place a construction contract, and initiate construction for the 21,200 square foot laboratory expansion and mechanical building modification.

9. Details of Cost Estimate	Unit Cost	Item Cost	Total Cost
a. Engineering, design, and inspection (ED&I)			$3,100
1. Engineering, design, and inspection at approximately 15 percent of construction		2,050	
2. Construction management costs		500	
3. Project management		550	
b. Construction costs			14,610
1. Improvements to land		1,010	
Paving, walkways, landscaping, fencing, signage, road relocation parking lot rearrangement			
2. Buildings		12,800	
(a) Office Building (11,000 SF $190/SF)	2,300		
(b) Laboratory Building (21,200 SF $415/SF)	9,740		
(c) Mechanical Building (Existing)	760		
3. Utilities		800	
Water, sanitary sewer, natural gas, site lighting, electrical power, signal systems			
c. Standard equipment			5,450
Lasers, spectrometers, analyzers, processing equipment			
Subtotal			23,160
d. Contingency at approximately 16 percent of above costs			3,640
Total line item cost			$26,800

9. Details of Cost Estimate: (Continued)

ED&I costs for Title I and II reflect negotiated contract fees. ED&I for Title III is based on a negotiated fee plus an allowance for an extended period of construction, and for escalation. Construction costs and equipment costs have been escalated to mid points of construction and equipment procurement and installation. Escalation rates are in agreement with the DOE Price Change Index dated August 1993 for DOE construction projects, published by the DOE Independent Cost Estimating Staff.

Contingency is judged to be adequate for the remainder of the project. Construction of the laboratory shell was completed in FY 1990. Design was completed for the balance of the construction work in FY 1989. As a result of zero appropriations in FY 1989 through FY 1995 and the consequential schedule extension, some remaining ED&I and Project Management funds will be expended on obsolete Title II design elements prior to going to bid for remaining construction.

10. Method of Performance

Engineering, design, and inspection will be performed under negotiated architect and engineer contracts. Construction, procurement of equipment, and occupancy will be accomplished by fixed price contracts awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	FY 1998	FY 1999	Total
a. Total project funding							
1. Total facility costs							
(a) Line item	$4,205	$ 4	$1,700	$ 9,400	$ 6,800	$4,691	$26,800
Total direct cost	4,205	4	1,700	9,400	6,800	4,691	26,800
2. Other project costs							
(a) Other project costs	220	0	0	500	750	750	2,220
(b) Capital equipment	0	0	0	500	250	250	1,000
Total other project costs	220	0	0	1,000	1,000	1,000	3,220
Total project cost (TPC)	$4,425	$ 4	$1,700	$10,400	$ 7,800	$5,691	$30,020

1. Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. Project No. 96-E-300 2b. Construction Funded

11. Schedule of Project Funding and Other Related Funding Requirements (Continued)

b. Related annual costs a/ (estimated life of building: 50 years)

1. Facility operating costs	$ 300
2. Programmatic operating expenses directly related the facility	2,400
3. Capital equipment not related to construction but related to the programmatic effort in the facility	400
4. GPP or other construction related to programmatic effort in the facility	200
5. Other costs	0
Total related annual costs	$ 3,300

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project costs:

1. Total facility costs
   (a) Construction Line Item as described in previous items.
2. Other project costs
   (a) Other project costs
   $220,000 of operating funds have been paid to architect engineering firms for preparation of conceptual designs/conceptual design reports and supplemental information for this project. $500,000 in FY 1997, $750,000 in FY 1998, and $750,000 in FY 1999, are operating costs associated with the new facility.
   (b) $500,000 in FY 1997, $250,000 in FY 1998, and $250,000 in FY 1999 is for capital equipment associated with the new facility.

a/ Estimated costs in thousands escalated to 1999-year dollars. The related annual funding displayed is related to CRF, Phase II project only. These amounts are in addition to annual funding for the existing CRF operations ($4,739,000 in the FY 1997 OMB Budget Request).

1. Title and Location of Project:	Combustion Research Facility, Phase II Sandia National Laboratories Livermore, California	2a. Project No. 96-E-300 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (Continued)

b. Related annual costs:

1. Facility operating costs
   This cost represents the annual operating expenses for utilities, maintenance, and janitorial service incurred due to the increase of 32,300 gross square feet in laboratory and office space.
2. Programmatic operating expenses
   Staff increase resulting from this project is estimated to be six people. Costs also include acquisition of computer resources that will serve both resident staff and visiting scientists.
3. Capital equipment not related to construction
   The increase in annual capital equipment is estimated at $400,000. This is in addition to Capital Equipment funds currently allocated to the CRF.
4. Maintenance, repair, GPP or other construction related to programmatic effort
   The annual GPP needs for Phase II are expected to be approximately $200,000. This is in addition to GPP funds presently allocated to the CRF.
5. Other costs
   No other costs are anticipated.

919

ENERGY RESEARCH ANALYSES

PROGRAM MISSION

The mission of the Energy Research Analyses (ERA) program is to evaluate the quality and impact of Department of Energy research programs and projects.

The GOAL of the ERA program is to:

Provide Department of Energy program managers and senior managers with objective assessments of research projects and programs in order to evaluate the quality and impact of these efforts, to identify undesirable duplications and gaps, and to provide analysis of key technical issues in support of long range energy research planning, science and technology planning, and technical evaluation of departmental programs and objectives.

The OBJECTIVES related to these goals are:

1. To PROVIDE THE BASIS FOR JUDGMENTS ON THE QUALITY OF RESEARCH AND ITS IMPACT. Using merit review with peer evaluation, provide departmental program managers and their superiors with detailed information about the technical strengths and weaknesses of projects that comprise the R&D program as a basis for judgment of the quality of the research and its impact.

2. To PROVIDE INDEPENDENT VIEWS OF FUTURE R&D NEEDS IN AREAS OF INTEREST TO THE DEPARTMENT. Evaluate the status of science and technology areas of potential importance to the Department's mission, and to lay out appropriate fundamental and applied research and development to hasten the advance towards potential energy applications.

3. To DEVELOP STRATEGIC PLANS. Use advice from outside experts, advisory committees, departmental managers, national laboratory managers, industrial scientists and managers, and officials of other government agencies to formulate strategic plans for the Office of Energy Research and for the Science and Technology business line of the Department.

PROGRAM MISSION - ENERGY RESEARCH ANALYSES (Cont'd)

4. To CONTRIBUTE TO DOE AND INTERAGENCY PROGRAM ANALYSIS AND PLANNING FOR GOVERNMENT SCIENCE AND TECHNOLOGY. Participate in committees, task forces, working groups, and workshops of the Department of Energy and organizations such as the National Science and Technology Council, the National Science Foundation, the National Academy of Sciences, and private sector organizations such as the Industrial Research Institute, and the Electric Power Research Institute.

PERFORMANCE MEASURES:

1. Quality and value of peer review evaluations, as indicated by satisfaction of investigators and program managers and actions taken to improve or replace projects that have significant shortcomings, and to capitalize on the strengths of stronger projects.

2. Satisfaction by customer program managers with assessments of science and technology needs, as indicated by changes or additions to make DOE programs and projects more productive and relevant to DOE missions.

3. Quality and acceptance of strategic plans, as indicated by their use by the Director of the Office of Energy Research and by program offices in multi-year program planning, program budget planning, and in effectively justifying programs.

4. Influence on government science and technology planning and analysis, as indicated by contributions to DOE, interagency, and outside recommendations on science policies and plans.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

1. Independent peer reviews have verified the quality and relevance of over 300 DOE projects and tasks. Assessment of research needs for Advanced Heterogeneous Catalysts for Energy Applications was completed. These levels of effort will be scaled down in FY 1997 to accommodate the reduced funding associated with the Department's realignment of staff and activities.

2. An improved and systematic process for appraisal of Energy Research Laboratories will be developed in FY 1996. Implementation by this program for the Office of Energy research will continue in FY 1997.

3. A new DOE-wide system for simplified technical reviews of National Laboratories has been developed with the participation of all affected parties, including the National Laboratories and DOE Operations Offices. The new system will be tested in a pilot process in FY 1996 at three National Laboratories and implemented across the Department in FY 1997.

PROGRAM MISSION - ENERGY RESEARCH ANALYSES (Cont'd)

4. Developed the Strategic Plan for the Office of Energy Research. Provided science and technology sections of the National Energy Policy Plan (NEPP). Coordinated the formulation of ER technology status reports for the Yergin Task Force.

ENERGY RESEARCH ANALYSES

(Tabular dollars in thousands. Narrative in whole dollars.)

I. Mission Supporting Goals and Objectives

The Energy Research Analyses (ERA) program assesses research projects and programs in order to judge the significance of these efforts and to identify undesirable duplications and gaps. Peer reviews of individual research projects using outside experts are performed. Technical assessments to determine the direction of future research and state-of-the-science reviews are also performed. The program also provides analysis in support of long range energy research planning, science and technology planning, and technical evaluation of DOE programs and objectives.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Energy Research Analyses	$ 3,330	$ 3,414	$ 2,000	$ -1,414	-41.4%
Total, Energy Research Analyses	$ 3,330	$ 3,414	$ 2,000	$ -1,414	-41.4%

926

III. Performance Summary

FY 1995 Accomplishments:

- Determined the strengths and weaknesses of 300 projects in Energy Research, Fossil Energy, and Energy Efficiency by independent peer review, including quality of the science, relevance to DOE and national missions, and research management.
- Determined the need for new, specific research in the area of Advanced Heterogeneous Catalysts for Energy Applications.
- Provided the DOE support for management of the National Acid Precipitation Program Assessment (NAPAP) Program.

23-254 96 - 30

III. Performance Summary: ENERGY RESEARCH ANALYSES (Cont'd)

- Developed the Strategic Plan for the Office of Energy Research. Provided science and technology sections of the National Energy Policy Plan (NEPP). Coordinated the formulation of ER technology status reports for the Yergin Task Force.

- Analyzed specific governmental and Departmental R&D issues using expert technical groups at the National Academy of Sciences, the Keystone Center, the JASON group, the Foreign Area Science Assessment Center (FASAC), and the Japan Technology Evaluation Center (JTEC).

- Funding in the amount of $66,000 and $3,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned)

- Develop a simplified and improved DOE-wide technical review process, as promised by the Secretary of Energy to the Congress. Organize and manage a pilot program at three National Laboratories to evaluate the new review process.

- Evaluate the quality and relevance of approximately 275 projects in Energy Research, Fossil Energy, and Energy Efficiency by independent peer reviews.

- Assess additional technical needs in Energy Research, Fossil Energy, and Energy Efficiency (e.g., advanced composite materials).

- Develop a new and improved Laboratory appraisal process to evaluate the performance of ER Laboratories on an annual basis as part of the Department's new performance-based contracting system.

- Support external R&D review of critical issues, as requested by the Director, Office of Energy Research, through groups outside the Department of Energy, (e.g., the National Academy of Sciences, and the JASON group).

- Funding in the amount of $69,000 and $5,000 has been budgeted for the SBIR and STTR programs, respectively.

927

III. **Performance Summary: ENERGY RESEARCH ANALYSES** (Cont'd)

FY 1997 Planned Accomplishments:

- Update and improve the Energy Research Strategic Plan to establish a new vision and mission, and to get maximum research value from, the realigned Office of Energy Research.
- Continue to improve the quality and relevance of DOE research and development programs through peer reviews of approximately 200 projects in Energy Research, Fossil Energy, and Energy Efficiency.
- Evaluate critical planning and policy issues of DOE science and technology through reviews by expert groups at the National Academy of Sciences, the JASON group, etc., as appropriate.
- Funding in the amount of $50,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease reflects a reduction in the number of peer reviews conducted from 275 in FY 1996 to 200 in FY 1997 ($-1,414,000).

928

UNIVERSITY AND SCIENCE EDUCATION

PROGRAM MISSION

The University and Science Education Program (USE) supports activities that utilize the scientific and technical resources of the Department of Energy's laboratories to enhance the development of a diverse, well-educated and scientifically literate workforce. USE's centralized institutional support for the Department's education efforts enables all DOE research and technical program areas to provide hands-on research experiences for students and faculty at the Department's laboratories and minimizes department-wide administrative cost. USE is the lead program for the Department's role in providing support to the national effort to improve science education for all students.

The Office of Laboratory Policy and Infrastructure Management, which reports to the Director of the Office of Energy Research, manages the USE program. The office is responsible for providing leadership and program support necessary to use and leverage the resources of the Department's laboratories to help replenish the pool of scientists and engineers, and to achieve significant, long-term improvements in their science and technology skills, primarily through hands-on experiences at the laboratories.

The GOAL of the University and Science Education Program is to:

Ensure that the Department effectively utilizes and leverages the resources of the DOE laboratory system to support the Department's university and science education mission.

The OBJECTIVES related to this goal are to:

1. Provide opportunities and effective mechanisms for students and faculty to utilize the Department's laboratories for hands-on research experiences.

2. Support increased participation of under-represented populations in science and engineering.

3. Utilize DOE laboratory resources to contribute to systemic science education reform.

PROGRAM MISSION - UNIVERSITY AND SCIENCE EDUCATION (Cont'd)

4. Provide the infrastructure for the Department's laboratory science education programs.

PERFORMANCE MEASURES:

Performance measures for the University and Science Education Program are both qualitative and quantitative. The quality of the program will be measured by improvement in performance of the DOE Laboratory Science Education Programs.

1. Enhanced opportunities at DOE laboratories to improve students/teachers' understanding of science and mathematics.

2. Improved flow of underrepresented students into science and math programs/careers achieved.

3. Cost sharing for program initiatives.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Through the Science and Engineering Research Semester (SERS) nearly 400 undergraduates had the opportunity to spend an academic term working side-by-side with scientists at DOE's national laboratories. In addition to gaining valuable personal experience, these students helped DOE scientists advance their ongoing research.

- The infrastructure supported by the Laboratory Cooperative Program enabled nearly 2000 college and university faculty and students to participate in collaborative hands-on research with the scientists from DOE's national laboratories. Participants in these programs brought fresh ideas to the Department's research endeavors, and carried "state-of-the-art" knowledge and experience from our laboratories back to their universities to infuse into their institutions academic programs. Training provided by the laboratories through Laboratory Cooperative Program workshops and conferences provided an additional 1500 college-level participants with new skills in developing areas of science like parallel computation, an area of computer science in which the laboratories have played a leading role.

- Over 100 undergraduate students and 50 faculty involved in DOE-laboratory partnership efforts with Historically Black Colleges and Universities (HBCU) and other minority institutions participated in hands-on research with DOE laboratory scientists.

PROGRAM MISSION - UNIVERSITY AND SCIENCE EDUCATION (Cont'd)

- Nearly 3000 precollege teachers participated in 52 laboratory-based research participation experiences and over 3500 teachers participated in workshops or institutes at DOE laboratories. DOE's work with teachers and their school systems is clearly beginning to pay dividends. With support of DOE's Princeton Plasma Physics Laboratory's science education reform efforts, the Trenton, New Jersey, public school system reports significantly improved standardized test scores systemwide.

- Recently transferred to the Basic Energy Sciences program in the Office of Energy Research, several significant accomplishments were realized in the Experimental Program to Stimulate Competitive Research (EPSCoR) in FY 1995. DOE/EPSCoR increased the number of state Implementation Awards from seven to nine. Additionally, the integration of DOE/EPSCoR faculty into the larger science community is essential if EPSCoR states are to enhance their funding competitiveness. Over 100 new interactions between DOE scientists and EPSCoR faculty were established over the past year.

- The University Research Instrumentation Program awarded 21 grants in FY 1995. These awards allowed DOE-supported university researchers to purchase unique, state-of-the-art equipment to continue, expand or accelerate existing energy-related research.

- Forty-six grants to colleges and community colleges were awarded for the Pre-Freshman Enrichment Program. The purpose of this program is to introduce science and math-based activities to students in grades 6-10. These students represent populations historically underutilized in science-based careers. Cost-sharing with local businesses and industry is typical.

- As a result of a budget reduction of approximately $42 million and Congressional report guidance, a considerable shift in emphasis has occurred between FY 1995 and FY 1996. In restructuring the program to maximize the resources available to summer and academic-term, laboratory-based research participation activities, precollege science education outreach projects have been reduced from several hundred to fewer than twenty.

- Precollege activities that capitalize on leveraged previous investments and partnerships, and summer and academic laboratory-based research assignments have been continued. While laboratory-based programs are our highest priority, the severity of the FY 1996 budget reductions have also required cutbacks in college level faculty and student intern and collaborative research appointments. No new postdoctoral research fellows are being appointed and substantial reductions were required in support for minority and outreach efforts.

UNIVERSITY AND SCIENCE EDUCATION

PROGRAM PERFORMANCE SUMMARY
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives

Activities supported by University and Science Education programs ensure the effective utilization of DOE's laboratory system to support the Department's university and science education mission by enhancing the capabilities of faculty and students through hands-on research experiences at DOE national laboratories, by increasing the diversity of the scientific workforce, by utilizing laboratory resources to contribute to systemic science education reform, and by providing the infrastructure for the Department's laboratory-based science education programs.

Laboratory Cooperative Program

The Laboratory Cooperative Program is the Department's primary vehicle for providing faculty and students with access to its national laboratories. The program provides participants with access to state-of-the-art scientific equipment, techniques and ideas and enables them to further develop their critical thinking and analytical skills. The laboratory-based institutional support provided by the Laboratory Coop Program ensures accurate participant placement across all of DOE's research and technical program areas and monitors the quality of their research experiences. Minority students and faculty are particularly sought out and encouraged to participate in the Laboratory Cooperative Program. From the many thousands of applications the Laboratory Cooperative Program receives annually, it is clear that DOE's research participation appointments are highly regarded and that these opportunities play and important role in the science education program of the country.

University Programs

The University Programs subcategory includes support for university-based efforts directed at encouraging more young people, including minorities and women, to pursue energy-related scientific and technical careers. Support is being requested to sustain DOE laboratory minority university alliances as well as other Administration and Congressionally recommended efforts. In addition, funds are being requested to continue the Department's Prefreshman Enrichment Program (PREP) with emphasis on HBCU and minority institutions supporting summer workshops in mathematics, science and engineering on their campuses.

PROGRAM PERFORMANCE SUMMARY (Cont'd)

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Laboratory Cooperative Programs...	$29,607	$13,000	$13,900	$+ 900	+ 6.9%
University Programs.....	26,423	5,900	6,000	+ 100	+ 1.7%
University Research Instr. Program	5,431	0	0	0	0.0%
Total, USE.....	$61,461	$18,900	$19,900	$+ 1,000	+ 5.3%

III. Performance Summary:

FY 1995 Accomplishments

- Nearly 400 undergraduates gained valuable research experience and helped DOE scientists advance the national laboratories ongoing research programs through participation in the academic-year Science and Engineering Research Semester (SERS). An additional 2000 faculty and students participated in collaborative hands-on research during the summer through the Laboratory Cooperative Program. Participants in both programs brought new perspectives to the Department's research endeavors and carried away new skills and ideas to their college and university campuses.

- Laboratory Cooperative Program workshops and conferences provided an additional 1500 college-level participants with new skills in developing areas of science like parallel computation, an area of computer science in which the laboratories have played a leading role.

- Over 100 undergraduate students and 50 faculty from Historically Black Colleges and Universities (HBCU) and other minority institutions participated in hands-on research with DOE laboratory scientists.

- Nearly 3000 precollege teachers participated in 52 laboratory-based research participation experiences and over 3500 teachers participated in laboratory-sponsored education workshops or institutions. Such efforts, like that supported by DOE's Princeton Plasma Physics Laboratory's in Trenton, New Jersey's public school system, has contributed to significantly improved standardized student test scores systemwide.

III. PERFORMANCE SUMMARY (Cont'd)

- The Department of Energy's Experimental Program to Stimulate Competitive Research (EPSCoR) increased the number of state Implementation Awards from seven to nine in FY 1995. Additionally, over 100 new interactions between DOE scientists and EPSCoR faculty were established over the past year thereby helping integrate faculty and students from EPSCoR states into the larger science community.

- Twenty-one University Research Instrumentation awards allowed DOE-supported university researchers to purchase unique, state-of-the-art equipment to further enhance their existing energy-related research projects.

- Through Pre-Freshman Enrichment Program (PREP) grants that are cost shared with local businesses and industry, 46 colleges and community colleges were able to introduce science and math-based activities to grade 6-10 students from minority communities.

- Funding in the amount of $1,078,000 and $54,000 has been transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- In restructuring the program to maximize the resources available to laboratory-based research participation activities, the number of precollege science education outreach projects has been reduced from several hundred to less than twenty. Those precollege activities that remain capitalize on previous investments and partnerships, including education efforts with the National Science Foundation. Despite the positive accomplishments of these precollege activities, these programs are being funded at a significantly reduced levels.

- Due to the severity of the FY 1996 appropriation, support for faculty and student intern and collaborative research appointments, while our highest priority, is being reduced to early 1990 funding levels. No new postdoctoral research fellows are being appointed and significant reductions are necessary in support for congressionally recommended minority and outreach efforts. Cost sharing with other DOE programs is being sought to maintain as many excellent activities as possible at a viable level.

- Funding in the amount of $368,000 and $28,000 has been budgeted for the SBIR and STTR programs, respectively.

III. PERFORMANCE SUMMARY (Cont'd)

FY 1997 Planned Accomplishments:

- Increase the number of undergraduate and graduate participants in the Laboratory Cooperative Education Program by 5%.
- Increase coordination with other DOE programs and improve integration of science education activities.
- Sustain support for high priority Administration and Congressional programs.
- Establish a developmental award program for faculty and students from primarily undergraduate institutions and minority institutions that stimulates collaborations with DOE national laboratory scientific staff and enhances faculty grant competitiveness.
- Increase coordination with other agencies.
- Partner with NSF in support of its Minority Institutes of Excellence program to enhance coordination and effectiveness of support for undergraduate programs at HBCUs.
- Funding in the amount of $498,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

- The increase of $1,000,000 in FY 1997 University and Science Education funding will enable the Department to provide an adequate base program focused on longer term research assignments of undergraduates, graduate students and faculty at DOE laboratories. It also provides a level of science education institutional support that allows DOE's research groups and technical program offices to optimize student and faculty internships and collaborative involvement in ongoing DOE research. This approach is consistent with Congressional guidance, supports the Administration's science education goals, and will result in increased efficiency and effectiveness in carrying out the restructured programmatic initiatives in close collaboration with DOE programs and other agencies, such as NSF.

COMPUTATIONAL AND TECHNOLOGY RESEARCH

PROGRAM MISSION

The mission of the Computational and Technology Research (CTR) program is to perform long-term computational, technology, and advanced energy projects research in support of the goals of the Office of Energy Research strategic plan, and the mission of the Department of Energy (DOE).

The GOAL of the CTR program is to:

Conduct an integrated program in applied mathematical sciences, high performance computing and communications, information infrastructure, advanced energy projects research, and technology research, to address complex problems. Research in forefront and diverse programs is becoming more multidisciplinary and requires new approaches to the solution of these complex problems. The program exploits the capabilities and research skills at universities, national laboratories, and industrial research laboratories. The CTR program provides technical, analytical, and management direction for development, implementation, and evaluation of research programs that include activities from fundamental research to technology development. This includes activities such as High Performance Computing and Communications, the National Information Infrastructure, the Computational Technology program, and the joint Energy Research-Defense Programs DOE 2000 initiative. The Office of Computational and Technology Research also manages the SBIR and STTR programs, contributing additional experience and expertise to CTR program management. The program explores advanced energy concepts at an earlier stage of development than departmental energy technology programs. Technology activities include the cost-shared laboratory Cooperative Research and Development Agreements (CRADAs), technical assistance to small business and the Environmental Technology Partnerships. An effort in Intelligent Energy Processes is an important element in the integrated research program. The program works closely with other Energy Research and departmental programs.

PROGRAM MISSION - COMPUTATIONAL AND TECHNOLOGY RESEARCH (Cont'd)

The OBJECTIVES related to these goals are:

1. To CONTRIBUTE TO SUSTAINABLE ENERGY PRODUCTION AND USE - Conduct research that creates scientific and engineering knowledge in support of Department of Energy mission thrusts to accelerate the utilization and development of energy technologies in a safe and environmentally compatible manner.

2. To PROVIDE WORLD CLASS COMPUTING FACILITIES - Provide and operate major user supercomputer facilities needed for DOE research and foster research partnerships with industry and the entire scientific community. These facilities include the National Energy Research Supercomputer Center (NERSC) at Lawrence Berkeley National Laboratory, Los Alamos National Laboratory, Oak Ridge National Laboratory, and supercomputer centers that are essential forefront research tools that scientists and engineers use to advance knowledge and develop new products, materials, and manufacturing processes.

3. To ENSURE THAT RESEARCH RESULTS ARE WIDELY KNOWN, VALUED and USED - Promote open communications and the transfer of information and technology among universities, government, and the private sector. Activities include peer-review of research activities, presentation of results at meetings and in peer-reviewed scientific journals, and strong coordination and planning with the energy technology offices of the Department, collocation of researchers, input from all stakeholders, and in-depth workshops and conferences between scientists and engineers with management sponsorship and participation. The national laboratories and universities are unique resources to bring about many of these important interactions.

940

MAJOR ACTIVITIES:

1. Mathematical, Information, and Computational Sciences:
Supports forefront, diverse applied mathematical sciences, high performance computing, communications and information infrastructure research that spans the spectrum of activities from strategic fundamental research to technology development and demonstration.

2. Laboratory Technology Research:
Supports high risk, long-term technology research that brings research results to the stage where industry and DOE technology programs can exploit the new technologies.

PROGRAM MISSION - COMPUTATIONAL AND TECHNOLOGY RESEARCH (Cont'd)

3. Advanced Energy Projects:
   Supports research to establish the feasibility of novel, high risk/high payoff energy-related concepts that span the Department's energy mission and goals.

Scientific Facilities Utilization:

The Computational and Technology Research program request includes $28,000,000 in FY 1997 to support the NERSC. This will maintain support of the President's User Facility Initiative in FY 1996. Approximately 12% of this amount is associated with the continuation of the science user facilities initiative contained in the FY 1996 budget request. This investment will provide research time for about 5,000 scientists in universities, Federal agencies, and U.S. companies. It will also leverage both Federally and privately sponsored research, consistent with the Administration's strategy for enhancing the U.S. National science investment. The proposed funding supports the number of users served in FY 1996, which was an increase over FY 1995 levels, and will maintain the quality of service and availability of facility resources to users, including university and government scientists, as well as private companies who rely on unique facilities for their basic research needs. The proposed funding level will also provide for efficient utilization of high technology facilities, which are generally oversubscribed by factors of two to three. Research communities that will benefit from this initiative include structural biology, materials sciences, superconductor technology, medical research and technology development, plasma sciences, and environmental and atmospheric research.

PERFORMANCE MEASURES:

The Department has developed performance measures for the results of its research activities. General performance measures of program outputs for the CTR program include the number of scientists and engineers supported, the number of publications in peer-reviewed journals and the number of awards from professional organizations recognizing major achievements. Metrics for the transfer of new knowledge to a technology application include the number of cooperative agreements with industry, the number of projects resulting in support from a DOE Energy Technology program, the number of invention records and patents, and the number of users at the major computational facilities.

PROGRAM MISSION - COMPUTATIONAL AND TECHNOLOGY RESEARCH (Cont'd)

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The NERSC has been recompeted to improve program efficiency and will move from Lawrence Livermore National Laboratory to Lawrence Berkeley National Laboratory in FY 1996.
- The conclusion of a number of large scale grand challenge computer modeling projects such as the numerical Tokamak and groundwater transport will result in the refocusing of those resources to support national collaboratories and advanced computational testing and simulation.
- The cooperative funding of the NERSC by the Fusion Energy Sciences program will be assumed by the Mathematical, Information, and Computational Sciences subprogram in FY 1997. The total FY 1997 funding for NERSC is $28,000,000.

MATHEMATICAL, INFORMATION, AND COMPUTATIONAL SCIENCES
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Mathematical, Information, and Computational Sciences (MICS) subprogram is a forefront, diverse applied mathematical sciences, high performance computing, communications and information infrastructure program that spans the spectrum of activities from strategic fundamental research to technology development and demonstration. The diverse activities supported by this program are integrated to support two major strategic thrusts: National Collaboratories (NC) and Advanced Computational Testing and Simulation (ACTS). The thrust in National Collaboratories is developing a set of tools and capabilities that will permit scientists and engineers working at different DOE and other facilities to collaborate on solving problems as easily as if they were in the same building. The thrust in Advanced Computational Testing and Simulation is developing an integrated set of algorithms, software tools and infrastructure that will enable computer simulation to better complement experiment and theory or to be used in place of experiments when real experiments are too dangerous, expensive, or inaccessible. These two strategic thrusts support the underlying mathematical concepts and information technology needs of all DOE mission areas (e.g., Fundamental Research, Defense, Energy Efficiency, Environmental and Fossil programs, etc.). The efforts in these areas are closely coordinated with related activities supported by Defense Programs.

The FY 1997 request includes initial funding for the DOE 2000 initiative. This is a joint Energy Research - Defense Programs effort to develop and test a common technology base that supports both National Collaboratories and Advanced Computational Testing and Simulation. Efforts are underway to extend the DOE 2000 initiative to other DOE programs and other agencies as it matures.

The MICS subprogram also supports and responds to the Energy Policy Act (EPACT) and to the High Performance Computing Act of 1991 and provides supercomputer access and advanced communication capabilities, through the Energy Sciences Computer Network (ESnet), to scientific researchers. Finally, the MICS subprogram also serves as an advocate within the Department to formulate and coordinate the Department's National Information Infrastructure (NII) initiative, especially to promote economically beneficial energy-related "National Challenges" applications such as energy demand and supply management and to develop the underlying technologies to enable these applications.

III. Performance Summary: MATHEMATICAL, INFORMATION, AND COMPUTATIONAL SCIENCES (Cont'd)

Performance measures for ACTS include the number of new mathematical algorithms and approaches developed for DOE mission critical application areas, the scope, completeness, and breadth of application of the ACTS software framework, and the acceptance by scientific computing users of ACTS tools. Performance measures for NC include the number of sites supplied with upgraded ESnet services, the scope of deployment of the ESnet-wide security architecture, the number of groups provided with tools for remote access to experimental facilities, and the number of new remote collaboration tools developed and deployed.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Mathematical, Computational, and Computer Sciences Research	$ 51,143	$ 51,240	$ 50,398	$- 842	- 1.6%
Advanced Computation, Communications, and Associated Activities	63,422	61,900	67,889	+ 5,989	+ 9.7%
Total, Mathematical, Information, and Computational Sciences	$114,565	$113,140	$118,287	$+ 5,147	+ 4.5%

III. Performance Summary:

FY 1995 Accomplishments:

- Upgraded ten sites on the Energy Sciences Network (ESnet) to Asynchronous Transfer Mode (ATM) service to improve performance.
- Developed prototype software to allow remote access to Advanced Light Source experiments across ESnet.
- Coordinated definition of a National Collaboratory framework that could be used for both open and secure National Collaboratories.

III. Performance Summary: MATHEMATICAL, INFORMATION, AND COMPUTATIONAL SCIENCES (Cont'd)

- Developed new algorithms for improved simulation of compressible fluid dynamics for use in combustion research, groundwater transport, global climate, and weapons simulations.
- Conducted the largest molecular dynamics simulation in history (1 billion atoms).
- Initiated an interagency project with the Advanced Research Project Agency, the National Aeronautics and Space Administration, and the National Science Foundation on improved Input/Output (I/O) software for massively parallel computers to address a critical issue in the maturation of these technologies.
- Developed two new virtual reality (VR) paradigms for understanding complex scientific data such as materials structures that improve the speed with which scientists can understand results by at least a factor of 10.
- Funding in the amount of $2,146,000 and $107,000 was transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- Upgrade an additional ten sites on ESnet to ATM services.
- Deploy ESnet-wide security architecture and security tools.
- First test of virtual environments linked across a wide area network.
- First deployment to users of software developed to allow remote access to Advanced Light Source experiments across ESnet.
- Coordinate definition (with DOE Defense Programs) of the interfaces that allow new collaborative tools to be incorporated into National Collaboratory framework.
- Add security, privacy, and resource reservation to DOE workstation video/audio and other remote collaboration software.
- Initiate deployment of massively parallel computer in supercomputer access program.

III. Performance Summary: MATHEMATICAL, INFORMATION, AND COMPUTATIONAL SCIENCES (Cont'd)

- o Establish interoperability of virtual reality technologies to explore domains of most advantageous use of these two technologies.
- o Coordinate definition (with DOE Defense Programs) of the interfaces that allow new ACTS tools to be incorporated into a unified ACTS toolkit.
- o Deploy advanced scientific data management technologies to scientific users.
- o Evaluate strategies for producing large applications software packages that can be executed in environments ranging from networks of workstations to the highest performance massively parallel processors available.
- o Funding in the amount of $2,044,000 and $153,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- o Upgrade ESnet bandwidth services to support high speed Program Integration and ACTS applications as part of the DOE 2000 initiative.
- o Integrate existing collaborative tools into National Collaboratory framework.
- o Implement advanced technologies for information security to support flexible administration of resources.
- o Production deployment of remote access software to a number of experimental groups.
- o Address issues of navigation and context in National Collaboratories.
- o Begin preparing one additional DOE experimental facility for remote access.
- o Full deployment of massively parallel computer in supercomputer access program.
- o Integrate most critical existing software tools into ACTS framework as part of the DOE 2000 initiative.

III. Performance Summary: MATHEMATICAL, INFORMATION, AND COMPUTATIONAL SCIENCES (Cont'd)

- Begin development of ACTS-enabled applications development in compressible fluid dynamics/combustion, environmental chemistry, and materials sciences. (This effort is coordinated, as part of the DOE 2000 initiative, with parallel development in DOE Defense Programs of ACTS-enabled applications in weapons hydrodynamics and materials characterization and aging.)

- Funding in the amount of $2,957,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

The net increase in funding ($+5,147,000) is due to enhanced efforts in National Collaboratories and Advanced Computational Testing and Simulation in support of the DOE 2000 initiative

COMPUTATIONAL AND TECHNOLOGY RESEARCH

LABORATORY TECHNOLOGY RESEARCH
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Laboratory Technology Research subprogram conducts technology research projects in support of Office of Energy Research (ER) goals, as defined by the strategic plan, to reduce technical risk associated with a technology or process development. The program links the basic science at ER national laboratories to applied technologies through leveraged collaborations with industries. The program is focused in critical technology research areas, e.g., intelligent manufacturing processes, tailored materials, and sustainable environments, to contribute technological innovations that will stimulate national economic growth, and to increase the return on the government investment in basic science. For example, research on intelligent processes such as sensor-computer-machine control systems will focus on high risk technological problems for ultimate commercial applications with high payoff. The potential for large payoff is based on the explosive growth in inexpensive computer technologies and the ability to incorporate them into control systems.

Research is conducted through peer-reviewed collaborations, including cost-shared Cooperative Research and Development Agreements (CRADAs), personnel exchanges, technology research and maturation projects, technical assistance/consultations to small business, and major government-industry partnerships with multiple partners.

Performance measures related to laboratory technology research focus on reduction of technical risk. The quality of research is evaluated through peer review, workshops, and site visits. The impact of research output must be assessed in terms of quality of new knowledge gained, its usefulness to subsequent technology development, and its longer term benefit to society. Quantitative performance measures include the level of small business access to ER laboratory expertise, the level of industry cost share, and the number of projects resulting in support from other programs or industry.

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Laboratory Technology Research	$ 46,539	$ 17,659	$ 21,789	$+ 4,130	+ 23.4%
Total, Laboratory Technology Research	$ 46,539	$ 17,659	$ 21,789	$+ 4,130	+ 23.4%

III. Performance Summary:

FY 1995 Accomplishments:

- Continued 62 ongoing multi-year collaboration projects, with 61 new starts.
- Increased technical assistance provided to the entrepreneurial small business sector.
- Increased support for seven AMTEX Partnership projects, with one new start.
- Streamlining of the program and delegation of the merit review process to the laboratories resulted in reduction in CRADA processing time by 50%.
- Concentration of partnerships in laboratory core competencies increased the benefit back to the Department's public missions.
- Environmental research accomplishments included improved treatment processes for toxic metals in ash, recovery of industrial acids for reuse, hazardous waste destruction, and biological treatments for both soil and water remediation.
- Improved DNA sequencing by gel electrophoresis will contribute major cost savings and cut screening times for the Human Genome Project, and for other biomedical and agricultural research projects.
- Improved methodologies for materials characterization, modeling and forming of complex parts, and reduced manufacturing and assembly costs.
- A new coating was developed to protect and extend the life of computer hard disk drives.
- Developed a Variable Frequency Microwave Furnace which was subsequently commercialized and is now being used by DOE researchers to explore innovative methods to break down toxic wastes.

III. Performance Summary: LABORATORY TECHNOLOGY RESEARCH (Cont'd)

- Developed new techniques for the cost-effective machining of ceramics and high-temperature metallic systems that will improve our ability to economically prepare complex parts for harsh environments.

- Funding in the amount of $1,112,000 and $56,000 was transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- Continue support for 90 ongoing multi-year collaboration projects at 5 Energy Research multi-program laboratories (Argonne National Laboratory, Oak Ridge National Laboratory, Brookhaven National Laboratory, Lawrence Berkeley National Laboratory, and Pacific Northwest National Laboratory). No new starts.

- Continue technical assistance/consultations to small businesses.

- Decrease support for the AMTEX Partnership with closure of three projects.

- Eliminate Technology Research activities at five ER single program laboratories (Fermi National Accelerator Laboratory, Ames Laboratory, Princeton Plasma Physics Laboratory, Continuous Electron Beam Accelerator Facility, and Stanford Linear Accelerator Center).

- Funding for severance costs associated with the Technology Partnership Program.

- Funding in the amount of $306,000 and $23,000 has been budgeted for the SBIR and STTR programs.

FY 1997 Planned Accomplishments:

- Continue support for 90 ongoing multi-year collaboration projects in technology research focus areas at 5 ER multi-program laboratories. Includes increased support for intelligent energy processes and computational technology.

- Continue technical assistance/consultations for small businesses.

- Eliminate support for the AMTEX Partnership.

- Funding in the amount of $545,000 has been budgeted for the SBIR program.

III. Performance Summary: LABORATORY TECHNOLOGY RESEARCH (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997:

- o Increased support for Computational Technology projects (+$3,000,000).
- o Increased support for ongoing multi-year laboratory collaborative projects in technology focus areas including intelligent processes (+$3,217,000).
- o Increased support for technical assistance activities (+$2,413,000).
- o Decrease associated with one-time severance costs in FY 1996 (-$1,500,000).
- o Eliminate support for the AMTEX Partnership (-$3,000,000).

COMPUTATIONAL AND TECHNOLOGY RESEARCH

ADVANCED ENERGY PROJECTS
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives

This activity funds research to establish the feasibility of novel, energy-related concepts that span the Department's energy mission and goals. These concepts are usually derived from recent advances in basic research, but require additional research to establish their feasibility. A common theme for each concept is the initial linkage of new, or previously neglected, research results to a practical energy payoff for the Nation, Efforts are typically supported at a level of $300,000 per year for a period of 3 years. Although the funding profile can vary widely among projects in the Advanced Energy Projects (AEP) research portfolio, the 3-year budget period is considered a maximum. A measure of success is demonstrated if the project attains further funding from another source to realize its full potential. Projects are selected from proposals submitted by universities, industrial organizations, non-profit research institutions, and national laboratories. Equal consideration is given to each submission. Funding criteria include scientific merit as judged by peer review.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Advanced Energy Projects	$ 10,461	$ 11,643	$ 11,492	$- 151	- 1.3%
Total, Advanced Energy Projects	$ 10,461	$ 11,643	$ 11,492	$- 151	- 1.3%

III. Performance Summary:

FY 1995 Accomplishments:

- Developed a novel optical method for mapping oil and gas reservoirs.
- Discovered a technique, using plasma physics, for removing pollutants from diesel engine exhaust gases.

III. Performance Summary: ADVANCED ENERGY PROJECTS (Cont'd)

- Conducted research that could lead to a method for the rapid, but sensitive, determination of the structural integrity of materials in a nuclear reactor environment.
- Funding in the amount of $214,000 and $11,000 was transferred to the SBIR and STTR programs, respectively.

FY 1996 Accomplishments (to date and planned):

- Apply novel materials to a high-efficiency, CFC-free refrigeration technique.
- Explore the feasibility of electrically controlled thin films for windows with adjustable tint.
- Investigate a new material that emits blue laser light for a variety of possible applications, including energy-efficient displays.
- Funding in the amount of $224,000 and $17,000 has been budgeted for the SBIR and STTR programs, respectively.

FY 1997 Planned Accomplishments:

- Develop a novel, and potentially highly-efficient approach for converting methane into heat and a new magnetic material that can be fabricated with small feature sizes for use as micromotors.
- Conduct research on the synthesis and characterization of new materials for energy-efficient, optical imaging.
- Explore research on a solar-powered technique for converting carbon dioxide to methanol.
- Initiate new projects in emerging scientific and technical areas consistent with the priorities of the Office of Energy Research and the Department of Energy mission.
- Funding in the amount of $287,000 has been budgeted for the SBIR program.

III. **Performance Summary: ADVANCED ENERGY PROJECTS (Cont'd)**

Explanation of Funding Changes FY 1996 to FY 1997:

Research will continue at a slightly decreased level ($-151,000).

COMPUTATIONAL AND TECHNOLOGY RESEARCH

RELATED CAPITAL FUNDING
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Related Capital Funding subprogram funds Capital Equipment in support of the CTR research program.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 4,213	$ 8,056	$6,575	$- 1,481	- 18.4%
Total, Related Capital Funding	$ 4,213	$ 8,056	$6,575	$- 1,481	- 18.4%

III. Performance Summary:

FY 1995 Accomplishments:

- Supported equipment related to High Performance Computing and Communications activities and Advanced Energy Projects such as workstations, small networking equipment, and supercomputer peripheral items.

FY 1996 Accomplishments (to date and planned):

- Support equipment related to High Performance Computing and Communications activities and Advanced Energy Projects such as workstations, small networking equipment, and supercomputer peripheral items.
- Purchase network hardware for the National Energy Research Supercomputer Center at LBNL in the amount of $2,000,000.
- Purchase high speed disks for storage systems at the National Energy Research Supercomputer Center at LBNL in the amount of $2,000,000.

III. **Performance Summary: RELATED CAPITAL FUNDING (Cont'd)**

FY 1997 Planned Accomplishments:

- o Support equipment related to High Performance Computing and Communications and Advanced Energy Projects such as workstations, small networking equipment, and supercomputer peripheral items.
- o Purchase advanced file computer storage hardware at the National Energy Research Supercomputer Center at LBNL in the amount of $2,000,000.

Explanation of Funding Changes FY 1996 to FY 1997:

Decreased funding results from the one-time purchase in FY 1996 of data storage hardware and high speed disk drives in support of the National Energy Research Supercomputer Center at LBNL ($-1,481,000).

MULTIPROGRAM ENERGY LABORATORIES - FACILITIES SUPPORT

PROGRAM MISSION

The Multiprogram Energy Laboratories - Facilities Support (MEL-FS) program supports the Department of Energy's Strategic Plan goal to "Provide the science and technology core competencies that enable DOE's other businesses to succeed in their missions" and the Office of Energy Research Strategic Plan goal to "Sustain scientific leadership and improve U.S. Competitiveness by providing world class scientific facilities and Department of Energy Laboratories, with adequate infrastructure." The MEL-FS program provides general purpose infrastructure funding support to ER multiprogram national laboratories - Argonne National Laboratory - East (ANL-E), Brookhaven National Laboratory (BNL), Lawrence Berkeley National Laboratory (LBNL), Oak Ridge National Laboratory (ORNL), and Pacific Northwest National Laboratory (PNNL). These laboratories have over 1,000 buildings with 13.7 million gross square feet of space and an estimated replacement value of over $10 billion. All facilities at these laboratories are government-owned, contractor-operated (GOCO).

The GOAL of the MEL-FS program is:

To ensure that support facilities can meet the Department's research needs primarily by refurbishing or replacing deteriorated, outmoded, unsafe, and inefficient general purpose infrastructure.

The OBJECTIVES related to these goals are:

1. To CORRECT ES&H INADEQUACIES: Address the highest priority ES&H corrective actions as determined by criteria that include: upgrades to fire protection programs; radiological assistance programs; safety and health training programs; pollution prevention through source reductions, recycling, education, design and process initiatives, and implementation of chemical tracking programs; effluent monitoring; air monitoring; emergency response equipment improvements; underground storage tank compliance. Also provides funds for construction to correct ES&H deficiencies including fire safety improvements, sanitary system upgrades and roof replacements.

2. To PRESERVE THE GOVERNMENT INVESTMENT IN THE PHYSICAL PLANT OF THE LABORATORIES IN ORDER TO SERVE RESEARCH AND DEVELOPMENT MISSION ACTIVITIES IN AN EFFICIENT AND EFFECTIVE MANNER: Provide funds for construction to renovate or replace inefficient and unreliable general purpose buildings and infrastructure.

PROGRAM MISSION - MULTIPROGRAM ENERGY LABORATORIES - FACILITIES SUPPORT (Cont'd)

3. To REDUCE THE BACKLOG OF FACILITY DEFICIENCIES AND INSTITUTIONALIZE THE PLANNING FOR INFRASTRUCTURE NEEDS: Support program planning, management, and maintenance activities which include facility condition assessments, life-cycle asset management planning, site development planning, and preparation of annual reports required by Section 2203(d) of the Energy Policy Act of 1992.

4. To CLEANUP, REMOVE, OR TRANSFER INACTIVE SURPLUS ORPHAN FACILITIES: Modify and/or dispose of facilities in a comprehensive and systematic manner in order to reduce surveillance and maintenance costs, eliminate ES&H liabilities, and provide for better utilization of space and land.

PERFORMANCE MEASURES:

Performance measures related to the MEL-FS program are continuously being refined to ensure they 1) incorporate external/internal customers' inputs, 2) drive performance, 3) address the strategic plan, and 4) focus on the effectiveness of the laboratory system. Current performance measures include:

1. The percentage of high priority ES&H needs met.

2. The square feet of substandard building space rehabilitated or eliminated compared with the total square feet of substandard building space.

3. The cumulative average of maintenance backlog amounts for each year of the contract period compared with the baseline maintenance backlog.

4. The number of inactive/surplus facilities disposed.

5. The cost savings associated with renovating versus new construction for activities within the inactive/surplus facilities subprogram.

6. The percentage of projects completed within baseline cost and schedule.

PROGRAM MISSION - MULTIPROGRAM ENERGY LABORATORIES - FACILITIES SUPPORT (Cont'd)

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Progress in Line Item Projects - Four subprojects were completed in FY 1995. Five subprojects are scheduled for completion in FY 1996. The four subprojects scheduled for completion in FY 1997 are the Applied Science Center at Brookhaven National Laboratory, Phase II Fire Safety Improvements at Argonne National Laboratory, the Multiprogram Laboratory Rehabilitation at Pacific Northwest National Laboratory, and the Phase I Fire and Safety Systems Upgrades at Lawrence Berkeley National Laboratory.

MULTIPROGRAM ENERGY LABORATORIES - FACILITIES SUPPORT

INFRASTRUCTURE SUPPORT
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

General Purpose Facility (GPF) activities support the planning, management, and maintenance activities needed by the laboratories to better identify and prioritize infrastructure requirements. These activities include development and implementation of the site facilities planning systems such as facility condition assessments, life-cycle asset management planning, site development planning, Facilities Information Management System, etc. The research funds also support efforts to integrate requirements across laboratories such as those required by the Energy Policy Act (EPACT). Section 2203(d) of this Act requires annual submission of a "plan for conducting future facility maintenance, making repairs, modifications and new additions and constructing new facilities at multiprogram energy laboratories." The research funds further support site-wide maintenance needs related to general purpose facilities.

The Environment, Safety and Health (ES&H) Support activities provide support to correct the highest priority ES&H deficiencies identified in the ES&H Management Plan. The Department undertook a thorough review of the environment, safety and health (ES&H) compliance at its laboratories and has identified deficiencies in the annual DOE ES&H Management Plan. Deficiencies have been identified in the environmental area (e.g., air, water, hazardous materials), and in occupational safety and health, fire protection, emergency preparedness safety and hazards analyses, conduct of operations, configuration management, work practices and radiation protection.

Inactive and Surplus Facilities activities support the Department's policy to maintain only those facilities necessary to effectively and economically perform assigned missions and tasks. It supports this policy by:

- removing inactive/retired facilities that cannot be economically maintained or renovated to house current or planned activities.

- cleaning up inactive areas of operating facilities that pose an operational and liability concern if reused.

- preparing contaminated facilities that qualify for clean-up by EM for transfer.

As research program technologies change over the course of time, some existing general purpose facilities (or portions of them) have become permanently inactive. These facilities must be cleaned up if they are to be reused, or removed if they are determined to be surplus.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
General Purpose Facilities	$ 584	$ 0	$ 485	$+ 485	--
Environment, Safety & Health Support	5,881	6,656	6,478	- 178	- 2.7%
Inactive and Surplus Facilities	490	0	485	+ 485	--
Total, Infrastructure Support	$ 6,955	$ 6,656	$ 7,448	$+ 792	+ 11.9%

III. Performance Summary:

FY 1995 Accomplishments:

- o Increased support for the most critical and highest priority actions and compliance issues identified in the ES&H Management Planning process. Examples are: pollution prevention activities including source reduction; operating permit development; upgrades in environmental monitoring practices and procedures; enhanced hazard assessment and risk prioritization; OSHA workplace improvements; and wildland fire control.

- o Proactively addressed the highest priority cross-laboratory ES&H issues such as identifying and transferring "noteworthy practices" and promoting needed process improvements in high priority areas such as pollution prevention.

- o Eight facilities (21,000 s.f.) were removed thereby eliminating ES&H liabilities and reducing surveillance and maintenance costs. In addition, characterization and disposition of orphan waste and chemicals were performed in two facilities; and two facilities were rehabilitated which allowed for the reuse of 5100 s.f. of inactive shop and laboratory space. One of these rehabilitation projects involved removal of contaminated ventilation ducting in building 331, Inhalation Toxicology Suite, at Pacific Northwest National Laboratory and returned 2700 s.f. of inactive laboratory space to operational status.

- o Held workshops with the DOE site and operations offices, and the laboratories focused on developing a common set of facility management performance measures, improving communications by defining common terminology and establishing expectations and roles of all offices and laboratories.

- o EPACT: EPACT Section 2203(b) "Supporting Research and Technical Analysis": Provided architectural and engineering contractor support to aid in the preparation of a facility policy and plan for the multiprogram energy laboratories as required by Section 2203(d) of the Energy Policy Act of 1992.

III. Performance Summary: Infrastructure Support (Cont'd)

- o Provided support to laboratories for infrastructure planning and management activities, such as support for developing and implementing facility condition assessment surveys and life-cycle asset management planning.

- o Funding in the amount of $142,000 and $7,000 has been transferred to the SBIR program and the STTR program, respectively.

FY 1996 Accomplishments (to date and planned):

- o Continue to support the highest priority actions and compliance issues identified in the ES&H management planning process including: electrical service upgrades, site hydrogeological assessment, natural hazard mitigation, asbestos characterization and remediation, worker safety enhancement, fuel storage and transfer facility upgrade, fire and life safety vegetation management, seismic safety anchors for building systems, perchloric acid hood decontamination, and implementation of 10 CFR 835.

- o Funding in the amount of $133,000 and $10,000 has been budgeted for the SBIR program and the STTR program, respectively.

FY 1997 Planned Accomplishments:

- o Continue to address the highest priority actions and compliance issues identified in the ES&H management planning process including: laser access control, communication equipment upgrade, non-reactor nuclear facility safety documentation, Clean Air Act compliance, 480 volt conduit deficiency correction, ozone depleting substance reduction, underground storage tank removal/replacement, nuclear criticality safety upgrade, and pollution prevention activities.

- o Continue support to determine clean-up/demolition/transfer requirements for high priority contaminated facilities which will be transferred to EM; remove inactive surplus facilities that cannot be transferred to EM; and clean-up/renovate inactive space to return it to operational status.

- o Continue workshops with the DOE site and operations offices, and the laboratories to improve facility management performance measures and communications.

- o Continue to prepare annual update of facilities plan for the multiprogram energy laboratories as required by Section 2203(d) of the Energy Policy Act of 1992.

III. Performance Summary: Infrastructure Support (Cont'd)

- o Continue to provide support to laboratories for infrastructure planning and facility management activities including support for implementing the DOE Facilities Information Management Systems (FIMS), facility condition assessment survey activities, life-cycle asset management planning, and the site development planning process, as well as site-wide maintenance needs related to general purpose facilities.

- o Funding in the amount of $186,000 has been budgeted for the SBIR program.

Explanation of Funding Changes FY 1996 to FY 1997:

- o The increase is for GPF and Inactive and Surplus Facilities activities that had been eliminated in FY 1996 ($+792,000).

970

MULTIPROGRAM ENERGY LABORATORIES - FACILITIES SUPPORT

RELATED CAPITAL FUNDING
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This subprogram provides funding to support capital equipment needs related to ES&H activities at the Energy Research multiprogram national laboratories.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Environment, Safety and Health Equipment . .	$ 500	$ 0	$+ 177	$+ 177	-
Total, Related Capital Funding	$ 500	$ 0	$+ 177	$+ 177	-

III. Performance Summary:

FY 1995 Accomplishments:

o Provided general funds for replacement, upgrade and improvement in health physics equipment and in environmental monitoring as identified in the ES&H Management Plan. Representative examples included: radio transition equipment, site perimeter modeling system, wildland fire management equipment, CFC replacement equipment, and alpha/beta/gamma counter, a mobile filter/dewatering unit, equipment for a photochemical waste stream, and replacement tanks for underground storage tanks.

FY 1996 Accomplishments (to date and planned):

o No activity.

III. **Performance Summary: (Cont'd)**

FY 1997 Planned Accomplishments:

o Continue reducing the backlog of deficiencies by upgrading health physics and environmental monitoring equipment as identified in the ES&H Management Plan. Representative examples will include: purchasing of radio transition equipment, pH conductivity equipment, and oxygen meters; replacing a liquid scintillation system and a halon system; and upgrading an emergency preparation paging system, a dosimetry system, and an exhaust systems.

Explanation of Funding Changes FY 1996 to FY 1997:

o The increase in ES&H equipment reflects the restart of funding after no activity in FY 1996 (+$177,000).

CONSTRUCTION
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This subprogram supports the Program's goal to refurbish or replace inadequate general purpose facilities and infrastructure that support research needs. Facility deficiencies are due to age, obsolescence, extensive use and changing requirements, including Environment, Safety and Health Requirements. This subprogram achieves this by funding line item construction projects (i.e., projects with a total estimated cost of $2 million or above) for general purpose facilities. General purpose facilities are general use, service and support facilities such as administrative space, cafeterias, general office/laboratory space, utility systems, sanitary sewers, roads, etc. There are over 1,000 buildings at the six laboratories covered by this program. These buildings have over 14,000,000 gross square feet of space. Approximately half of the space is considered fully adequate, while the remainder needs rehabilitation or replacement/demolition. The large percentage of inadequate space reflects the age of the facilities (30 years or older), changing research needs that require more office space and light laboratory space, environmental, safety and health requirements and obsolete systems.

Capital investment requirements are identified in laboratory Institutional Plans which address needs over a five year planning horizon based on expected programmatic support. The MEL-FS program has prepared a 5-year program plan that identifies projects totaling over $425 million for the five year period. Forty one percent of this amount is to rehab or replace buildings; 35% is for utility projects; and 24% for environment, safety and health projects. All projects are first ranked using the Capital Assets Management Process Prioritization Model. The projects that have environment, safety and health as the principal driver are further prioritized using the Risk Prioritization Model from the DOE ES&H Management Plan process.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
General Purpose Facilities	$ 13,409	$ 12,975	$ 6,960	$- 6,015	- 46.3%
ES&H	7,838	14,474	14,300	- 174	- 1.2%
Total, Construction	$ 21,247	$ 27,449	$ 21,260	$- 6,189	- 22.5%

III. Performance Summary: Construction (Cont'd)

FY 1995 Accomplishments:

o Supported completion/continuation of five Environment, Safety, and Health subprojects consistent with planned schedules and initiation of three new subprojects - a fire safety project, a sanitary system upgrade and a loss prevention upgrade.

o Supported completion/continuation of six General Purpose Facility subprojects consistent with planned schedules and initiation of four new subprojects including one electrical safety project and three building rehab/upgrades. The square footage of new replacement lab and office space is 17,500 square feet.

FY 1996 Accomplishments (to date and planned):

o Support completion/continuation of six Environment, Safety and Health subprojects consistent with planned schedules and initiation of three new subprojects including rehab of hot cells and support systems at BNL, building electrical service upgrade at ANL-E and sanitary sewer restoration at LBNL.

o Supports completion/continuation of eight General Purpose Facility projects.

o No new subprojects initiated.

FY 1997 Planned Accomplishments:

o Support completion/continuation of six Environment, Safety and Health subprojects.

o Supports completion/continuation of three General Purpose Facility subprojects. One ongoing subproject (ORNL Roofing) is not funded delaying completion.

o No new subprojects initiated.

Explanation of Funding Changes FY 1996 to FY 1997:

o The decrease in funding is a result of the overall decrease in MEL-FS program funding. Funding at this level results in one ongoing project (Roofing Improvements, ORNL) not being funded and no new project starts ($-6,189,000).

4a. Date Physical Construction Starts: See subproject details

4b. Date Construction Ends: See subproject details

6. Current Cost Estimate:
TEC -- N/A
TPC -- N/A

7. Financial Schedule: (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Cost
Prior Years	$ 27,856		$ 27,856	$ 20,000
FY 1995	21,247	-1,380 a/	19,867	16,858
FY 1996	27,449		27,449	26,000
FY 1997	21,260		21,260	27,000
Future Years	20,579		20,579	27,153

a/ Reflects $1,328,000 for this program's share of the Energy Supply, Research and Development reduction for use of prior year balances and $52,000 for the Departmental reprogramming.

1. Title and Location of Project:	Multiprogram Energy Laboratories Infrastructure Project Various Locations	2a. Project No. MEL-001 2b. Construction Funded

Project Description, Justification and Scope

This project funds two types of subprojects:

- Projects to correct ES&H deficiencies including fire safety improvements, sanitary system upgrades and electrical system replacements; and

- Projects that renovate or replace inefficient and unreliable general purpose facilities (GPF) including general use, service and support facilities such as administrative space, cafeterias, utility systems, and roads.

General Purpose Facility Projects:

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Central Heating Plant Rehab, I (ANL)	$9,880	$9,500	$ 0	$1,307	$2,631	$2,500	$3,442	3rd Qtr FY 1996	2nd Qtr FY 1999

This project supports rehabilitation/upgrade of central heating plant systems and components that are no longer adequate, efficient or reliable.

Assessments have identified existing conditions at the central heating plant that do not meet current health, safety and environmental protection standards. Phase I will provide the most urgently needed rehabilitation/upgrade, including (as needed): boilers, boiler auxiliaries, deaerators, condensate tanks, material transport, piping valves, pollution control equipment, etc.

977

1. Title and Location of Project: Multiprogram Energy Laboratories
Infrastructure Project
Various Locations

2a. Project No. MEL-001
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Electrical Safety Rehab (PNNL)	4,740	6,800	0	240	1,500	1,500	0	4th Qtr FY 1995	3rd Qtr FY 1998

This project will provide for the rehabilitation of electrical systems and correction of numerous National Electrical Code (NEC) violations in various Energy Research buildings in the 300 areas of the Hanford Site.

Many of the buildings range in age from 20 to 40 years and electrical equipment and installations contained within them do not meet NEC and DOE standards and criteria for safe and efficient operations. This project will safeguard personnel working with the DOE facility electrical systems and enhance the reliability of those systems.

Multiprogram Laboratory Rehab, I (PNNL)	6,100	6,100	0	400	2,740	2,960	0	2nd Qtr FY 1996	4th Qtr FY 1997

This project is part of the Multiprogram Energy Laboratory - Facilities Support Program mission to modernize and renovate aging PNL multiprogram laboratory facilities. This project will involve the remodeling of the 3rd floor of building 331 and construction of a new facility for small animal quarters.

Leading research programs are increasing emphasis on cellular/modular studies and changing use of animal models for the dose-response studies to those which use in vitro/in vivo approaches. As a result, small animal physical facilities need to be renovated or replaced by additional laboratory facilities in which molecular biology and biochemical research can be carried out. This project responds to this new approach.

1. Title and Location of Project: Multiprogram Energy Laboratories Infrastructure Project, Various Locations

2a. Project No. MEL-001

2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
East Canyon Electrical Safety Project (LBNL)	3,854	3,754	2,754	1,000	100	0	0	2nd Qtr FY 1994	3rd Qtr FY 1996

The project is the third of several rehabilitation elements that are part of a master plan to improve the reliability of the electrical distribution system of the entire laboratory. The project will utilize the new circuit breakers provided in FY 1987 by the improvements to the main substation. A new 12kV switching station and new 12kV distribution circuits to laboratory facilities in the East site area will be installed, as will a new 500 kVA substation with standby generation at the National Center for Electron Microscopy.

The existing 12kV power system has major deficiencies. There is no redundancy, so a cable fault will cause extended power outage. There is no ground fault protection, which would result in a loss of power to the entire East Site. Since there is no redundancy, preventive maintenance operations can only be accomplished during scheduled shutdowns of the entire East Site. The power cable is reaching the end of its useful life (21 years of a 25 years maximum) and should be replaced. A new substation at the National Center for Electron Microscopy is required to provide an independent power supply system to this major research facility. Power outages adversely affect the operation of the electron microscopes, requiring long time periods for adjustment and re-calibration of these major scientific instruments.

Safety Compliance Mod., Bldg. 326 (PNNL)	8,540	8,540	6,640	1,900	0	0	0	3rd Qtr FY 1993	2nd Qtr FY 1995

The project brings the 326 Building, which was an aged but strategically important laboratory, into compliance with National Fire Protection Association (NFPA) requirements, National Electric Code requirements, and State of Washington requirements. Since its construction in 1952, the building has been in continuous use. Although the building was structurally sound, it did not meet today's building codes and standards of acceptability for health and safety.

1. Title and Location of Project:	Multiprogram Energy Laboratories Infrastructure Project Various Locations	2a. Project No. MEL-001 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The project now clearly defines the egress pathways from the facility, provide fire resistant stairwells and exit corridors, extensively upgrade the building electrical system to comply with the National Electric code including replacement of most of the electrical distribution system, installation of a new motor control center, installation of backflow prevention on the fire main to meet State of Washington requirements, installation of handicap facilities, installation of full wet-pipe sprinklers to comply with NFPA requirements, and other modifications to meet code requirements.

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Electrical System Upgrade Phase II (ANL)	5,044	4,839	2,796	2,043	205	0	0	3rd Qtr FY 1994	1st Qtr FY 1996

The project supports the upgrade of the main electrical distribution system and major components in the 200 area.

Due to the age of the electrical system, malfunctions have occurred. As maintenance of the switches is becoming increasingly difficult due to a scarcity of spare parts, a complete replacement is recommended to ensure safe, reliable and continuous operation of ongoing research. The new system will employ state of the art technology.

Potable Water System Upgrade, Phase I (BNL)	5,320	5,320	3,457	1,863	0	0	0	2nd Qtr FY 1994	4th Qtr FY 1995

This project began necessary upgrades of the potable water system at Brookhaven National Laboratory. It supported the first of several phases of an overall planned program to rehabilitate and improve the water supply and insure that an adequate supply of good quality water is available beyond the year 2000.

The existing nine potable water wells dated back to 1941. The three oldest wells have been decommissioned because of volatile organic contamination. Only one did not show signs of contamination. The remaining well is capable of producing only half of the water requirements for the laboratory. Steps had to be taken to insure a safe, adequate supply of water into the future. Five carbon absorption filtration units were installed on wells 4, 6, 7, and 12. Eight thousand feet of cast iron piping and 1,750 feet of transite pipe was replaced. The water main was extended approximately 4,000 feet to sewage treatment plant for potable water and fire protection.

1. Title and Location of Project	Multiprogram Energy Laboratories Infrastructure Project Various Locations	2a. Project No. MEL-001 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Fuel Storage and Transfer Facility Upgrade (BNL)	3,600	3,600	681	2,479	440	0	0	2nd Qtr FY 1995	3rd Qtr FY 1996

This project will upgrade the existing fuel storage and transfer facility to bring it into compliance with local and state code for handling and storage of fuel oil.

This facility will consist of fuel transfer facility enclosure with unloading booms and fire detection and protection systems. This facility will be constructed on a diked containment area equipped with leak detection systems and oil/water separator. The enclosure will be approximately 5,600 square feet.

Roofing Improvements (ORNL)	16,000	16,000	3,136	197	2,089	0	10,578	2nd Qtr FY 1994	2nd Qtr FY 2000

This project supports replacement of deteriorated roofing on buildings and facilities throughout ORNL. Requirements are prioritized and those in the worst condition and housing the most critical equipment and activities will have the highest priority.

The purpose of this project is to replace deteriorated roofing on buildings and facilities at ORNL. Seventy percent of the roofs have been in place for more than 20 years. Because of age and deterioration, many of the roofs have developed leaks and require extensive maintenance. This project is needed before leakage problems reach the point that they affect equipment, records and research activities as well as the health and safety of personnel working in the facilities.

1. Title and Location of Project: Multiprogram Energy Laboratories Infrastructure Project, Various Locations

2a. Project No: MEL-001
2b. Construction Funded

8 Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Applied Science Center Phase I (BNL)	3,870	3,870	0	600	3,270	0	0	2nd Qtr FY 1996	2nd Qtr FY 1997

The proposed addition to the Department of Applied Science (DAS) building will provide approximately 12,000 sq. ft. of laboratory, office and support space. The addition will be a two-story structure with an underground passageway. The first floor will be devoted principally to laboratory space with some space for offices, darkroom and bathrooms. The second floor will principally be office space with some space dedicated for a library, lunch room, etc.

The purpose of this project is to consolidate and upgrade the Department's space to alleviate the fragmentation of approximately 240 in-house DAS staff, supplemented at peak periods by research collaborating students and consultants. This fragmentation reduces the efficiency, management and opportunities for the exchange of information.

ES&H PROJECTS:

Fire Safety Improvements, II (ANL)	5,350	5,350	1,215	1,500	2,411	224	0	1st Qtr FY 1994	1st Qtr FY 1997

This project will encompass fire protection system extensions, new installations, and system replacement in 80 existing ANL-E buildings. This phase will complete the upgrading of existing fire alarm and suppression systems and expand fire suppression systems.

1. Title and Location of Project: Multiprogram Energy Laboratories
Infrastructure Project
Various Locations

2a. Project No. MEL-001
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Fire Safety Improvements, III (ANL)	3,003	2,880	0	210	1,075	1,000	718	2nd Qtr FY 1996	4th Qtr FY 1998

This project encompasses the third phase of site wide fire safety modifications at ANL. This phase involves correction of "means of egress" deficiencies and fire separation/fire protection of building elements.

This project is proposed as part of ANL's 1991 Action Plan developed in response to ES&H findings and is required to correct existing fire and life safety deficiencies.

Sanitary System Mod. II (BNL)	4,250	3,772	0	960	1,690	1,032	568	1st Qtr FY 1996	4th Qtr FY 1998

This project is the second phase of the upgrade of the laboratory sanitary waste system. This project continues with replacement of the balance of defective sewer lines and implements treatment plant building improvements. This phase will include: replacement of approximately 15,440 linear feet of defective sewer pipe; and demolishing the Hyperchlorite Building (No. 576), the Barminator Building (No. 583), and the Influent Measuring Building (No, 584), which are plywood structures. These structures will be replaced with masonry structures. Service Building (No. 575), which is a lunch and spare parts trailer, will be replaced with a masonry addition.

The purpose of this project is to eliminate or minimize present and future infiltration to groundwater and exfiltration to the sewage collection system, to replace structures not presently meeting OSHA and NEC Codes.

1. Title and Location of Project: Multiprogram Energy Laboratories
Infrastructure Project
Various Locations

2a. Project No. MEL-001
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Loss Prevention Upgrades (BNL)	7,700	7,020	0	600	2,480	4,620	0	4th Qtr FY 1996	3rd Qtr FY 1998

This project provides for the upgrade of approximately 96 existing substations. With respect to fire protection, the project includes: relocating transformers; replacing oil-filled transformers with dry type; replacing oil-filled transformers with less flammable fluid; fire stand pipes and hose stations; fire deluge systems; dry chemical extinguishing systems; fire walls and barriers; wire glass; fire seals; relocating combustible materials and trailers; curbing; and oil retention pits. With respect to substation enclosures, work includes: extending existing fence to proper heights; new fence to replace deteriorating fence; new fence for relocated transformers; replacing fences at proper clearances; non-combustible door for vaults; panic hardware on vault doors; and protective screens. With respect to grounding, work includes: replacing deteriorating ground cable; new grounding for relocated substations; ground jumpers for gates; equipment grounds and reshaping arrestor grounding.

The purpose of this project is to minimize potential harmful situations to personnel and to minimize the potential loss of property and experimental program time due to fire. The sites' vulnerability was assessed as a result of ES&H findings.

Building Electrical Service Upgrade, I (ANL)	7,617	7,430	0	0	1,200	1,144	5,273	2nd Qtr FY 1997	4th Qtr FY 1999

This project will provide the most urgently needed replacement of emergency generators and the upgrade of building's main electrical services (circuit breaker retrofits, bus duct replacement and emergency generator replacements) that are no longer adequate, reliable, efficient, or in accordance with existing electrical codes/standards and environment, safety and health standards.

Failure to fund this project would increase frequency and duration of general maintenance resulting in increased parts and labor costs, negative impact on scientific programs and non-compliance with safety regulations.

1. Title and Location of Project: Multiprogram Energy Laboratories
Infrastructure Project
Various Locations

2a. Project No. MEL-001
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Hot Lab Renovation, Bldg 801 (BNL)	7,080	6,370	0	0	800	6,280	0	2nd Qtr FY 1997	4th Qtr FY 1998

This project, in the west side of Building 801 (the Hot Lab), is part of a comprehensive effort to: upgrade the production of radionuclides and radiopharmaceuticals for supply to the pharmaceutical/medical community outside the laboratory; upgrade major research program leading to new and more effective diagnostic and therapeutic agents; comply with DOE Order 5820.2A, which requires that the generation of low-level radioactive waste be reduced; and bring Brookhaven National Laboratory (BNL) into conformance with Federal, state, and local environmental laws and regulatory requirements. The unique location of BNL over an EPA designated "sole-source" aquifer has heightened regulatory concern over potential ground water contamination from BNL facilities.

Failure to fund this project would increase the potential for ground water contamination and non-compliance with safety regulations.

Roof Replacement Phase I (BNL)	2,873	2,873	2,773	100	0	0	0	4th Qtr FY 1993	4th Qtr FY 1995

This project supported roof replacement on buildings at BNL. Approximately 263,000 sq. ft. of re-roofing was accomplished during this phase.

Roof surveys conducted in 1989 have indicated that approximately 718,000 sq. ft. of roofing on 46 buildings will have to be replaced. This project represents Phase I.

1. Title and Location of Project: Multiprogram Energy Laboratories Infrastructure Project, Various Locations

2a. Project No. MEL-001
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Life Safety Code Compliance (PNNL)	1,970	1,970	1,464	506	0	0	0	1st Qtr FY 1994	4th Qtr FY 1995

This project supported upgrades to selected 300 area PNNL multiprogram facilities. These upgrades correct deficiencies in fire and life safety codes.

The project ensures continuity of operations in vital multiprogram laboratories at PNNL. The conditions of the buildings had raised many concerns about their adequacy for continuing operations. PNNL's research missions can be continued by completing the work proposed in this project.

Fire and Safety Systems Upgrade Phase I (LBNL)	4,600	4,600	1,470	2,000	1,130	0	0	2nd Qtr FY 1994	3rd Qtr FY 1997

This project is the first of several which will bring LBNL facilities into compliance with building, fire and life safety codes.

A majority of facilities at LBNL were constructed from the 1940s to the mid 1960s. The facilities provided national scientific leadership during a historically significant time. Since this period, major changes have occurred in building, fire and life safety codes. This project will support modifications required to meet new codes and correct noncompliance conditions.

1. Title and Location of Project: Multiprogram Energy Laboratories
Infrastructure Project
Various Locations

2a. Project No. MEL-001
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

	TEC	Prev.	Prior Year	FY 1995	FY 1996	FY 1997	Future Years	Start Date	End Date
Hazardous Materials Safeguards Phase I (LBNL)	4,720	4,720	1,470	1,962	1,288	0	0	3rd Qtr FY 1994	2nd Qtr FY 1996

Project scope modified due to reduction of hazardous materials stored in Building 70. Reduction achieved through use of off-site storage. Modifications include: deletion of chemical delivery system; ventilation system upgrades; and central monitoring and alarm system. This project will upgrade Building 70 to add safety, health and environmental protection safeguards to meet or exceed current standards for public health and safety.

The existing Building 70 is an aged laboratory facility used for materials sciences and semi-conductor research. These operations employ a wide variety of chemicals which are highly flammable and/or toxic. If this project is not supported, research operations must be restricted, resulting in curtailing or eliminating fields of research at LBNL.

Sanitary Sewer Restoration Phase I (LBNL)	2,400	2,400	0	0	2,400	0	0	3rd Qtr FY 1997	4th Qtr FY 1998

Portions of the underground sanitary sewer system will be replaced based upon video camera surveys of site sanitary sewer lines, including approximately 3,480 feet of sanitary sewer lines ranging in diameter from three (3) inches to eight (8) inches. Soil samples will be tested during construction for possible contamination. All excavated material that is contaminated will be either remediated or removed to an authorized hazardous waste site.

Failure to fund this project would increase the potential for ground water contamination, excessive maintenance costs, and non-compliance with safety regulations.

1. Title and Location of Project:	Multiprogram Energy Laboratories Infrastructure Project Various Locations	2a. Project No. MEL-001 2b. Construction Funded

9. Details of Cost Estimate

Based on preliminary or conceptual design.

10. Method of Performance

Design will be by negotiated architect-engineer contracts or laboratory personnel. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bids.

ENERGY RESEARCH-ENERGY SUPPLY PROGRAM DIRECTION

PROGRAM MISSION

This Program has been established in response to direction from the Congress that within each appropriation, each organization should have only one program direction decision unit for Federal staffing resources and related costs. Energy Research-Energy Supply Program Direction provides the Federal staffing resources and associated funding required to provide overall direction of activities carried out under the following programs: Biological and Environmental Research, Fusion Energy Sciences, Basic Energy Sciences, Computational and Technology Research, University and Science Education, Multiprogram Energy Laboratories-Facilities Support and Energy Research Analysis. This funding also provides the necessary support to the Director of Energy Research to carry out Energy Research (ER) responsibilities under the Department of Energy (DOE) Organization Act (P.L. 95-91) and as mandated by the Secretary. These responsibilities include providing advice on the status and priorities of the Department's overall research and development programs, on the management of the Department's multipurpose laboratories, and on its grants and education and training activities. They also include developing research and development plans and strategies and managing the Multiprogram Energy Laboratories-Facilities Support (MEL-FS) program. The program also supports staffing resources at the Chicago and Oakland Operations Offices directly involved in executing ER programs, as well as ER resources at the Federally-staffed Environmental Measurements Laboratory (EML). Program responsibility for the EML is being transferred from the Office of Energy Research to the Assistant Secretary for Environmental Management and Energy Research will close out its program activities at the Laboratory during FY 1997.

Program direction has been divided into five categories: salaries and benefits, travel, support services, Working Capital Fund and other related expenses. Support services refers to program direction funded support services contracts that provide necessary support functions to the Federal staff, such as technical support, computer systems development, training, and mailroom. Working Capital Fund costs include goods and services provided centrally by the Department at Headquarters. Other related expenses refers to other administrative costs of maintaining Federal staff, such as building and facility costs and utilities in the field and information technology expenses.

The goal of Energy Research-Energy Supply Program Direction is to fund the staff which are necessary to provide overall management direction of ER's scientific research programs funded in the Energy Supply Research and Development appropriation and to enable the Director of ER to serve as the Department's science advisor for formulation and implementation of basic research policy.

PROGRAM MISSION - ENERGY RESEARCH-ENERGY SUPPLY PROGRAM DIRECTION (Cont'd)

The objectives related to this goal are: to develop, direct and administer a complex and broadly diversified program of mission-oriented research, including the construction and operation of forefront scientific research facilities for use by the Nation's scientific community, and to conduct independent technical assessments, peer reviews and evaluations of specific programs and projects. The staff annually monitors and evaluates approximately 2,500 individual research projects at over 250 separate institutions and provides overall direction of research and development programs designed to support the development of new and improved energy, environmental and health technologies.

PERFORMANCE MEASURES

Responsiveness to national science policy and major science initiatives.

Improvement in environment, safety and health compliance.

Provision of new and enhanced research facilities and equipment.

Continued improvement in the utilization of staffing, travel and support contractor funds.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Energy Research continues to achieve technical excellence in its programs despite managing one of the largest, most diversified and most complex basic research portfolios in the Federal Government with a relatively small Federal and support contractor staff compared to similar programs.
- Increased productivity at U.S. scientific research facilities as part of the FY 1996 Scientific Facilities initiative.
- Reorientation of the fusion program consistent with available resources and Fusion Energy Advisory Committee advice.
- Nearing completion of the Advanced Photon Source on schedule and within budget. Operations to commence in FY 1997.
- Establishment of the Laboratory Operations Board to increase the efficiency and productivity of the DOE laboratory system.

PROGRAM MISSION - ENERGY RESEARCH-ENERGY SUPPLY PROGRAM DIRECTION (Cont'd)

- Implementation of the necessary and sufficient process for establishing standards for environment, safety and health protection following successful pilots at Fermilab and the National Tritium Labeling Facility. This process tailors environment, safety and health standards to the appropriate risks inherent in particular facilities and operations.
- Ensuring the science and technology parts of the National Energy Policy Plan are achieved.
- Complete the transition of program responsibility for the Environmental Measurements Laboratory from Energy Research to the Assistant Secretary for Environmental Management.

ENERGY RESEARCH-ENERGY SUPPLY PROGRAM DIRECTION

PROGRAM FUNDING PROFILE

(Dollars in thousands)

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Adjusted	FY 1997 Budget Request

ENERGY RESEARCH-ENERGY SUPPLY PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities:

Program Direction provides the Federal staffing resources and associated costs required to provide overall direction and execution of Office of Energy Research program and advisory responsibilities. Energy Research-Energy Supply Program Direction supports staff in the Basic Energy Sciences, Fusion Energy Sciences, Biological and Environmental Research, Computational and Technology Research, University and Science Education, Multiprogram Energy Laboratories-Facilities Support and Energy Research Analysis programs, including management and technical support staff. This program also supports staff at the Chicago and Oakland Operations Offices directly involved in program execution, as well as ER resources at the Environmental Measurements Laboratory. Staff includes scientific and technical personnel and program management support in the areas of budget and finance, general administration, grants and contracts, information resource management, policy review and coordination, infrastructure management and construction management.

In addition to the consolidation of all of the individual Energy Research-Energy Supply Program Direction accounts into one decision unit at the appropriation level, as directed by Congress, the FY 1997 request reflects two other major changes. Congress directed that all Federal salary costs be budgeted for in program direction accounts. Therefore, $3,600,000 is included in the FY 1997 budget request for Energy Research-supported staff at the Federally-staffed Environmental Measurements Laboratory (EML). Energy Research support for EML had previously been budgeted in Biological and Environmental Research program funds. FY 1997 represents the last year of ER funding for EML, since program responsibility for the Laboratory is being transferred from Energy Research to the Assistant Secretary for Environmental Management. In addition, beginning in FY 1997, program organizations are contributing to a Working Capital Fund to cover the costs of centrally provided goods and services, such as supplies, housing, utilities, etc., which previously were budgeted in Departmental Administration. $4,554,000 has been included in the FY 1997 request for Energy Research-Energy Supply Program Direction for the Working Capital Fund. Appropriate amounts have been included in the FY 1995 and FY 1996 Comparable Appropriation columns to reflect the above changes.

II. Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request

II. **Funding Table (Cont'd):**

	FY 1995 Comparable Appropriation		FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Total Energy Research						
Salary and Benefits	37,267		0	33,258	33,258	31,180
Travel	2,885	a/	0	1,946	1,946	1,865
Support Services	4,289	b/	0	2,724	2,724	2,574
Other Related Expenses	2,292		0	1,522	1,522	1,981
Working Capital Fund	4,234		0	4,254	4,254	4,554
Total	$50,967		$ 0	$43,704	$43,704	$42,154
Full Time Equivalents (FTEs)	422		0	340	340	310
Average FTE Costs	$ 121		$ 0	$ 128	$ 128	$ 136
Adjustment:	- 2,000	c/	0	0	0	0
Total Program Direction	48,967		0	43,704	43,704	42,154

a/ Includes $445,000 Rescission Reduction for Travel.
b/ Included $521,000 Rescission Reduction for Support Services.
c/ Share of Energy Supply Research and Development program direction general reduction for use of prior year balances.

III. Performance Summary

FY 1995 Accomplishments:

o Provided personnel compensation including salaries and personnel benefits, voluntary separation incentive payments, lump sum annual leave payments, travel, contractor support and other related expenses for 422 full-time equivalents in Energy Research-Energy Supply Program Direction.

966

III. Performance Summary (Cont'd)

- Staff provided overall direction and management of all of the Office of Energy Research's research and development programs funded in the Energy Supply Research and Development appropriation; also provided for the Director of Energy Research's responsibilities for advising the Secretary on science and technology issues and responding to requests for special analyses.

- Assessed the scientific and technical needs of the Energy Supply programs and prepared research and development plans to address them.

- Established priorities, developed funding strategies, evaluated and funded research proposals from laboratories, universities and industries, and monitored their progress.

- Managed and provided technical direction of over 1,400 individual research projects at over 200 separate institutions in the Basic Energy Sciences Program. The projects included research in materials sciences, chemical sciences, energy biosciences, geosciences, and engineering sciences. Monitored and evaluated the projects. Provided construction management and technical direction for the Advanced Photon Source project at Argonne National Laboratory. Supported the Basic Energy Sciences Advisory Committee.

- Managed research and development projects for mathematical and computational science. Managed technical direction of the ER supercomputer centers and Energy Science Network development activities. Managed the laboratory technology research and advanced energy projects programs. Managed the Department-wide Small Business Innovation Research and Small Business Technology Transfer programs.

- Managed and provided technical direction of 850 active research projects in the Biological and Environmental Research program including the appropriate competitive merit review of technical programs and selection of new activities. Continued central role in Federal activities supporting research that probes fundamental scientific issues in health and environmental research such as global climate change. Managed continuing efforts on health and environmental effects of radiation and toxic chemicals. Managed research to develop modern diagnostic and molecular therapy tools by combining the resources of structural, computational and molecular biology, nuclear medicine, and boron neutron capture therapy (BNCT). Supported the Health and Environmental Research Advisory Committee.

- The Fusion Energy Sciences staff supported materials and component development activities, and international collaboration on the International Thermonuclear Experimental Reactor design activities. Continued support of the Tokamak Physics Experiment project, Tokamak Fusion Test Reactor D-T experiments, and efforts to improve the tokamak concept and ensure continuing development of inertial fusion energy. Supported the Fusion Energy Advisory Committee.

III. Performance Summary (Cont'd)

- Provided the science and technology sections of the National Energy Policy Plan and the Department's Strategic Plan; conducted independent peer reviews of 300 projects in Energy Research, Fossil Energy, and Energy Efficiency to determine the quality of the science and its relevance to DOE's missions and the National science agenda; served as principal liaison with other Government science agencies and represented Energy Research and the Department on interagency coordinating councils.

- Managed uniform DOE-wide processes for continuous improvement of programs for research and development planning, laboratory-directed research and development, work-for-others and laboratory appraisals.

- Supported new performance-based contracts for DOE laboratories, developed infrastructure related performance measures and established criteria for determining the most urgent projects, and reviewed and implemented nuclear safety requirements contained in the Price Anderson Amendment Act of 1988. Managed the Multiprogram Energy Laboratory-Facilities Support program.

FY 1996 Accomplishments (to date and planned):

- Provide personnel compensation including salaries and benefits, voluntary separation incentive payments, lump sum annual leave payments, travel, contractor support and other related expenses for 340 full-time equivalents in Energy Research-Energy Supply Program Direction.

- Provide overall direction and management of all of the Office of Energy Research's research and development programs funded in the Energy Supply Research and Development appropriation; also provide for the Director of Energy Research's responsibilities for advising the Secretary on science and technology issues and responding to requests for special analyses.

- Assess the scientific and technical needs of the Energy Supply programs and prepare research and development plans to address them.

- Establish priorities, develop funding strategies, evaluate and fund research proposals from laboratories, universities and industry, and monitor their progress.

- Manage and provide technical direction of the highly diversified research and development activities of the Basic Energy Sciences Program; direct conceptual design activities for a spallation neutron source and continue construction and preparation for operation of the Advance Photon Source; continue to support the Basic Energy Sciences Advisory Committee.

- Continue to manage the Department's Small Business Innovation Research and Small Business Technology Transfer programs.

III. Performance Summary (Cont'd)

- Continue to support the interagency National Science and Technology Council high performance computing and communications program, ER supercomputer centers, and research and development projects for mathematical and computational science.

- Continue to manage and provide technical direction of research projects in the Biological and Environmental Research Program including the appropriate competitive merit review and selection of new projects and continue support of the Health and Environmental Research Advisory Committee.

- Continue construction management and research planning for the Environmental Molecular Sciences Laboratory at PNNL and the Human Genome Laboratory at LBNL. Complete construction and commence operations at the Structural Biology Centers at ANL and LBNL.

- Transition program responsibility for the Environmental Measurements Laboratory from Energy Research to the Assistant Secretary for Environmental Management.

- Restructure the fusion program from a technology-based to a science-based program in response to budget reductions and Fusion Energy Advisory Committee recommendations. Continue to support various fusion materials and component development activities including design and research and development tasks for the International Thermonuclear Experimental Reactor; expand the focus on international collaboration on fusion activities; continue support of the Fusion Energy Advisory Committee. Manage facility operations and research at D-III-D and Alcator C-Mod facilities consistent with the revised fusion program mission.

- Continue to represent Energy Research and the Department in high level interagency fora, such as the National Science and Technology Council, and to serve as principal liaison with other Government science agencies and other science organizations.

- Continue to manage a uniform DOE-wide process for improvement of programs for research and development planning, laboratory-directed research and development, and work-for-others and a laboratory appraisal process that measures progress in these areas.

- Continue management of the MEL-FS program; continue the development of infrastructure related performance measures; monitor progress towards goals related to these performance measures and implement criteria for determining the most urgent projects.

- Assume management of science education programs in response to direction from Congress.

666

III. Performance Summary (Cont'd)

FY 1997 Planned Accomplishments:

- Provide personnel compensation including salaries and benefits, voluntary separation incentive payments, lump sum annual leave payments, travel, contractor support and other related expenses for 310 full-time equivalents in Energy Research-Energy Supply Program Direction.
- Provide overall direction and management of all of the Office of Energy Research's research and development programs funded in the Energy Supply Research and Development appropriation; also provide for the Director of Energy Research's responsibilities for advising the Secretary on science and technology issues and responding to requests for special analyses.
- Assess the scientific and technical needs of the Energy Supply programs and prepare research and development plans to address them.
- Continue to establish priorities, develop funding strategies, evaluate and fund research proposals from laboratories, universities and industry, and monitor progress.
- Continue to provide program direction and oversight of efforts to meet National research goals supporting the Nation's energy-related technology foundation and support the Basic Energy Sciences Advisory Committee.
- Continue to manage and provide technical direction for all Basic Energy Science Program activities with increased emphasis on science for sustainable development; support increased operating time at the program's scientific research facilities and ensure their safe, healthy and environmentally sound operation.
- Direct completion of conceptual design activities for a spallation neutron source.
- Continue to support the interagency National Science and Technology Council high performance computing and communications program, ER supercomputer centers, and research and development projects for mathematical and computational science.
- Manage the Small Business Innovation Research program for the Department.
- Continue to manage and provide technical direction for all Biological and Environmental Research projects, including competitive merit review and selection of new projects and continue support of the Health and Environmental Research Advisory Committee.

1000

III. Performance Summary (Cont'd)

- Manage establishment of a third Atmospheric Radiation Measurement (ARM) site and coordinate complementary research activities across ARM sites with interagency partners.

- Continue construction management and research planning for the Environmental Molecular Sciences Laboratory at PNNL and the Human Genome Laboratory at LBNL.

- Complete the closeout of ER activities at the Environmental Measurements Laboratory as a result of transfer of program responsibility for the Laboratory to the Assistant Secretary for Environmental Management.

- Continue the transition to a fusion energy sciences program in response to the Fusion Energy Advisory Committee recommendations.

- Continue the emphasis on planning with foreign partners for a comprehensive fusion energy sciences program with particular emphasis on the International Thermonuclear Experimental Reactor; continue support of the Fusion Energy Advisory Committee.

- Manage a process for continuous improvement for research and development planning in the Department in coordination with other Federal agencies and in support of National science goals.

- Continue management of the Multiprogram Energy Laboratory-Facilities Support program with a focus on the most urgent projects as demonstrated by application of infrastructure related performance measures.

- Manage the ER efforts in science education in support of ER programmatic goals.

IV. Explanation of Funding Change FY 1996 through FY 1997

- The decrease of $1,550,000 in FY 1997 is due primarily to decreases in Federal staff, travel and support services costs resulting from Energy Research's streamlining efforts. These decreases have been only partially offset by within grade and cost-of-living increases for remaining staff, and administrative costs associated with downsizing, and an increase in the Working Capital Fund.

1001

III. Performance Summary (Cont'd)

V. Explanation of Average FTE costs:

Variations in average FTE costs from office to office result from a number of factors. The average for Headquarters is considerably higher than the field, for example. The major reasons for the difference is the charge at Headquarters for the Working Capital Fund for centrally provided goods and services. In addition, Energy Research Headquarters staff is comprised primarily of senior level scientific program managers, many of whom independently manage and direct large research programs in particular scientific disciplines. There is generally a higher ratio of support to professional staff in the field than in Headquarters due to the nature of the program execution functions carried out in the field, as opposed to the policy, planning and program management functions provided at Headquarters. The difference between average FTE costs at Chicago and Oakland results from the fact that Oakland has only two ER-funded staff in this program direction account, both of whom are scientific/technical staff, while two-thirds of Chicago's staff in this account are at the Environmental Measurements Laboratory, which has a broad range of grade levels of scientific and support staff.

TECHNICAL INFORMATION MANAGEMENT PROGRAM

PROGRAM MISSION

This program provides services and operational support for the Technical Information Management Program, which provides direction and coordination in the management and dissemination of scientific and technical information resulting from Department of Energy research and development and environmental programs; provides worldwide energy scientific and technical information to the Department of Energy, United States (U.S.) industry, academia, and the public; and fulfills international and interagency scientific and technical information commitments in support of Departmental and U.S. obligations.

The Office of Scientific and Technical Information, which reports to the Associate Director for Resource Management in the Office of Energy Research, is responsible for providing coordination and direction for the Department's Technical Information Management Program and for maintaining a centralized base of support to assist Departmental elements in planning, developing, and implementing scientific and technical information activities.

The GOAL of the Technical Information Management Program is to:

(a) Assure that scientific and technical information resulting from the Department of Energy's programmatic efforts is effectively managed and easily accessible to U.S. industry, educators, and the public in forms that facilitate responsiveness to customer needs, and (b) leverage the domestic technical information collection to acquire foreign energy research results through multilateral and bilateral exchange agreements. This approach assures that scientific and technical information is effectively provided to individuals who need it, thus facilitating accomplishment of Departmental goals related to energy efficiency, energy supplies, environmental protection and restoration, science and engineering research and education, and national competitiveness.

The OBJECTIVES related to these goals are:

- Provide technical and operational support for the coordination of scientific and technical information policy, activities, and standards to support Department of Energy programmatic needs.
- Acquire and manage a base of Department of Energy scientific, technical, and environmental information and other domestic and international information needed by the Department and its customers.
- Ensure the broad dissemination of or access to energy-related information while protecting national security and promoting U.S. competitiveness.

- Maximize the value of scientific and technical information by providing specialized information management support and services to the Department of Energy community.

- Promote the transfer of technology to the U.S. commercial sector through information-sharing partnerships and access channels focused on globally competitive technologies.

PERFORMANCE MEASURES:

Performance measures for the Technical Information Management Program are both qualitative and quantitative. The quality of the program is measured by the Department-wide adoption and implementation of "best business practices" for managing scientific and technical information. This includes the use of standards and practices for ensuring that information is planned for, managed, shared, and disseminated in a way that minimizes duplication of programmatic effort. Quality is also measured by customer satisfaction (industry, academia, government) with information timeliness, accuracy, and comprehensiveness. Quantitative performance measures include:

- Percent of information collected and managed from the Department's multi-billion dollar annual research and development investment.

- Increase in public access to Department of Energy scientific and technical information.

- Percent and amount of foreign energy-related information acquired to augment the U.S. collection and promote national competitiveness.

- Number and usage levels of information access channels.

- Number of technical information management systems and tools developed for Department of Energy elements to evaluate and improve program performance.

- Amount of declassified or previously limited information made available to the public.

- Environment, safety, and health ratings of the Office of Scientific and Technical Information facility.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The Program has effectively captured and managed 95-98 percent of scientific and technical information resulting from the Department's multi-billion dollar research and development investment.

- The Program has developed new electronic access channels (e.g., DOE Home Page) to make the Department of Energy's information more readily available and easily accessible to the public. This is part of a long-term strategic shift from traditional media (paper, fiche) to electronic information sharing.

- Alliances have been established with other Departmental organizations to leverage resources and improve service and delivery of information to specific customers.
- The availability of worldwide energy-related scientific and technical information has been improved through international and interagency cooperation.
- The integration of scientific and technical information goals and objectives into the Department's activities has resulted in improved and more cost-effective information management and use within the Department.
- Partnerships with the Government Printing Office, Nuclear Regulatory Commission, and with international organizations have been strengthened to ensure broad availability of worldwide information to the U.S. public.
- Evaluation systems have been developed to measure Departmental performance in meeting customers' scientific and technical information needs.

PROGRAM PERFORMANCE SUMMARY

TECHNICAL INFORMATION MANAGEMENT PROGRAM

I. **Mission Supporting Goals and Objectives**

The Technical Information Management Program is a Department-wide approach to managing scientific and technical information resulting from a multi-billion dollar investment in energy supply research, weapons site cleanup, national security, and other energy-related technologies. The Program, directed and coordinated by the Office of Scientific and Technical Information, is implemented at many levels within the Department and by its contractors. The operational responsibilities of the Program include collecting, protecting, and disseminating appropriate Department of Energy information for the benefit of U.S. educational, industrial, and research communities. Operational activities also include the development and maintenance of systems and technologies to transition from traditional information media to electronic information exchange.

The operational activities listed below support the Program's goals and objectives. Specifically, the goals and objectives include:

- Establishing additional channels to Department of Energy information to expand the knowledge base in U.S. industrial, educational, and public communities.
- Developing information management models and coordinating "best business" information policies and practices to help Departmental elements track and evaluate their programs and to increase the return on the Department of Energy's research and development and environment-related investments.
- Acquiring and organizing international information on research and technology needed by U.S. communities.
- Continuing environment, safety, and health improvements in the Department's Office of Scientific and Technical Information facility for the protection of its historic and current technical information resources.

1010

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Operating Expenses	$ 5,115	$ 2,200	$ 2,300	$ 100	5%
Construction	1,000	1,000	1,000	0	0%
Subtotal	$ 6,115	$ 3,200	$ 3,300	$ 100	3%
Adjustment	(491) a/	(24) b/	-	24	-
Total, Technical Information Management Program	$ 5,624	$ 3,176	$ 3,300	$ 124	4%

a/ Share of Energy Supply Research and Development general reductions/use of prior year balances
b/ Reprogrammed to Indian Energy Resources Program

III. Performance Summary:

FY 1995 Accomplishments:

- Increased the number of technical information users served by 30 percent, reaching new customers through more easily accessible and readily available access channels.
- Developed three new electronic public access channels (CD-ROM and on Internet Home Page), significantly increasing the use of DOE information.
- Acquired and disseminated over 85,000 foreign energy-related research summaries for use by U.S. academic and industrial communities.
- Developed management information systems and decision and evaluation tools for Department of Energy program offices in the areas of nonproliferation, openness, national competitiveness (technology transfer), and environment, safety, and health.
- Completed design phase and first-year of a three-year construction project to remove all remaining asbestos from the Office of Scientific and Technical Information facility and upgrade the heating, ventilation, and air-conditioning system.

FY 1996 Accomplishments (to date and planned):

- Acquire 10-20 percent of Department of Energy scientific and technical information through Internet-based electronic exchange.
- Implement system to identify and share information on research, development, and demonstration projects, raising the awareness of ongoing efforts and reducing the likelihood of duplication.
- Complete 50 percent of a three-year project to remove asbestos and upgrade the heating, ventilation, and air-conditioning system at the Office of Scientific and Technical Information facility.

FY 1997 Planned Accomplishments:

- Implement electronic full-text information exchange as the primary means for processing, managing, and disseminating the Department's scientific and technical information.
- Collect, store, and manage scientific and technical information from downsized or consolidated Department of Energy technical facilities, ensuring future availability to scientists, engineers, and program managers.
- Initiate implementation of technology to provide "paperless" on-demand document management and delivery for scientific and technical information users.
- Establish mechanisms and management tools to effectively track and evaluate 100 percent of ongoing Department of Energy research and development activities to ensure nonduplication of effort.
- Achieve two-thirds completion of the asbestos removal and heating, ventilation, and air-conditioning system upgrade at the Office of Scientific and Technical Information facility.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

From FY 1996 to FY 1997, there is essentially no change in funding, but this follows a 47 percent funding reduction from FY 1995. In order to accommodate normal escalation and cost-of-living increases, contractor staffing has been and will be reduced.

The $204,000 increase from FY 1996 to FY 1997 represents funding that was originally in the FY 1996 budget but was cut as a result of continuing resolution impacts. In FY 1997, these funds will be applied to enhancing public access to information. The additional $100,000 increase is balanced by an equal reduction in program direction; Program-wide, there is no increase. The shift in funds is a modest effort to offset large cuts made in FY 1996 and will allow operational elements to accommodate basic escalation costs. As a result of the significant FY 1996 reduction, FY 1997 programmatic goals are impacted in the following ways:

- Further reductions in the timeliness, quality, or amount of worldwide information available to U.S. communities.

- Slower transition from a centralized, traditional media-based environment to a decentralized electronic environment.
- Significant difficulty in filling the federal research community's and the private sector's need and readiness for electronic, easily accessible information.
- One-year delay in the completion of the construction project for asbestos removal and heating, ventilation, and air-conditioning system upgrade.

CONSTRUCTION PROJECT DATA SHEET

TECHNICAL INFORMATION MANAGEMENT PROGRAM

Office of Scientific
and Technical Information (OSTI)

Program 39 LA

(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and location of project: Heating, Ventilation and Air Condition (HVAC) Retrofits of OSTI Facility, Oak Ridge, Tennessee

2. Project No: 95-A-500

3. Date A-E work initiated: 1st Quarter FY 1995

5. Previous Cost Estimate: $3,800
Date: June 1992

3a. Date physical construction starts: 1st Quarter FY 1995 (Asbestos abatement design and review started in 1st quarter FY 1995. Actual revmoval begins in 2nd Quarter FY 1996. Renovation of HVAC will begin in FY 1997 following engineering design and award of contract. Original timetable for completion has been extended by one year due to funding shortfalls in FY 1996 and FY 1997).

6. Current Cost Estimate: $4,000
Date: September 1993

4. Date construction ends: 3rd Quarter FY 1998

7. Financial Schedule:

Fiscal Year	Authorizations	Appropriations	Obligations	Costs
1995 (actual)	$4,000	$1,000	$ 980	$ 270
1996	0	1,000	1,020	1,730
1997	0	1,000	1,000	1,000
1998	0	1,000	1,000	1,000
	$4,000	$4,000	$4,000	$4,000

8. Project Description, Justification, and Scope:

This project will update and renovate the HVAC systems of the Office of Scientific and Technical Information facility in Oak Ridge, Tennessee. The facility is a single level facility with 132,000 square feet. Proposed changes to the HVAC system include the following: addition of a new chiller (FY 1997), addition of new chilled water distribution system (FY 1997), upgrade of the existing chiller to use a non-ozone-depleting refrigerant (FY 1997), replacement of air conditioning units which are at the end of their useful life (FY 1997), rework of the air distribution system for several of the air conditioning units (FY 1998), replacement of deteriorated air distribution system insulation (FY 1998), and removal of friable asbestos (FY 1996) and asbestos that is associated with HVAC renovations (FY 1996).

1. Title and location of project: Heating, Ventilation and Air Condition (HVAC) Retrofits of OSTI Facility, Oak Ridge, Tennessee

2. Project No.: 95-A-500

The OSTI facility is approximately 40 years old. It was originally constructed for warehouse purposes, and in the early 1950s it was renovated to include office and production areas and now houses over 220 DOE and DOE contractor employees. In the FY 1990 and FY 1991 timeframe under another construction project, the facility's roof, archival area, electrical system, and security area were upgraded. This project also provided for the replacement of the cooling tower and some asbestos removal.

Due to the age of the facility, many heating, ventilating and air conditioning (HVAC) systems in the building are over or near the end of their useful life. Due to OSTI's expanded mission, many HVAC systems are overloaded and do not meet the building's operational needs. These antiquated HVAC systems require continual maintenance and pose a threat to the invaluable archived material for which OSTI is responsible and to the uninterrupted operation of the computer room, which is central to OSTI's operations. Finally, asbestos is located in several areas above the ceiling. The presence of asbestos is causing personnel and operational problems which need to be eliminated for personnel safety and for ease in maintenance operations.

The work under this project would contribute significantly toward extending the life of the facility to 20 years, enhancing OSTI's ability to perform its continually expanding mission, assuring uninterrupted operation of OSTI's production equipment, and improving personnel safety.

9. Details of Cost Estimate

	Total Cost
a. Engineering, design, and inspection at approximately 12.5 percent of construction costs, item b	$ 335
b. Construction costs	3,145
c. Contingency at approximately 16 percent of above costs	520
Total project costs	$4,000

10. Method of Performance

Titles I, II and III engineering will be accomplished by a prime A/E contractor. Construction and procurement will be accomplished by the Oak Ridge on-site construction management contractor (MK Ferguson) utilizing fixed price subcontracts selected on the basis of competitive bidding.

1017

1. Title and location of project: Heating, Ventilation and Air Condition (HVAC) Retrofits of OSTI Facility, Oak Ridge, Tennessee

2. Project No.: 95-A-500

11. Funding Schedule of Project Funding and Other Related Funding Requirements:

	Prior Years	FY 1995 (Actual)	FY 1996	FY 1997	FY 1998	Total
a. Total project funding						
(1) Total facility costs						
(a) Construction and line item	0	$ 270	$1,730	$1,000	$1,000	$4,000
(b) PE&D	0	0	0	0	0	0
(c) Expense funded equipment	0	0	0	0	0	0
(d) Inventories	0	0	0	0	0	0
Total facility costs	0	$ 270	$1,730	$1,000	$1,000	$4,000
(2) Other project funding						
(a) R&D necessary to complete construction	0	0	0	0	0	0
(b) Other project related costs	0	0	0	0	0	0
Total project funding	0	$ 270	$1,730	$1,000	$1,000	$4,000

b. Total related funding requirements	
(1) Facility operating costs	0
(2) Programmatic operating expenses directly related to the facility	0
(3) Capital equipment not related to construction but related to the programmatic effort in the facility	0
(4) GPP or other construction related to programmatic effort in the facility	0
(5) Other costs	0
Total other related annual costs	0

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

(None)

13. Incorporation of Fallout Shelters in Future Federal Buildings

This project does not include the construction of new buildings; therefore, the provision for fallout shelters is not applicable.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ENERGY SUPPLY, RESEARCH AND DEVELOPMENT
FIELD OPERATIONS

EXECUTIVE BUDGET SUMMARY

Mission:
The Office of the Associate Deputy Secretary for Field Management (Field Management) provides managerial oversight of the eight Operations Offices, and the Ohio and Rocky Flats Field Offices. It also provides management and oversight of the Department's life cycle capital asset program which includes project management, real property management, utilities, maintenance and facilities efforts.

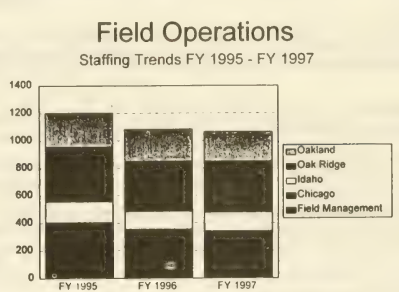
Field Management is also the lead Office for a number of Departmental initiatives including Strategic Alignment, contract reform, and consolidation of contractor oversight activities performed by Headquarters organizations.

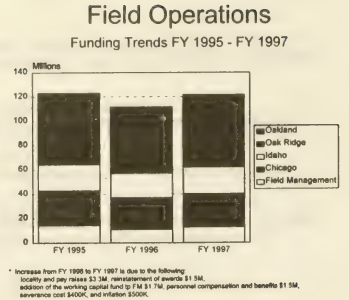
Additionally, Field Management has responsibility for those portions of the Chicago, Idaho, Oakland and Oak Ridge Operations Offices manpower and administration activities previously funded within the Department's Departmental Administration account.

Strategy:
Field Management serves as a change agent, implementing and institutionalizing Administration and Departmental initiatives, most notably Strategic Alignment, performance based management, contract reform, decentralization and empowerment, to bring about a customer-orientated, cost conscious organizations in both the Headquarters and the field.

Major Changes:
The activities funded within this account were previously funded within the Departmental Administration account. This move provides for a more focused resource management of the four multi-purpose field Operations Offices. It distinguishes Headquarters staff activities from field operations activities for improved management and oversight of Departmental operations.

Site Funding and Federal Staffing Targets: (cont'd)





* Increase from FY 1996 to FY 1997 is due to the following: locality and pay raises $3.3M; reinstatement of awards $1.5M; addition of the working capital fund to FM $1.7M; personnel compensation and benefits $1.5M; severance cost $400K; and inflation $500K.

1020

FIELD OPERATIONS

PROGRAM MISSION

The Office of the Associate Deputy Secretary for Field Management (Field Management) provides managerial oversight of the eight Operations Offices and the Ohio and Rocky Flats Field Offices. It also provides management and oversight of the Department's life cycle capital asset program which includes project management, real property management, utilities, maintenance and facilities efforts.

Field Management is also the lead Office for a number of Departmental initiatives including Strategic Alignment, contract reform, and consolidation of contractor oversight activities performed by Headquarters organizations.

Additionally, Field Management has responsibility for those portions of the Chicago, Idaho, Oakland and Oak Ridge Operations Offices manpower and administration activities previously funded within the Department's Departmental Administration account.

The GOAL of Field Management's mission is to serve as a change agent within the Department to advance and institutionalize the Department's commitment to customer service and cost effectiveness while providing continuous improvement in technical and managerial discipline to effectively carry out the Department's programmatic mission.

The OBJECTIVES related to this mission are:

1. MANAGING AND COORDINATING THE DEPARTMENT'S STRATEGIC ALIGNMENT INITIATIVE: Meet the end-of-year employment goals, maintain diversity during the Department's right sizing initiative and meet or exceed the Secretary's supervisor to employee ratio goal.

2. MANAGEMENT PRACTICES: Develop and maintain Departmental management and facilities policies, systems and studies. Be the leader in developing and implementing innovative systems and standards for contractor selection, negotiation and administration with particular emphasis on performance-based contracts. Improve the accuracy of the Department's project management and life cycle asset management systems and procedures through a hierarchy of requirements, training and assurance of clear guidance.

3. ENVIRONMENT, SAFETY AND HEALTH: For the Operations Offices, achieve cost effective ES&H excellence oriented towards environmentally sound and safe workplace management practices at all facilities.

FIELD OPERATIONS

PROGRAM MISSION

PERFORMANCE MEASURES:

1. MANAGING AND COORDINATING THE DEPARTMENT'S STRATEGIC ALIGNMENT INITIATIVE (SAI):
   A. Meet or exceed SAI staffing targets for FY 1997.
   B. Increase the supervisor to employee ratio of 1 to 12.
   C. Advance diversity education and maintain the workforce profile.
   D. Reduce travel and support services to meet or exceed SAI targets across the organization.

2. MANAGEMENT PRACTICES:
   A. Streamline project management proce dure and processes.
   B. Improve acquisition and project management skills across the complex via certification training and improved systems.
   C. Increase Performance-Based Management contracting for laboratory and M&O contractors.
   D. Increase fixed price and incentive contracts for well defines and no time procurement across the organization.
   E. Improve corporate and local systems for baseling, monitoring, business management and reporting across the Department.
   F. Implement an executive management system prototype at the field level.
   G. Develop standard cross cut management information systems.
   H. Implement instruction models for program management, asset management and budget deployment via the Internet.
   I. Consolidation of Headquarters oversight of field activities.

3. ENVIRONMENT, SAFETY AND HEALTH:
   A. Reduce ES&H risk across the organization through increased compliance reviews and accomplishments compliance actions.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The Office of Contractor Employee Protection has been transferred from the Office of Field Management to the Office of the Inspector General in accordance with Congressional direction and the recommendation of the Strategic Alignment Initiative in FY 1996.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS: (cont'd)

- Created a corporate facilities "cradle to grave" approach for the management of the Department's acquisition, maintenance and decommission by implementing new Life Cycle Asset Management directives..
- The Chicago Operations Office and the University of Chicago completed negotiations and executed the first performance-based management and operating contract for operation of a major DOE laboratory by a not-for-profit organization.
- The Idaho Operations Office Organizational Streamlining Plan has increased its percentage of technical/professional to other skill mix from 38.3% in 1990 to 56% in 1995. Also a matrix organization has created a 17:1 employee to supervisor ratio surpassing the DOE goal of 10:1.
- The Oak Ridge Operations Office has completed the consolidation of financial databases and payment processes for the Financial Center of Excellence.
- The Chicago Operations Office examined and streamlined the process for National Environmental Policy Act (NEPA) documentation based on Total Quality Management and continuous improvement, replacing a cumbersome, time-consuming, manpower intensive process. The new process will result in a 10-fold reduction in cycle time, a 5-fold reduction in cost, and increased responsiveness to project schedule.
- The Oakland Operations Office has radically exceeded the goals set forth in the FY 1995 budget by, administering 1,310 contracts and grants, performing 176 contract and grant closeouts and performing 49 ES&H reviews.

CHICAGO OPERATIONS OFFICE

PROGRAM MISSION

The Chicago Operations Office (CH) is a technical and business management team whose purpose is to advance the Department of Energy's (DOE) Mission and core values through administering and managing programs, projects, facilities, and contracts. CH is responsible for integrated management of energy laboratories and facilities as well as execution of DOE programs and projects in the field. The office performs a broad range of functions in support of research and technology development activities at its various contractor sites. These management functions include: field procurement and contract administration (over 2,300 contractual and financial assistance instruments); environmental restoration and waste management; environmental, safety and health monitoring; property management; labor relations; personnel; and financial management. CH prepares and administers budgets and maintains both technical and an administrative staff to support ongoing programs and projects for Energy Research and several other DOE Program Offices. In addition, CH has cognizance of over 12,000 contractor employees located at various site offices, national laboratories, and other facilities under its purview. The budget supports Federal staff required to carry out these crosscutting administrative and technical oversight responsibilities, which are applicable to a broad range of DOE programs.

CH program oversight responsibilities include: High Energy Physics; Fusion Energy R&D and related test facilities; Basic Energy Sciences; Biological and Environmental Research; the Reactor Safety and Technology programs; Security Affairs; Environment, Safety and Health; Decontamination and Decommissioning and other Environmental Restoration and Waste Management efforts; Energy Efficiency and Renewable Energy and Cogeneration Technology projects; technology utilization; university construction grant programs; and work for others.

CH administers and manages the multi-program laboratories Argonne National Laboratory-East (ANL) and Brookhaven National Laboratory (BNL) and single purpose facilities - Ames Laboratory at Iowa State University, MIT's Bates Linear Accelerator Center, Fermi National Accelerator Laboratory (FERMILAB), Michigan State University's Plant Research Laboratory, Notre Dame Radiation Laboratory, and Princeton Plasma Physics Laboratory (PPPL); and Government-owned Government-operated Laboratories Environmental Measurements Laboratory (EML) and New Brunswick Laboratory (NBL).

GOALS AND OBJECTIVES

- Be the leader in developing and using innovative systems and standards for contractor selection, negotiation, and management, with particular emphasis on performance-based contracting.
- Achieve results-oriented, cost-effective, environmentally sound, and safe workplace management practices at all facilities.
- Pursue new initiatives to advance the Department's missions in science and technology.
- Establish a regionally-based R&D Technology Management program by collaborating with contractors, end users, grantees, industrial partners, universities, and state and local government.

PERFORMANCE MEASURES:

- Convert the remaining three Laboratory Management and Operating contracts to performance based contracts. As in the two Management and Operating contracts already converted, the contracts will contain approximately 60 performance measures for the operational, areas including incentives to utilize fixed price subcontracts.
- Continue to utilize fixed price prime and other-incentive type contracts as has already been accomplished with the protective services and information processing support services contracts.
- Streamline our project management procedures and processes.

Environmental Safety & Health

- The time required to prepare Environmental Assessments has been reduced by NEPA contracting reform. Performance on cost reduction has not been measured at this point, however, data is currently being collected.

Financial

- Improve systems for baselining, monitoring, reporting and validating contractor cost savings resulting from conversion of M&O contractors to Performance Based Management contracts.
- Improve financial oversight of M&O contractors identifying opportunities for cost reductions.

SIGNIFICANT ACCOMPLISHMENTS:

- In line with the National Performance Review and the DOE Strategic Alignment Initiative, CH has realigned its operations to: improve line management performance; enable one-stop shopping for customers; increase technical assistance; streamline oversight; eliminate micro management/reduce layers and accommodate employee empowerment and accountability.

- CH and the University of Chicago completed negotiations and executed the first performance-based management and operating contract for operation of a major DOE laboratory by a not-for-profit organization. The new Argonne National Laboratory contract incorporates key objectives of DOE's Contract Reform Initiative including: a fully incentivized performance fee contractor; assumption of increased risk associated with financial liabilities; performance-based management; and agreed upon cost reductions. The new contract is-projected to save approximately $77 million savings through September 30, 1999.

- CH also concluded negotiations and executed a new performance based contract with Associated Universities, Inc. on August 21, 1995 for operation of Brookhaven National Laboratory. CH expects this new agreement to save $69 million over the next 5 years.

- 1,200 CH grantees received expedited payment due to a streamlined DOE/Health and Human Services cooperative payment management system. CH's process completely eliminates manual processing.

- In the past year, CH has reduced receivables over 90 days with the implementation of a deposits data base and automated receivables follow-up letters.

- CH continued a Quality Initiative that resulted in cost savings initiatives, streamlined processes, and teaming efforts enabling CH's internal realignment, consistent with Departmental realignment and the National Performance Review.

- CH examined and streamlined the process for National Environmental Policy Act (NEPA) documentation based on Total Quality Management and continuous improvement, replacing a cumbersome, time-consuming, manpower intensive process. The new process will result in a 10-fold reduction in processing time, a 5-fold reduction in cost, and increased responsiveness to project schedules.

- Chicago has proudly overseen contractor operations which have made significant contributions to science and technology during the past year:
  Recently, physicists at Fermi National Accelerator Laboratory announced the discovery of the top quark, the last undiscovered quark of the six predicted to exist by current scientific theory. The discovery provides strong support for the "Standard Model" of the structure of matter.

  Researchers at Brookhaven National Laboratory's Brookhaven Medical Reactor, in cooperation with doctors from Beth Israel Hospital, have provided Boron Neutron Capture Therapy to six patients with glioblastoma, a rare form of brain cancer.

  Princeton Plasma Physics Laboratory's Tokamak Fusion Test Reactor produced a world record 10.7 million watts of controlled fusion power during the world's first experiments utilizing a 50/50 mix of deuterium and tritium.

CHICAGO OPERATIONS OFFICE

I. Mission Supporting Goals and Objectives:

Goals and objectives include providing the support necessary to all Departmental missions in the most cost effective and efficient manner. This includes not only the routine support activities necessary to sustain these missions, but also priority initiatives such as Defense Nuclear Facilities Safety Board (DNFSB) activities, Chief Financial Officer initiatives, task order contracting and contract reform, technology transfer activities, safeguards and security and emergency preparedness activities and the promotion of the safety and health of employees and the Public.

II. Funding Schedule:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Total, Chicago Operations Office	$ 28,170	$ 26,110	$ 27,277	1,167	4

1029

III. Performance Summary: CHICAGO OPERATIONS OFFICE

FY 1995 Accomplishments:

- In line with the National Performance Review and the DOE realignment initiative, the Chicago Operations Office (CH) has realigned its operations to: improve line management performance; enable one-stop shopping for customers; increase technical assistance; streamline oversight; eliminate micromanagement/reduce layers and accommodate employee empowerment and accountability.

- CH and the University of Chicago completed negotiations and executed the first performance-based management and operating contract for operation of a major DOE laboratory by a not-for-profit organization. The new Argonne National Laboratory contract incorporates key objectives of DOE's Contract Reform Initiative including: a fully incentivized performance fee; assumption of increased risk associated with financial liabilities; performance-based management; and agreed upon cost reductions. The new contract is projected to save approximately $77 million savings through September 30, 1999.

FY 1995 Accomplishments: (cont'd)

- CH also concluded negotiations and executed a new performance-based contract with Associated Universities, Inc. on August 21, 1995 for operation of Brookhaven National Laboratory. CH expects this new agreement to save $69 million over the next 5 years.

- 1,200 CH grantees received expedited payment due to a streamlined DOE/Health and Human Services cooperative payment management system. CH's process completely eliminates manual processing.

- In the past year, CH has reduced receivables over 90 days with the implementation of a deposits data base and automated receivables follow-up letters.

- CH continued a Quality Initiative that resulted in cost savings initiatives, streamlined processes, and teaming efforts enabling CH's internal realignment, consistent with Departmental realignment and the National Performance Review

- CH examined and streamlined the process for National Environmental Policy Act (NEPA) documentation based on Total Quality Management and continuous improvement, replacing a cumbersome, time-consuming, manpower intensive process. The new process will result in a 10-fold reduction in cycle time, a 5-fold reduction in cost, and increased responsiveness to protect schedules.

FY 1996 Accomplishments (to date and planned):

- Execute the first year of a five year performance-based management and operating contracts with Argonne National Laboratory and Brookhaven National Laboratory.

- CH will conclude performance based management contract negotiations with Princeton Plasma Physics Laboratory and Fermi National Accelerator Laboratory.

- 1,200 CH grantees will continue to receive expedited payments due to a streamlined DOE/Health and Human Services cooperative payment management system.

- Oversee the commissioning and start of operations of the Department's Advanced Photon Source.

- Continue to administer the Department's RHIC (Relativistic Heavy Ion Collider) and the FMI (Fermi Main Injector) projects to maintain cost/schedule performance.

FY 1996 Accomplishments: (con't)

- Continue to increase the ratio of employee to supervisors from the FY 1995 baseline of 11:1.
- Transition the first phase of certain accounting functions for payments, travel, and receivables to the Department's consolidated accounting sites.

FY 1997 Planned Accomplishments:

- Continue to administer the Department's RHIC (Relativistic Heavy Ion Collider) and the FMI (Fermi Main Injector) projects to maintain cost/schedule performance.
- Continue to execute the CH laboratory's performance-based management and operating contracts.
- Continue the phased transfer of accounting functions for payments, travel, and receivables to the Department's consolidated accounting sites.
- Continue to increase the ratio of employees to supervisors from the FY 1995 baseline of 11:1.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $1,167,000 is due to the reinstatement of awards ($465,000), the FY 1996 and FY 1997 locality pay increase and pay raise ($547,000), and increase in benefits commensurate with salary adjustments ($156,000).

FIELD MANAGEMENT

PROGRAM MISSION

The Office of Field Management provides direction, policy, management and coordination to the eight Operations Offices and the Ohio and Rocky Flats Field Offices. This includes, strategic planning, review of resource allocation, infrastructure requirements, and general oversight responsibilities.

GOALS AND OBJECTIVES

1. The goals of the Office of Field Management are to:

- Facilitate implementation of Environment, Safety and Health initiatives.
- Ensure that Field Management, in its role as liaison between the field and program offices not only communicates field policy, but acts as an advocate for these parties.
- Improve communication and trust within the Department of Energy.
- Develop and provide Departmental Life Cycle Asset Management policy, systems and standards. Provide a variety of technical and operational services including real property acquisition, utilities expertise and property disposal.

PROGRAM OBJECTIVES

- Manage and coordinate the Department's Strategic Alignment Initiative effort.
- Develop and maintain Departmental management and facilities maintenance policies, systems and standards.
- Review Daily Operations Briefs and communicate the findings to the potentially affected field offices and work with the field and program offices to identify the root cause of problems.
- Provide assistance to field and program offices in developing and enhancing performance measurements systems through trend analysis of construction project performance indicators.
- Assure Field Offices have sufficient resources to carry out their assigned responsibilities.
- Institutionalize Contract Reform within the Department.
- Improve the accuracy of the Department's construction project cost and schedule estimates through a hierarchy of requirements, training and issuance of clear guidance.
- Provide assistance and support to the Field Offices to aid their transformation due to the Department's Alignment efforts.
- Provide support to the Field Offices in maintaining diversity.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Created a "cradle to grave" approach for the management of the Department's acquisition, maintenance, and decommission by implementing new Life Cycle Asset Management directives.
- Developed and implemented the Secretary's Comprehensive Land Use Policy which includes the economic, ecological, social and cultural factors in site planning.
- Transferred the Office of Contractor Employee Protection to the Office of Inspector General in accordance with Congressional direction and the recommendation of the Strategic Alignment Initiative in FY 1996.

1034

FIELD MANAGEMENT

I. Mission Supporting Goals and Objectives:

The goals of the Office of Field Management include facilitating implementation of Environment, Safety and Health initiatives; ensuring that Field Management, in its role as liaison to field and program offices not only communicates as communicators of field policy, but as conduits and advocates of both customers; improve communication and trust within the Department of Energy's complex among the field and program offices; develop and provide Departmental Life Cycle Asset Management policy systems and standards; and provide a variety of technical and operational services including real estate, utilities expertise and property disposal.

II. Funding Schedule:

Activity	FY 1995	FY 1996	FY 1997	$Change	% Change
Total, Field Management	$ 16,310	$ 12,096	$ 12,802	706	6

1035

III.

Performance Summary: FIELD MANAGEMENT

FY 1995 Accomplishments:

- Initiated two pilot programs to reduce burdensome oversight of the Field Offices, contractors, and National Laboratories by Headquarter elements as cited in the Galvin report to the Secretary.

- Eliminated thirteen Department of Energy orders and replaced them with the Life Cycle Asset Management Directive, saving an estimated $51 million annually.

FY 1995 Accomplishments: (Cont'd)

- Developed in partnership with the Office of Environment Management, the Surplus Facility Transfer Order establishing the policy for the orderly transition of contaminated facilities from operating organizations to Environment Management and Waste Management.
- Allocated Strategic Alignment Initiative staffing reductions for field activities through a consensus process.
- Provided contractor employee protection services in 35 new cases received since 1993.
- Completed a special assessment of the Superconducting Super Collider project to determine critical cost risk areas, leading to an informed, cost effective, efficient termination of the project.
- Saved an estimated $19.8 million annually through the competitive procurement of electric power at the Nevada Test Site ($1.4m), the privatization of the Savannah River D-Area Powerhouse ($10m) and managed the competitive acquisition of natural gas at 17 Department sites ($8.4m).
- Avoided cost of an estimated $176 million through the coordination of corporate practices for value-engineering and the participation in eight utility rate interventions for Department sites.

FY 1996 Accomplishments (to date and planned):

- Assist in developing a corporate system to integrate policy/financial and project management systems in support of the Annual Performance Plan.
- Further integrate the strategic planning, project and budget process, assisting in the development of a comprehensive management system.
- Further empower the Operation Offices to conduct additional Energy System Acquisition Advisory actions.

1036

FY 1996 Accomplisments: (Cont'd)

- Implement a Comprehensive Landlord Integrated Facilities Planning Process with an emphasis on site strategic planning and budgeting for the Department.

- Lead Departmental initiatives to improve and reduce field office and contractor oversight along with other contract reform issues and collect performance measurements for reform pilots in place; lead efforts to institutionalize.

- Implement Life Cycle Asset Management Directives for the acquisition, management operations, and disposal of the Department's infrastructure assets and obtain performance measurements for the Department's Annual Performance Plan. This will include the merging of two offices into a single unit, increasing productivity and customer service.

- Implement an orderly execution of Strategic Alignment Initiative milestone and staffing targets.

- Through participation in the Executive Resource Board, manage the reallocation of Senior Executive Service positions in the field.

- Achieve cost avoidances through utility rate case interventions, and utility acquisition planning and management.

FY 1997 Planned Accomplishments:

- Further delegate management authority using participatory and consensus based systems for infrastructure assets, including Major System Acquisition and major projects.

- Collect contract references to measure the success of empowering the Field Offices with certain Energy System Acquisition Advisory Board actions to assure responsible, cost-effective, and high value added decisions are made.

- Achieve cost avoidances through utility rate case interventions, and utility acquisition planning and management.

- Implement an automated facilities inspection process at all Department sites.

FY 1997 Planned Accomplishments: (cont'd)

- Complete Contract Reform actions and transfer the activity to the Deputy Assistant Secretary for Procurement and Assistance Management.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $706,000 is due to the reinstatement of awards and overtime ($301,000), the FY 1997 payraise and locality pay increase (145,000), other related salary expenses ($39,000), and inflation of 3.2% in contractural services ($221,000).

IDAHO OPERATIONS OFFICE

PROGRAM MISSION

The Idaho Operations Office (ID) is responsible for administering the Idaho National Laboratory (INEL), a multi-program Government-owned contractor-operated Laboratory in the areas of waste management operations; environmental restoration activities; nuclear safety research; test reactor operations, remediation projects, decontamination and decommissioning (D&D) activities, fuel consolidation efforts; biological and environmental research; nonproliferation and national security programs; coal and petroleum technologies; conservation and renewal energy programs; industrial partnering initiatives, Cooperative Research & Development Agreements (CRADAS) and technology transfer activities.

ID performs a wide variety of functions in support of energy activities throughout the country. Among these functions are field procurement, health and safety monitoring, property management, labor relations and maintenance of personnel, and financial systems. ID plans, develops, and administers budgets, and maintains an administrative staff to support on-going programs and projects. In addition, the field office has cognizance over thousands of contractor employees located at various locations.

GOALS AND OBJECTIVES:

Contract/Procurement

- Reduce processing time for placing procurements.
- Increase involvement in Small and Disadvantaged Business in all technical activities (especially engineering and construction).
- DOE-ID Performance Incentive Process.

Financial

- Improve systems for base lining, monitoring, reporting, and validating contractor cost savings.
- Implement an Executive Information System prototype aiding in management decision making (BMIS).

PROGRAM MISSION - IDAHO OPERATIONS OFFICE (Cont'd)

- Develop an Internal Budget process which enhances ID Program accountability and enhances budget reporting capabilities.
- Develop and implement a Cost Conscious Initiative which is an awareness/education program for ID employees.
- Complete a detailed analysis of the costs and savings associated with work force restructuring.
- Through contract reform, privatization and continued pressure to reduce overhead costs.

Personnel

- Increase diversity in the Department despite right sizing environment.
- Increase training opportunities for employees while emphasizing critical job skills in a right sizing environment.
- Meet Strategic Alignment full time equivalents goals.

Environment Safety & Health

- Reduce ES&H risk by performing compliance reviews and accomplishing compliance actions.

Program Evaluation

- Metrics are being created to establish baselines to be used as data points in performance evaluation. Historical accomplishments will be used as bench marks. Indicators will be identified, measured, and monitored enabling potential continuous improvement. Emphasis is being placed on outputs and results.

I. Mission Supporting Goals and Objectives:

The Idaho Operations Office (ID) is responsible for administering the Idaho National Laboratory (INEL), a multi-program Government-owned contractor-operated Laboratory in the areas of waste management operations; environmental restoration activities; nuclear safety research; test reactor operations; remediation projects, decontamination and decommissioning (D&D) activities, fuel consolidation efforts; biological and environmental research; nonproliferation and national security programs; coal and petroleum technologies; conservation and renewal energy programs; industrial partnering initiatives, Cooperative Research & Development Agreements (CRADAS) and technology transfer activities. ID performs a wide variety of functions in support of energy activities throughout the country. Among these functions are field procurement, health and safety monitoring, property management, labor relations and maintenance of personnel, and financial systems. The ID plans, develops, and administers budgets, and maintains an administrative staff to support on-going programs and projects. In addition, the field office has cognizance over thousands of contractor employees located at various locations.

II. Funding Schedule:

Activity	FY 1995	FY 1996	FY 1997	$Change	% Change
Total, Idaho Operations Office	$ 23,214	$ 20,006	$ 21,911	$ 1,905	9

III. Performance Summary: IDAHO OPERATIONS OFFICE

FY 1995 Accomplishments:

- Improved Environmental, Safety and Health (ES&H) programs at Idaho facilities as well as emergency preparedness. Other areas which have received increased attention in FY 1995 are safeguards and security, Chief Financial Officer initiatives, industrial partnering initiatives, Cooperative Research & Development Agreements (CRADAS) and technology transfer activities. ID had 36 patent applications, 186 invention disclosures, and 4 new companies start-up's as a result of their increased attention to these areas.

FY 1995 Accomplishments: (Cont'd)

- Idaho received an award presented by Secretary O'Leary recognizing contributions made on the Economic Diversity Small Business Goaling Enhancement Team. This team developed a Department-wide baseline of procurement dollars that will be used to establish realistic baseline goaling percentages with the U.S. Small Business Administration. This resulted in the Department being recognized as a leader among Federal agencies in small business participation.

- Idaho has increased its percentage of technical/professional to other skill mix from 38.3% in 1990 to 56% in 1995. Also a matrix organization has created a 17:1 employee to supervisor ratio; exceeding the DOE goal of 10:1.

- Completed implementation of ID's Financial Information Management System, which provides cost and budget detail by work breakdown structure, Budget and Reporting code, cost element, and organization.

- Through the consolidation, ID has reduced redundancy, leveraged technology, enhanced integration, challenged status quo, partially reinvest savings, and accelerated EM program. In FY 1995 Idaho awarded 25 CRADA's with a value of $43M, an increase in value of $33.6M.

FY 1996 Accomplishments (to date and planned):

- ID's focus will be on cost and results, not budget and FTEs. Consequently, we are creating an ID cost tracking system which will provide costs by OPS office product. This will enhance accountability of government dollars. In conjunction with the Strategic Alignment Initiative, ID will be reducing travel dollars and FTEs, while still maintaining an adequate level of support to HQ and Contractor oversight.

- ID will improve its businesslike performance by managing to cost, not budget; and incentivizing output not headcount.

- ID will establish 15 new Cooperative Research & Development Agreement (CRADAS).

FY 1997 Planned Accomplishments:

- ID's Business Management Information System (BMIS) will be on-line. This is an executive reporting system integrating cost data with work performed. It includes Contractor and ID data and will report necessary information pertaining to budget, cost, scope, head count, skill mix, and other personnel issues.

1042

FY 1997 Accomplishments: (Cont'd)

- ID will establish 15 new Cooperative Research & Development Agreements (CRADAS).
- ID will establish a privatized regional waste treatment center at the Idaho National Engineering Laboratory.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $1,905,000 is due to the reinstatement of awards (185,000), the FY 1996 and FY 1997 locality pay increase and pay raise ($244,000), personnel compensation for the increase of 7 FTE's ($893,000), increase in benefits commensurate with salary increase ($400,000), and inflation increases for other related expenses ($183,000).

OAK RIDGE OPERATIONS OFFICE

PROGRAM MISSION

The Oak Ridge Operations Office (ORO) supports the Department of Energy's (DOE) missions in National Security, Science and Technology, Energy Resources, and Environmental Quality. Technical functions to support these missions include dismantlement of nuclear weapons, basic research, energy technologies research and development, nuclear safety oversight of the gaseous diffusion plants, scientific/technical education and training, environmental restoration, waste management and asset management. Administrative functions to support these missions include budget and accounting, legal, personnel, labor relations, and staffing, telecommunications and automated data processing, procurement, contract management and contract reform, quality management, and environmental, safety and health (ES&H) oversight. In addition, administrative matrix personnel oversee the DOE Management and Operating (M&O) contractors and develop policies to govern their activities.

GOALS AND OBJECTIVES:

Goals include recognition of the changing missions of DOE and ORO and the creation of an infrastructure to support those changing missions by proactively focusing on cost reduction and implementation of DOE's strategic alignment and contract reform initiatives. In addition, ORO remains committed to priority initiatives involving the safety and health of employees and the public such as the activities of the Defense Nuclear Facilities Safety Board.

OBJECTIVES RELATED TO THESE GOALS:

- Accelerate the reduction of environmental risk.
- Reduce the Y-12 weapons footprint.
- Reindustrialize K-25 and Y-12 for commercial use.
- Revitalize the scientific infrastructure.
- Implement contract reform provisions in M&O contracts.

PROGRAM MISSION - OAK RIDGE OPERATIONS OFFICE (Cont'd)

- Improve systems for baselining, monitoring/reporting/validating contractor cost savings from conversion of M&O contracts to performance-based management contracts.
- Create public and private partnerships for regional economic development.
- Increase technical support to line management in ES&H/Quality Assurance areas.
- Utilize DOE's assets through metals recycle, sale of precious metals, and uranium disposition.
- Assure protection of the environment and promote the safety and health of employees and the public.

PERFORMANCE MEASURES:

- Average processing time from receipt of requisition to date of contract award.
- Total socioeconomic award dollars against pre-established goals.
- Enhancements in internal processes to efficiently and effectively project, plan, and staff the organization with sufficient internal controls to assure authorized staffing levels are not exceeded, while maintaining a high retention level of critical staff.
- Systems in place which provide ability to interface with all necessary entities, including internal organizations, as well as Headquarters other operations offices, and contractors.
- Percent of injuries/illnesses of Federal and contractor personnel.
- Trained employees to effectively and efficiently perform technical responsibilities in the of Business Management Reviews, DNFSB activities, and the Facility Representative and Quality Program.
- Increasing trend of timely and accurate payments and collections.
- Percent of costs deemed unallowable by internal and external audit reports.

I. Mission Supporting Goals and Objectives:

Goals and objectives include providing the support necessary to all Departmental missions in the most cost effective and efficient manner. This includes not only the routine support activities necessary to sustain these missions, but also the incremental support activities in priority areas such as Defense Nuclear Facilities Safety Board (DNFSB) activities, Chief Financial Officer initiatives, task order contracting and contract reform, technology transfer activities, safeguards and security and emergency preparedness activities and the promotion of the safety and health of employees and the Public.

II. Funding Schedule:

Activity	FY 1995	FY 1996	FY 1997	$Change	%Change
Total, Oak Ridge Operations Office	$ 35,911	$ 33,530	$ 36,484	$ 2,954	8

III. Performance Summary: OAK RIDGE OPERATIONS OFFICE

FY 1995 Accomplishments:

- Installed grant payment process improvements which saved two FTE staff on a continuing basis.
- Financial Management Division selected from a group of ten as one of the three DOE Financial Centers of Excellence. Transition plans underway to migrate and eventually consolidate financial databases and payment processes. Initiative approximately 45 percent complete.
- Provided services and support for approximately 600 Federal employees, including rent, utilities, telecommunications, maintenance contracts, and support contracts for ADP, ES&H, and administrative/technical and facilities support.
- Initiated and provided funding for an ORO automation initiative to bring ORO in line with current technology for a more efficient and cost effective operation. Initiative is 95 percent complete on bringing office automation processing up to current standards. Procured 250 Pentium PC's to replace obsolete 286 and 386 models; rewired the Federal Building to provide both voice and data up to 100 megabyte capacity to the desktop; replaced the All-In-One E-mail system with cc:Mail; and procured software upgrades.
- Significant progress by the M&O contractor, Lockheed Martin Energy Systems, in developing a site-wide WBS organization concept, including an automated "task-based" management system, which will enhance ORO's ability to plan, budget, and execute work.

FY 1995 Accomplishments: (Cont'd)

- Renegotiated the Lockheed Martin Energy Systems contract to convert to a performance-based contract.
- Exceeded the goals for awards to small disadvantaged, minority-owned, and women-owned businesses.
- Implemented several initiatives to streamline the procurement process, including streamlining the closeout process, the review of subcontracts, and the competitive procurement process.
- Oversaw completion of 38 construction projects with a combined total estimated cost (TEC) of $87,000,000 in the Environmental Management program; completion of two significant line-item projects and the last two weapons systems line-item projects in Defense Programs; completion of two Facilities Capability Assurance Project (FCAP) projects; and the reduction of general plant project (GPP) schedules by an average of three months with a projected savings of $500,000.
- Developed Interim Qualification Program for facility representatives, including the development of oral evaluation instruments; and procured in-house courses for facility representatives in Construction Safety.
- Radiological Assessment, Technical Safety Requirements, Accident Investigation, Operational Readiness, Occupational Safety and Health. Environmental Management. and Environmental Laws and Regulations.
- Assisted Y-12 Restart effort by revising position standards and Individual Development Plans for all technical employees and developing study guide to DOE 5480.19.
- Participated in the development of interface concepts of operations and communications links between ORO, K-25, and the state in order to complete the State of Tennessee Multi-jurisdictional Plan for Operational Emergencies at K-25.
- Facilitated obtaining equivalencies or exemptions to DOE fire protection requirements that have saved approximately $4,000,000 in FY 1995 by sustaining an average fire loss rate for ORO of approximately 0.01 cents loss per hundred dollars of replacement value as compared to the average private sector loss of 0.70 cents per hundred dollars.
- Provided direction and support to DOE programs and contractors in the area of transportation and packaging resulting in an estimated savings of $5,000,000 through technical assistance activities and trained 175 personnel in transportation regulatory compliance.
- Accomplished organizational and strategic realignment in order to meet Departmental streamlining goals and reach a 1:10 supervisor-to-employee ratio with essentially no disruption to mission accomplishment.

1047

FY 1996 Accomplishments (to date and planned):

- Negotiated major revisions to personnel cost portions of two M&O contracts (Southeastern Universities Research Association [SURA] and (LMES) which resulted in significant streamlining of the contracts by reducing transaction approvals required under each contract (moving to DOE review of major programs, rather than individual cases) and placing increased accountability for performance results on the contractor.

- Executed a performance-based management contract extension with Lockheed Martin Energy Systems for the management of environmental management, energy research, and defense programs missions under the cognizance of Oak Ridge Operations Office. The contract extension focuses on objective and incentivized performance measures, multiple fee arrangements, and cost reduction opportunities.

- Executed a separate contract for management of Oak Ridge National Laboratory with the award of a performance-based management contract to Lockheed Martin Energy Research Corporation. This separate contract allows the laboratory greater visibility, comparability with other national laboratories, and increase focus of resources on science.

- Began utilizing incentive task orders (ITOS) under the Lockheed Martin Energy Systems contract for selected environmental restoration and waste management projects. ITOS's are typically cost-plus-incentive fee arrangements for individually negotiated projects with specific cost and performance incentives. The contractor assumes more risk under the task order but is also rewarded for better performance, and the Government reaps the benefits of better contractor performance and reduced costs.

- Streamlined the ORO review process for Lockheed Martin Energy Systems, Inc. Subcontracts and reduced the time required for review from 46 days to 6 days, resulting in an overall cycle time reduction of 87 percent.

- Formed an ORO Partnership Group to focus on (1) establishing partnerships for technology transfer and economic development with other Federal agencies, universities, State/regional governments, and private industry; (2) reindustrializing Oak Ridge sites; and (3) cultivating an outreach and development function for new projects.

- Executed Memoranda of Cooperation with local governments, including the City of Chattanooga and the City of Knoxville and Knox County for sustainable development and economic growth.

- Develop an acquisition strategy for future management of ORO missions and facilities.

- Provide services and support to the Federal work force for the same activities as in FY 1995; however, costs are increasing due to normal annual increases, as-well as reliance on computing and telecommunications increasing and causing increased costs.

- Continue upgrade of office automation by procuring hardware/software to retire the remainder of the inadequate PC's and continue software upgrades; procuring, installing, developing systems such as Travel Manager, Stride, and full access to INTERNET; bringing in the Voicemail portion of the ORF-ICN which will preclude the need of ORO and contractors to continue using separate, inadequate, and cost inefficient voicemail services; and completing initiative begun in FY 1995 to define an optical disk storage system that can facilitate electronic movement of documents as opposed to paper.

FY 1996 Accomplishments: (Cont'd)

- Consolidation of financial databases and payment processes for the Financial Center of Excellence 100 percent complete.
- Complete 50 percent of the development and design of facility-specific training modules, on-the-job training guides, and facility-specific exam banks for some 50 facilities. Procure training courses in the areas of hazardous wastes, fundamentals of operations, emergency preparedness, site access, and criticality safety.
- Complete implementation of the Emergency Management Network, which will provide a computer data link for transfer of emergency information between the Oak Ridge area sites and the state of Tennessee.
- Reduce costs of excessive ES&H oversight by relying more on outcome-based measures such as ES&H performance indicators, trending, and analysis. Only one major DOE oversight activity will be conducted at ORNL, and it is expected that researchers will spend less time responding to audit and appraisal findings.
- Continue providing direction and support to DOE programs and contractors in the area of transportation and packaging that will result in a cost savings of approximately $2,000,000.
- Accomplish strategic realignment to reduce overall staff by a minimum of 81 positions while meeting critical mission requirements and positioning ourselves for further reductions in the following years.

FY 1997 Planned Accomplishments:

- Complete five major projects (three of which are task order projects) underway at K-25, Y-12, and ORNL.
- Continue to streamline the procurement process.
- Re-evaluate network operating environment and transition to nonproprietary INTEL-based network environment.
- Complete 100 percent of the development and design of facility-specific training modules, on-the-job training guides, and facility-specific exam banks for some 50 facilities.
- Complete implementation of the ORO Emergency Operations Network, which will provide computer links for transfer of emergency information between the seven major ORO sites and the ORO Emergency Operations Center.
- Continue efforts to reduce cost of excessive ES&H contractor oversight.
- Continue to provide direction and support to DOE programs and contractors in transportation regulatory compliance that will result in a savings of approximately $2,000,000.

1049

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $ 2,954,000 is due to the reinstatement of awards and overtime ($385,000), the FY 1996 and FY 1997 locality pay increase and pay raise ($1,113,000), personnel compensation for the increase of 6 FTE's and temporary employees ($550,000), increase in benefits commensurate with salary adjustments ($319,000), increase in contractual services ($269,000), rental payments ($100,000), and inflationary increase in other related expenses ($218,000).

1050

OAKLAND OPERATIONS OFFICE

PROGRAM MISSION

The Oakland Operations Office (OAK) is responsible for administering several Government-Owned Contractor-Operated Laboratories including Lawrence Livermore National Laboratory (LLNL), Lawrence Berkeley National Laboratory (LBNL), Stanford Linear Accelerator Center (SLAC), and the Energy Technology Engineering Center (ETEC). The office also oversees DOE research at the Laboratory of Radiobiology and Environmental Health at the University of San Francisco (UCSF), the Laboratory of Laser Energies (University of Rochester), Naval Research Laboratory (NRL) and numerous industrial contractors (e.g., General Atomics, General Electric, and Rockwell) and grants.

OAK oversight responsibilities include program and project activities in the Department of Energy's Major Missions. These programs include: National Security Programs R&D, National Security, High Energy and Nuclear Physics Programs, Fusion Energy R&D, Basic Energy Sciences, Biological and Environmental Research, Nuclear Energy Program, Decontamination and Decommissioning and other Environmental Restoration and Waste Management efforts, Energy Efficiency and Renewable Energy, and Fossil Energy programs as well as oversight of the Work for Others activities.

OAK performs a wide variety of functions in support of energy activities at various contractor sites. Among these functions are field procurement and contract management, health and safety monitoring, property management, labor relations, and personnel and financial management. OAK prepares and administers budgets and maintains a technical and administrative staff to support ongoing programs and projects for numerous Program Secretarial Offices. In additional, OAK has cognizance of 12,300 contractor employees located at national laboratories and other facilities. This budget supports the Federal staff required to carry out these crosscutting administrative and oversight responsibilities not applicable to any single DOE Program.

Strategic Alignment

OAK is implementing the Secretary's Strategic Alignment Initiative (SAI). The OAK Field Chief Financial Officer was a part of the SAI team that developed the plan and several staff members from the OAK office are actively participating on various teams to implement the 45 recommendations. Just as the OAK Office supported the National Performance Review and the Secretary's Streamlining Plan to increase employee to supervisor ratio in FY 1994, OAK is vigorously pursuing efforts to meet the recommendations outlined in the SAI.

GOALS AND OBJECTIVES

- OAK and it Laboratories to remain a major source of scientific and technical information for industry, state, and local government, educational institutions, and small and disadvantaged businesses;
- OAK recognized as a leader in developing and implementing model management systems and work processes designed to provide quality products with superior customer service;
- OAK is the acquisition office of choice for DOE/HQ and other DOE customers/stakeholders;
- OAK is transition from a compliance/transaction-oriented contract administration to performance-based, efficient, systems-oriented contract management of the Laboratories;
- OAK to achieve ES&H excellence oriented towards efficient, risk-based systems management. Using performance measures contained in the University of California contracts, consistent overall improvements in ES&H has been demonstrated. OAK will continue to improve ES&H performance measures in the University of California contract by incorporating more leading and behavioral indicators and will develop performance measures for inclusions in the Stanford Linear Accelerator Center contract renewal.
- The performance-based management philosophy has resulted in the identification of key performance objectives in personnel property management. Performance objectives have resulted in increased visibility on desired results, thereby promoting enhanced performance in key areas.
- During FY 1995, performance-based management resulted in continued performance improvements in OAK's personal property management program. Perhaps most notably, the trending of personal property inventory data has resulted in increased inventory effectiveness. In fact, inventory results reflect over 99.5% of property as being located and accounted for. While performance in critical areas has improved, property management staffing levels have decreased measurably throughout the OAK complex.

Management

- Contribute to the goals and objectives of the Strategic Alignment Team.
- Implement Business Oversight Reviews as outlined by the Office of Field Management.
- Continue to partner with laboratories on performance measures

1052

GOALS AND OBJECTIVES - Cont'd

Financial

- Improve systems to enhance OAK and its contractor's costs savings, which includes utilization of the Management Analysis Reporting System (MARS) and participation in the Financial Management Systems in Improvement Council (FMSIC).

Contract/Procurement

- Continue to enhance contract reform at OAK.
- Increase performance based contracting.
- OAK has performance-based measures in two of our Management and Operating (M&O) contracts and is working to get performance measures in another M&O contract.

Project Management

- Meet annual milestones of each project within budget and on schedule.

I. Mission Supporting Goals and Objectives:

Provide oversight to program and project activities in: National Security, High Energy Physics and Nuclear Physics Programs, Fusion Energy R&D, Basic Energy Sciences, Biological and Environmental Research, Nuclear Energy Program, Decontamination and Decommissioning and other Environmental Restoration and Waste Management efforts, Energy Efficiency and Renewable Energy, and Fossil Energy programs. In addition, OAK provides oversight of the Work for Others activities.

Support Energy activities at various contractor, sites by performing functions including: field procurement and contract management, health and safety monitoring, property management, labor relations, and personnel and financial management.

Prepare and administer budgets, maintaining a technical and administrative staff to support ongoing programs and protest for numerous Program Secretarial Offices.

II. Funding Schedule:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Total, Oakland Operations Office	$ 23,828	$ 21,173	$ 23,249	$ 2,076	10

1054

III. Performance Summary: Oakland Operations Office

FY 1995 Accomplishments:

- Given declining human and financial resources, OAK has initiated steps in repositioning resources to meet future needs and customer requirements. To continue providing superior customer service, OAK has implements a skills bank that properly utilizes employee skills to meet our unfolding future. Further, implementing the 360 degree performance system that provides individual action plans and highlights accomplishments.
- OAK radically exceeded goals set forth in the FY 1995 budget by: administering 1,310 contracts and grants, performing 176 contract and grant closeouts and performing 49 ES&H reviews.
- The OAK office provided oversite of approximately 31 line-item construction projects and General Plant Projects for six DOE programs at three MSO contractor sites.

FY 1995 Accomplishments: (Cont'd)

- OAK provided staff necessary to assist in the reduction of directives; consequently, the steering committee assigned to this project has eliminated burdensome/no-value-added directives.

FY 1996 Accomplishments (to date and planned):

- Continue to conform to the Secretary's Strategic Alignment Initiative (SAI) and the National Performance Review as outlined for FY 1996.
- Reduce travel costs by 25%.
- Reduce Capital Equipment costs by over 60%.
- Reduce lease rates by 1/3 from FY 1995 charges.
- Continue to decrease processing time for placing procurements.
- Reduce backlog of contracts in "close-out" from previous years.
- Continue ES&H compliance reviews.

FY 1997 Planned Accomplishments:

- Include cost cutting strategies in our joint strategic plans with laboratories.
- Jointly report on results and determine additional cost saving requirements.
- Review and refine the University of California and Stanford University performance measures.
- Complete evaluations of overall performance measurements.
- Continue to provide full mission support of the SAI.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $2,076,000 is due to the reinstatement of awards ($252,000), the FY 1996 and FY 1997 locality pay increase and pay raise ($640,000), temporary personnel compensation ($219,000), increase in benefits commensurate with salary adjustments ($321,000), other base salary adjustments ($260,000), and inflationary increase in other related expenses ($384,000).

FIELD OPERATIONS PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities:

The Office of the Associate Deputy Secretary for Field Management (Field Management) provides managerial oversight of the eight Operations Offices and the Ohio and Rocky Flats Field Offices. It also provides management and oversight of the Department's life cycle capital asset program which includes project management, real property management, utilities, maintenance and facilities efforts.

Field Management is also the lead office for a number of Departmental initiatives including Strategic Alignment, Contract Reform, and consolidation of Headquarters oversight activities.

Additionally, Field Management has responsibility for those portions of the Chicago, Idaho, Oakland and Oak Ridge Operations Offices manpower and administration activities previously funded within the Department's Departmental Administration account.

1056

Program Direction has been grouped into four categories:

Salaries and Benefits provides for institutional management and/or matrix support of the programmatic mission and support of all programs under the purview of the field offices and resource management, infrastructure requirements, and project and facilities management under the purview of the Office of Field Management located in Washington D.C.. Support functions include budget and accounting, legal, patent, personnel, labor relations, staffing organizational management, freedom of information, telecommunication, space management, logistical services, automated data processing development and acquisition, contract management, procurement, personal property management and environmental health and safety assessment. In addition, matrix employees perform oversight of the DOE Management and Operating contractors in the performance of activities in their respective functions. Included are payments to employees for Voluntary Separation in Pay (VSIP) and their leave balances. In FY 1997 there are 75 scheduled buyouts at $3,000,000.

Travel provides the field offices the opportunity to participate on task teams, work various issues and formulate policy at headquarters and to conduct compliance reviews, oversight of contractors' implementation of DOE orders and regulatory requirements at the facilities under their purview. Provides for the Office of Field Management staff to travel to the eight Operations Offices and the Ohio and Rocky Flats Field Offices for the purpose of management coordination, infrastructure requirements, and project management reviews. Provides for attendance at conferences and training classes, and permanent change of station.

FIELD OPERATIONS PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities: (cont'd).

Support Services provides for centralized and administrative support of the Operations Offices included in this account and the Office of Field Management.

Other Related Expenses provides for rent and utilities for the Idaho Operations Office, Oak Ridge Operations Office, Oakland Operations Office and the Office of Field Management's office space and two other facilities supporting program FTE's located at the Oak Ridge Operations Office. Provides for expenses supporting the field offices and the Office of Field Management; telecommunication, postage, printing, reproduction, building operations, logistical services, automated data processing development and acquisition, employee development and training, health services, shipment and storage of household goods, supplies, furniture and vehicle and office equipment maintenance and capital equipment. In addition, provides for Independent Cost Estimates, technical support in contract negotiation between the Department and public utilities, analysis of project research and development efforts, and project reviews conducted by the Office of Field Management.

* 14 FTE's for the Office of Contractor Employee Protection were transferred to the Office of Inspector General in FY 1996. The FTE's were budgeted and paid by the Office of Field Management in FY 1995.

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- The Office of Field Management, eliminated thirteen Department of Energy orders and replaced them with the Life Cycle Asset Management Directive creating a corporate facilities "cradle to grave" approach, saving an estimated $51 million annually.

- The Office of Field Management, saved an estimated $19.8 million annually through the competitive procurement of electric power at the Nevada Test Site ($1.4m), the privatization of the Savannah River D-Area Powerhouse ($10m) and managed the competitive acquisition of natural gas at 17 Department sites ($8.4m).

- The Office of Field Management avoided cost of an estimated $176 million through the coordination of corporate practices for value-engineering and the participation in eight utility rate interventions for Department sites.

- The Chicago Operations Office and the University of Chicago completed negotiations and executed the first performance-based management and operating contract for operation of a major DOE laboratory by a not-for-profit organization. The new Argonne National Laboratory contract incorporates key objectives of DOE's Contract Reform Initiative including: a fully incentives performance fee; assumption of increased risk associated with financial liabilities; performance-based management; and agreed upon cost reductions. The new contract is projected to save approximately $77 million savings through September 30, 1999.

- The Chicago Operations Office examined and streamlined the process for National Environmental Policy Act (NEPA) documentation based on Total Quality Management and continuous improvement, replacing a cumbersome, time-consuming, manpower intensive process. The new process will result in a 10-fold reduction in cycle time, a 5-fold reduction in cost, and increased responsiveness to protect schedules.

- The Idaho Operations Office Organizational Streamlining Plan has increased its percentage of technical/professional to other skill mix from 38.3% in 1990 to 56% in 1995. Also a matrix organization has created a 17:1 employee to supervisor ratio surpassing the Departmental goal of 10:1.

- The Oakland Operations Office exceeded goals set forth in the FY 1995 budget by: administering 1,310 contracts and grants, performing 176 contract and grant closeouts and performing 49 ES&H reviews.

FIELD OPERATIONS PROGRAM DIRECTION

III. Performance Summary: (cont'd)

- The Oakland Operations Office provided oversight of approximately 31 line-item construction projects and General Plant Projects for six DOE programs at three MSO contractor sites.

- The Oak Ridge Operations made significant progress by the M&O contractor, LMES, in developing a site-wide WBS organization concept, including an automated "task-based" management system, which will enhance ORO's ability to plan, budget, and execute work.

- The Oak Ridge Operations Office negotiated major revisions to personnel cost portions of two M&O contracts (Southeastern Universities Research Association [SURA] and LMES) which resulted in significant streamlining of the contracts by reducing transaction approvals required under each contract (moving to DOE review of major programs, rather than individual cases) and placing increased accountability for performance results on the contractor.

FY 1996 Measurable Performance Activities:

- The Office of Field Management will implement a Comprehensive Landlord Integrated Facilities Planning Process with an emphasis on site strategic planning and budgeting for the Department.

- The Office of Field Management will lead Departmental initiatives to improve and reduce field office and contractor oversight along with other contract reform issues and collect performance measurements for reform pilots in place and will lead efforts to institutionalize within the Department.

- The Office of Field Management will implement Life Cycle Asset Management Directives promoting corporate facilities cradle to grave approaches for the acquisition, management operations, and disposal of the Department's infrastructure assets and obtain performance measurements for the Department's Annual Performance Plan. This will include the merging of two offices into a single unit, increasing productivity and customer service.

- The Chicago Operations Office will execute the first year of a five year performance-based management and operating contract with Argonne National Laboratory and Brookhaven National Laboratory.

- The Chicago Operations Office is in the process of concluding performance based management contract negotiations with Princeton Plasma Physics Laboratory and Fermi National Accelerator Laboratory.

III. Performance Summary: (cont'd)

- The Idaho Operations Office focus will be on cost and results, not budget and FTEs. Complete a cost tracking system at Idaho Operations Office to provide costs product. This will support cost reduction in administrative and support cost and improve contractor oversight.
- The Oakland Operations Office key accomplishments for FY 1996 are focused on reducing travel(20%) and capital equipment(60%), lease rates by 33% from FY 1995 levels, continue to decrease cycle time for placing procurement and reduce the backlog of contracts in "close-out" from previous years.
